**The New Parish Offices**, in Birmingham, were opened on Tuesday. The building, which stands at the corner of Newhall Street and Edmund Street, will cost about 35,000*l.*, and was designed by Mr. W. H. Ward.

## PRINCIPLES OF ARCHITECTURAL DESIGN.\*

BY G. F. BODLEY, A.R.A.

SOME of those principles and characteristics of architectural design which I would bring before you to-night are:—Refinement, concentration, true use of detail, symmetry, economy of material, contrast, avoidance of extravagance of manner, suitability, harmony, colour, work founded on that of the past, consonance with nature, lastly truth.

### *Refinement in Design.*

Now if there is one principle in the practice of architecture in the present day which is chiefly wanting, it is the lack of refinement of design. What is the history of architectural art but the history of refinement in the art? What was the one principle that led on from century to century, from style to style, but that of a true artistic feeling—the desire for refinement? Nature, our great guide, never stops in her refinement. We cannot gauge the infinite delicacy of nature, nor her redundancy of life and its variety. Now it is in refinement for architectural work that this expression of life is chiefly shown. According to the material and means at command, there should be the careful expression of artistic power to bring out to the utmost the expression of life. This expression is a great principle of all art, and one to which limits can hardly be assigned. It should animate all your work. Every detail, not only as in the carving of natural ornament, however conventionalised, but in architectural mouldings and the like, should express this, which is the highest gift of Nature—*life*. You see it in all good architectural work, in the branching vault, and the graceful clustered column, from which it springs, in the steady, sturdy, but thrusting buttress; in the varied modelling of carved ornament, or even in the mouldings of a cornice or of a string-course. Whatever in architectural work is endowed with the expression of death is bad art. Good art, on the contrary, is ever imbued with the expression of life.

### *Concentration of Ornament.*

Another principle is that of concentration of ornament, especially for our larger buildings. It is one too much neglected in modern architectural works. For the enjoyment of richness and beauty of ornament there should be a well-designed concentration of it. The eye wearies of, and the mind fails to be interested with, a monotony of richness. Design your building in good proportions—that is, with the proportion that has an expression suiting the character you wish to give your work. Then enrich the chief and most important parts with carefully-designed ornament, rather than sprinkle the whole with it. Here, of course, the scale of the building dictates the character, and it is no fault for a small one to be enriched all over; it is, as it were, a detail itself. The surrounding buildings may give the necessary effect of contrast, but for large and monumental works you will find this concentration of ornament a sound and judicious principle. It is one of the characteristics of the best old buildings.

### *True Use of Detail.*

Another principle is that of the true use of detail. Now the use of detail is not so much in order to show variety, or beauty of design, but that it may enhance the expression, whatever that may designedly be, that is to be given to the whole building. It is surprising how the use of detail, skilfully dealt with, may add scale to a building and enhance its general effect. It is a great but manifest error to suppose that by boldness of detail you make your buildings look large. The reverse is eminently the case. This is obvious. Nevertheless, much modern Gothic work, and not work in that style alone, has been ruined in effect by largeness, if not coarseness, of detail. When your mouldings are large their curves should be especially delicate and subdued. The delicacy of the shadows prevents the effect of any coarseness. Not that it is only detail which, carefully used, gives scale to a building. The multiplication of parts is an arrangement of much use for this purpose. You know how skilfully this was done in Mediæval and in Renaissance buildings. The study of the best designed ancient works will make the intention very apparent. It is a point, again, that you can work out for yourselves in studying such buildings. Compare, for example, Milan Cathedral with our Westminster Abbey, or with York Minster or other great Gothic churches. To give scale by breaking up a wall into stages, as by arcades and the like, is of frequent occurrence, and is of much effect.

### *Balance in Design.*

Another principle on which I would touch is that of symmetry or balance in design. It is one for the most part applicable and of chief use for large buildings and those of monumental character; nevertheless, a house of moderate dimensions, planned on a symmetrical arrangement, may have

\* From a lecture delivered at the Royal Academy on February 20.

a repose and a dignity fitting many sites. Our large Elizabethan houses owe much of their effect externally to this arrangement. It is not a Gothic idea; nevertheless, even for this style, a forced irregularity is always to be avoided. There is no plan for a large house, standing by itself, more dignified and quiet in effect than one with three sides of a quadrangle—the entrance, with its high porch, marking the centre, and bearing, it may be, an enriched panel with shield and other sculptured ornament. The two projecting wings may be of more or less projection, as circumstances dictate. In these symmetrical designs occasional variation from exact balance may well be brought in, as in the somewhat varied positions or sizes of windows, and the like. The general balance may be kept, but, like an unexpected note in music, the variation in no way destroys the general effect of harmony. Symmetry of design denotes care and pains on the part of the designer. It is a courteous manner, and has much to recommend it. Certainly it is a principle founded on nature. It was in constant use in old days.

#### *Economy in the Use of Material.*

Another point is that of a nice economy in the use of material. It is again another point of refinement. The almost brutal strength and ponderous use of material on the Egyptian work, especially as in the Pyramids, has an unpleasant sentiment. Contrast this with the great Gothic buildings in which (with no economy of thought or of skill), through delicate ribs of curved or straight stone, the weight of the hanging vault is held, as if by magic, and passed down into the ground—all with the nicest economy and without any undue waste. Each member does its work. It is Christian liberty and carefulness contrasted with Egyptian slavery and its waste of power. Roman work had some of this Egyptian-like waste. Engineers make their nice calculations, of less and more, and tell us this or that “will stand.” But good architecture is not only “built to stand”—it is built to last from generation to generation. It is no waste to build in such a manner that the eye and the mind are satisfied that centuries may see the building as we see it now; that if but properly tended, and not cruelly dealt with by the more ruthless hand of man, the gentle, slow, natural decay of time will leave the inheritance well nigh untouched. Such strength, combined with a nice economy, should be our aim in designing buildings.

#### *Contrast.*

Another principle is that of well-contrasted work. In all the best architecture you will find a noble simplicity of design, due breadth of surface, contrasted with delicate detail. Neither has its full value without the other. How well the delicate Gothic traceries and niche work, and the lines of the richly carved cornices, contrast with the broad surfaces of the massive buttresses and the smooth ashlar of the walls. It is thus in nature you may see the delicate foliage and the fragile flower contrasting with the buttress-like rocks, smoothed by the hand of time. Some of the best effects of Gothic work are obtained by the use of thick walls and small detail, as in windows where the broad splay is finished by a slender shaft, giving a fine line of light and a delicate shadow, contrasting with the uniform light on the wide breadth of surface of the splayed jamb. Here, again, you can work out this principle for yourself in many ways, both as shown in examples of the past and in designing new buildings or their details. In many churches in the South of France we see the capitals throughout, both large and small, elaborately and richly carved, while the rest of the building is of the sternest simplicity. The capitals form, as it were, rich bands, contrasting with the plain walls and piers. Again you will find that the whole practice of mouldings is derived from the sense of contrasted light and shade. Vigorous, at times even harsh, as in some early Gothic work, the system of mouldings became gradually refined to the most gentle gradations of light and shade, the simple roll moulding eventually turning into what is termed the “wave moulding,” with the most delicate effect of light and shade on its surface. Or, again, in carved work of the great times, the delicate lines of light on the ridges and the edges of the ornament, the half shadows, tender and slight, on which the ornament seems, as it were, to rest, then the sudden deepening and darkening of the background, to throw out in strongest contrast the chief points of the ornament into greater light, to rule over the rest. Well considered and ably executed, contrast is seen everywhere, full of tender grace or decided vigour. The carver has delighted in the effect nature affords everywhere, where there is light to see its subtlety. It is our loss that here, in England, our dark days are so frequent. The want of light has, no doubt, a depressing effect on art. Let us the more carefully enlighten our mind's eye with the thoughtful contemplation of the works of other and sunnier countries and of brighter days of art.

#### *Exaggeration of Design.*

Another suggestion that I would make is a negative one—the avoidance of extravagance of design and manner. For

example, avoid extravagant proportions. One has seen too much of this of late in Gothic work. A shaft only two or three times its diameter in height is surmounted by a capital out of all proportion to that shaft. It is an ugly affectation and in no way commendable. It is an exaggeration that becomes a caricature of good art. There is one kind of strongly-marked proportion, however, that we need hardly fear to carry out in these days—I mean that of considerable height. The controlling exigencies of economy too often prevent our churches, for example, from rising into stately and inspiring proportions. You know the high proportion of that, perhaps the most beautiful of all Gothic churches in the world, Westminster Abbey—the most beautiful as regards the architecture of the interior. The proportion of Westminster Abbey, that of three squares, is excellent, and without any undue exaggeration of height. The extravagance of manner I have spoken of more often lends itself to stumpy proportion, without grace or beauty. It is, like other extravagances, to be avoided.

#### *Suitability to Position.*

Another principle I would bring before you is to suit your design to the place it is meant for, and to the surroundings among which you are to build. With our old buildings in the country one sees an instinctive harmony with the sentiment of the aspect of the natural scenery, or, it may be, a wise contrast with it. It was not apart from this refined feeling that for an old Gothic church, built among hills, you will generally find a low broad tower, with an affinity for the masses of surrounding scenery; while, on the other hand, on the long, low, level lands the pointing spire will have been lifted in contrast to the horizontal line of the plain, a point of relief which the traveller's eye may rest on as he travels through the monotonous level country. In towns you may take pains, in some way, to assimilate your building to those of neighbouring ones of former times, if there be any of sufficient interest to command such respect. It is to our loss that so many towns in which we may have to build are destitute of any character with which we can harmonise our work. Nevertheless, it should be done where possible, not only in the use of local material, but in designing in the local manner, and in harmony with the surrounding buildings. One sees examples of what we must call “bad manners” in this way. The surroundings have been ignored. And here let me say that we need not go abroad to find a style in which to design buildings in England. Let us keep to the “genius loci.” Both in Gothic and Renaissance buildings among us there has been too much copying of a foreign manner unwisely imported from the Continent. Our own English architecture is second to none on the Continent for beauty and poetry of design. If abroad the architecture is more grandiose, yet it often lacks the refinement and the poetry of sentiment of our English work. Though “art speaks the tongue of every clime,” yet, in a sense, we may have a patriotism in our art.

#### *General Harmony.*

Another principle is an obvious one—that of harmony, not only of style, but of character and feeling throughout a building. No eclectic school, which mingles styles incongruously, will ever be long lived or successful. The result, if not one of continuous discord, affords but occasional harmony. It is true that certain styles, as Gothic, lend themselves to strong construction, while Renaissance may be more consonant with great richness and delicacy of detail, as, for example, in plaster-work and the like; but there is a risk of discordant character. It is better not to attempt any such mingling of styles in a complete work, however good the effect of different styles combined may be in an historical building which has been added to from time to time. The mind is satisfied with such an historical building, but it is irritated by the needless conceit of combined styles in a new one. If you look at any complete work of the great periods you will find that they have a unity of feeling and a breadth of effect stamped upon them. Look at our abbeys of Westminster and Tintern. I mention these, for you know them well. The same character is given to the whole building in a marvellous degree. Each building expresses, in its own distinctive manner, the sentiment desired, and there is a true artistic breadth of effect and of idea. You will find this so in all complete buildings of the great periods. They are interpenetrated with one idea, though there is the utmost variety of detail.

#### *The Use of Colour.*

Another and an important part of an architect's work is connected with colour, whether in the use of marble or other constructional colour, or in painting. A fine eye for colour is a natural gift, as much as a fine ear for music; but the love of good colour may, no doubt, be caught from the teaching of nature and the great schools of painting, chiefly those of the fourteenth century and later on. However poor the architectural character of our houses may be, beauty of colour may be obtained for our rooms. There is not enough intelligent interest spent on the subject of the decorative effect of our

houses. I cannot but express the hope that they may be made more beautiful in colour, and that our rooms may show, not only a jumbled collection of old things, however beautiful these may be in themselves, but that intentional design and harmonious architectural character may be given to them.

In the modern decorative treatment of rooms, even those of some dignity, one too often sees mistakes of the most evident kind. For example, it is the frequent modern practice to colour the cornice of a room as if it were part of the ceiling; so if the ceiling is white the cornice is white also, though the walls and woodwork be of colour. Now surely the cornice is the crown of the wall, and not a part of the ceiling. The architectural value of a cornice in a room is to soften off the harsh line that we get without any projecting moulding. This effect is obviously lost if the cornice is coloured like the ceiling, and not like the wall. I would just say, before quitting this part of our subject, that while we now often see "dados" introduced, the use of the frieze is too seldom adopted; yet it is a far better effect to have a well-designed frieze and no dado rather than to have a dado and no frieze. The frieze, and not the dado, was the earlier arrangement. Let me say, in passing, that we should do better, in our domestic work, to follow the style of the Renaissance rather than that which is called "Queen Anne," and which is a very inferior manner at best. Again, there is a fashion for a papered dado. This brings out with undue prominence the poor, thin line of the dado moulding. Now, this dado moulding, or "chair rail," is, as it were, the cornice of the dado, and the whole should be of the same colour. Above this dado moulding there may be a wall-paper of good pattern and colour. Such a paper is best when it is of two or three shades of the same colour, and the spotty and unarchitectural effect of a variously coloured pattern is avoided. Wall-papers were the successors of damask silk hangings, which were usually of one colour, or different shades of the same colour. These silk hangings, it is true, were the successors of tapestry of varied colour, but the pictured scenes of tapestry take one into a higher and altogether different kind of decorative effect. There is nothing in common with tapestry in them, except that both are for the clothing of a wall. Again, one sees other palpable mistakes of colour, such as the use of the "black pointing" of brickwork. We need not add to the gloom and dinginess of our buildings by its use. But what I would chiefly urge on this subject is, that you should not think decorative art in any way beneath your serious attention. Here, again, look at the works of the past, of the great schools of Europe. They will be of more use to you than the imitation of Japanese or Chinese work, the fashion of the day, however ingenious it may be.

#### *The Study of the Past.*

Another principle is the founding designs on the works of the past. Sir Joshua Reynolds said:—"The more extensive your acquaintance is with the works of those who have excelled, the more extensive will be your powers of invention, and, what may appear still more like a paradox, the more original will be your conceptions." This is, I think, eminently true of architectural design. You may well found your design on some previously executed work that has won your respect and admiration; but you make it your own, your mind's eye seeing it, thus or thus, different, wholly altered, from that which produced the idea. It is thus that art hands on, in the tradition of art, the spirit of it, which is immortal.

#### *Consonance with Nature.*

Another principle is that of harmony and consonance with nature. We have incidentally spoken of nature as the guide in all art. It should be eminently so with the creative art of architecture. Though our art, like music, is not an imitative one, yet its characteristics should be those of nature in the spirit, though not in the letter. It is the strength and the delicacy, the refinement and the richness, and the other great attributes of nature which we should endeavour to embody in our works, rather than any exact imitation.

#### *Truth.*

Of truth as expressed in architecture much has been written, and written well, more especially by Mr. Ruskin, to whose teaching we owe so much in the whole field of art. Truth is an essential element of good art. I need not dwell on this part of our subject. Nevertheless, what are many of our new street fronts in the City, and other buildings elsewhere rising around us, but examples of most untruthful architecture? Iron columns and iron girders are concealed by stone columns and thin stone friezes and the like deceptions. It is an unpleasant, and indeed a wretched, style of building, without truth or dignity. Should a fire try the nature of the work, the writhing columns and the bending girders will soon show that they are found wanting in that first necessity of good building—stability—and the disguise will be manifest.

**A Memorial of the late General Earle, who was a native of the city, is to be erected in Liverpool.**

## TESSERÆ.

### *Originality in Architecture.*

SIR SAMUEL FERGUSON.

TO be original is a privilege but rarely vouchsafed to the architect. The laws of epic or dramatic unity impose no shackles on the man of letters at all to be compared with the rigour of those which bind the artist who must express himself regularly in stone. If he can impress with a sense of majesty, if he can elevate and at the same time expand the soul, if he can communicate a perception of elegance, grandeur, and harmony, these will be his triumphs; but in proportion as he rises towards these heights of his art, he will leave individual peculiarities behind, and in the attainment of perfection pass far beyond the reach of any influence of egotism. If he have a style by which his works may be known from those of other men, it will be felt in their general impression, not offered to attention in their details; for of so universal and absolute a character is architectural perfection, such as we may conceive it, that, as in sculpture, the very test of excellence might be that the masterpiece should seem worthy to be the work of any master. But as there is no art in which excellence more demands of the master that he shall mortify the egotistical sentiment, so there is none in which the temptation is greater or the way more easy to mannerism. To understand how this is, consider that within certain elastic limits there are settled proportions for all the parts of a regular elevation. A column, with its base and entablature, comprises from forty to sixty members, all having definite relative ratios of dimension and projection. A window, a niche, a doorway, all have well-defined lengths, breadths, and proportionably associated members. So of the projection of cornices, pilasters, friezes—in short, of all the parts that together make up the structure. To combine these into new masses of structural and utilitarian propriety is the work of original genius. To achieve singularity in detail is the easy resource of mediocrity and vanity. It needs only to exaggerate particular parts, upward, downward, laterally, or in projection. It requires no quality but insensibility to recognised proportions and audacity in departing from them. But the true artist will not condescend to these departures. He knows that in regular art every detail has already been elaborated into the most refined symmetry of which it is susceptible. If he cannot achieve new combinations of masses, he will be content to reproduce existing models, and rather bear the name of a copyist than purchase the reputation of having a style of his own by singularities of detail.

### *St. James's Church, Piccadilly.*

JAMES ELMES.

It may be said of this church, and many of this great architect's works, whoever wishes to acquire a knowledge of architectural construction, which is at the same time scientific, durable, beautiful, and economical, must give his days and nights to the study of the executed works of Wren. Concerning the placing the pulpit, Wren conceived that a moderate voice might be heard 50 feet distant in front of the preacher, 30 feet on each side, and 20 feet behind him; and not so far unless the pronunciation be distinct and equal, without losing the voice at the last word of the sentence, which is commonly emphatical, and if obscured spoils the whole sense. A Frenchman is heard further than an English preacher, because he raises his voice and sinks not his last words. He mentions this subject as being an insufferable fault in the pronunciation of some otherwise excellent preachers, which schoolmasters might correct in the young, as a vicious pronunciation, and not as the Roman orators spoke; for the principal verb is in Latin usually the last word, and if that be lost, what becomes of the sentence? An eminent prelate and many distinguished preachers of our reformed Church have assured me that they have found Wren's three largest and perhaps best churches, those of St. James, Westminster; St. Andrew, Holborn; and St. Bride, Fleet Street, to be incomparably the easiest churches they ever preached in, and wherein they found, by the demeanour of their congregation, they made themselves the best heard and understood.

### *Style in Sculpture.*

DR. WAAGEN.

When we say of a work of sculpture that it possesses "style," the following qualities ought to be implied. The sculptor must have so treated the solid material, such as stone, metal, wood, with which he has to deal, as not to remind the spectator of the nature of the substance employed, but so as rather to suggest to the eye the character of the object imitated—flesh, drapery, or whatever it may be. Further, as we learn from antique sculpture, in the treatment of naked surfaces the muscles should not be represented by prominences so isolated and abrupt as to impair the general breadth, but it should be rather indicated by moderate depressions in broad surfaces.

In drapery, again, to attain the same general breadth of effect in the larger surfaces, which are supposed to be defined by the forms and action of the body, the details of the folds should be represented not by big heavy projections, but by numerous contiguous channellings or markings. The sculptor must, moreover, take care not to attempt in every part of his work as perfect an imitation as the nature of the solid material he employs would admit; but he should adopt a treatment more and more conventional in proportion as the object he has to represent is less and less important, flesh being the most important, for otherwise the degree of illusion sought for in the imitation of flesh cannot be attained, because the imitation of many subordinate objects can be carried much further in the solid material with which the artist has to work. In sculpture "in the round" it is also necessary that the centre of gravity be so observed as to suggest to the spectator the idea of solidity and security. In reliefs, lastly, this rule is to be followed—that whether the work be in high, middle, or low relief, no single portion should project beyond the extreme limit of general relief in each case intended, but the whole profile of the relief should be restricted within a given scale, that again there should not be more than two distances in the composition, so that two figures at the most can stand one behind the other. To attempt greater depth is to invade the province of picturesque composition, and by destroying the idea of relief from an actual plane, to cause indistinctness of outline.

#### Variety of Tints in Nature.

H. F. GOBLET.

It is said by Goethe, in his "Winckelmann und sein Jahrhundert," that the mosaic-workers in Italy, whose business it is to compound in particles of coloured stone placed on a flat surface correct imitations of the works of both nature and art, are accustomed to employ a number of tints nearly one thousand times greater than the 819 tints which has been given on the authority of Meyer. They are said to be in the habitual use of fifteen thousand varieties of hues, each variety comprising fifty tints, and this is a gross sum of seven hundred and fifty thousand changes of colour. It is of little consequence whether or not these tints are all wanted on one occasion, or for one piece of workmanship; the existence of an ability to recognise the differences is all that needs be contended for. Perhaps mosaic-working is not a bad mode of testing the amount of tints that can obtain—at least it may be depended on to a certain extent. The hues of nature in nearly every case graduate by insensible degrees, and the attempt to imitate these hues by particles of coloured stone is an artificial mode of superinducing disjunction or stage, on insensible gradation. By the admission of separation among the tints, we are led to the knowledge of how many are required to imitate any particular effect, and how many are called for in the general representation of nature. Its defect, however, is the following: that while in nature the portion of tint which each stone represents gradates on each side into its neighbour's, in mosaic imitations this tint does not graduate, but is throughout of the same strength, whence, by the practice of mosaic working, we shall not obtain the number of tints really existing in nature till we can find and employ portions of coloured stone no greater in extent than a particle of gradating colour. This we cannot do. Mosaic working, therefore, only gives us a minimum. We have, of necessity, less tints than actually obtain in nature.

#### Competition in Sculpture.

H. WEEKES, R.A.

To competition, in its true sense or meaning, no artist can object, unless, indeed, he is conscious that his efforts will not bear comparison with his contemporaries, and that he is holding a position with the public which his talents do not warrant; in theory it is excellent, but, alas! in practice utterly abortive. Were the English public enlightened on the subject of art, it is just possible that competition might effect good purposes, and that a jury might occasionally be brought together capable of judging correctly on matters of taste; but before this can take place a great change must be undergone. Englishmen must become intimate with the theory and principles of art; its real rudiments must be made an item in education, and take their place with other things taught in our schools; then, and then only, can we expect a generation to spring up capable of perceiving and appreciating the distinction between good and bad. As it now is, the submitting of artists' works to the decision of juries who have not made art their study is worse even than the previous system of monopoly; not that every member of the committees which chance throws together for the consideration of questions connected with art is unqualified for that purpose. It would be strange indeed if, among the number, some were not found of sufficient perception to enable them to come to correct decisions, but the experience of these very men teaches them that they have to contend with the ignorance or indifference of their fellow-jurors, and that their own knowledge and wish to promote talent is insufficient to withstand it. Where, too, a

large majority of jurors are either ignorant or indifferent on the question of comparative excellence, it is easy for the influence of private friendship or personal partiality to creep in, as it is but too apt to do. That this has been the character of nearly all English juries of taste no artist will in his own mind deny, though those who have profited by the system may not care openly to avow it. The result is but too evident: works have been, in nine cases out of ten, entrusted to this one or that one, not in consequence of the superiority of his talent, but owing to indirect or personal interest.

Philibert Delorme.

PROFESSOR HENRY MORLEY.

In the works of Ronsard there is an anecdote concerning Philibert Delorme which illustrates the character of the great architect, and the temper of authority and command which ill became a man of genius, and before which the spirit of Master Bernard of the Tuileries was certainly not likely to submit. Ronsard one day was about to pass into the Tuileries in the suite of the queen-mother, when Delorme caused the door to be shut in his face. The Sieur de Sarlan caused it to be immediately opened to him, and Ronsard, entering, took up a piece of chalk, and wrote in capitals upon the door, before the face of the church pluralist and architect, "FORT REVERENT HABE." Habe, equivalent to Have, was a term of reproach, meaning a meagre person, "a wrinkled or scraggy old woman," as the dictionary has it, and the term probably applied with some force to the person of the architect, while the "Very Reverend" might be applied sarcastically to his clerical revenues, or to his overbearing claim on reverence. It will have been observed that Palissy speaks of the architect always as "commanding." Delorme, offended by Ronsard's inscription, brought his complaint before the queen; but the offender, being summoned to answer for himself, informed Her Majesty that what he had written was not a scurrilous insult, but a delicate reproof. "Fort Reverent Habe" are not French words, madame, but the commencement of a verse out of Ausonius: *Fortunam reverenter habe*—Be modest in prosperity—words profitable to be read by all men to whom fortune has been kind."

#### A Greek Mosaic.

EDWARD DODWELL, F.S.A.

A Greek having observed us taking sketches at Salona, said that if we would follow him he would show us a Hellenic picture. He accordingly conducted us to a cellar in the town and having removed some barrels and lumber, discovered a large mosaic pavement, coarsely worked, representing various animals, as dogs, horses, and tigers. Pliny says the Greeks were the inventors of mosaic pavements; but there is now very little remaining of it in Greece. Indeed this is the only entire specimen I have seen. There is one at Orchomenos, in Boeotia; but it was covered with water when I was at that place, and was not visible. There are also some small remains of mosaic pavements at Athens and at Delos.

#### English Wall Painting.

J. G. WALLER.

The methods employed by our mediæval artists were of simplest character, particularly in the wall paintings of our churches. The latter were executed in "tempera," an Italian term represented by the English "distemper." It means no more than that which mixes or tempers the colours, and might be applied to any vehicle whatever. But as generally understood, in former times as now, it is applied to that vehicle made of parchment size, or the superior egg medium, *i.e.*, eggs beat up with the juice of shoots of the fig-tree, but vinegar can also be used with the same effect. We have proof that both species of tempera were known and practised in England; but the former must always have been that used on walls, and it is this that we see in our mediæval churches. Both are of the greatest antiquity, known to Greeks and Romans, and also to the ancient Egyptians. Under reasonable conditions it is very durable, as, indeed, is shown by works executed in this manner, enduring for many centuries the humidity of our climate and all kinds of neglect. As regards the superior egg medium, it was chiefly employed in painting upon wood or panel, and when in our records we see the term "tabula," it either refers to a movable picture, as above an altar, or to those executed in panels on a screen. The practice in Italy did not differ in this respect. The use of the term "tempera," as restricted to the above processes, was gradual, as even Vasari occasionally applies it even to oil as "tempering" colours. But when the term "fresco" was in familiar use for painting on the *fresco* or wet plaster, and oil vehicles became general, it naturally was convenient to keep the word "tempera" to the process when it was first applied. Our archæologists, though often corrected, still frequently call our mediæval wall paintings "frescoes." It is obviously most improper, as even the "fresco buono" of the Italians was not completely developed until the fourteenth century, though the system was known to the Greeks and Romans.

## NOTES AND COMMENTS.

HER MAJESTY has placed at the disposal of the Executive Council of the Inventions Exhibition the fine collection of historic musical instruments of which a portion was exhibited in 1872, and other objects relating to music which may be available. The group will resemble in its main features the loan collection which was held at South Kensington in 1872, and will comprise historic musical instruments, manuscripts, paintings, engravings, and appliances of all kinds relative to music.

AN interesting course of Cantor Lectures on "Carving and Furniture" will be commenced next week at the Society of Arts, by Mr. J. HUNGERFORD POLLEN, late of the South Kensington Museum, and the author of the large catalogue and the handbook on the furniture and woodwork collections of the Museum. The course will consist of four lectures, to be given on March 9, 16, 23, and 30. Lecture I. will deal with the types and fashions of the wood carver's art; lecture II. will be devoted to the Renaissance; while the subject of lectures III. and IV. will be the Age of Gibbons, Boule, and that of their successors.

THE French Society of Architects are about to form a committee for the purpose of taking cognizance of everything connected with public competitions in France. The members are to study all announcements, and to transmit those which are likely to have interest for the society to the central council, and, whenever necessary, the subjects are to be brought under the consideration of the contemplated association for the defence of French architects. The committee will also give information and advice to municipal and other institutors of competitions; and it is considered that, from the position of the French Society of Architects, much aid can in this way be rendered to public bodies, for the question of competition is said to be one of general interest and national honour. As there is a mutual respect between organisations in France, the society is likely to be much more influential in controlling competitions than the Institute committee has been in this country.

DR. POLE has been associated as secretary with all the late Royal Commissions on Water Supply, and he is therefore in a position to speak with authority on the subject. In his late lecture at the Institution of Civil Engineers, it was explained that the quantity of water that is requisite for domestic use is not more than about 10 or 12 gallons per head per diem, but to provide for other purposes about 25 gallons per head is usually allowed. It has been ascertained that in towns the consumption of water is not uniform. It is greater in summer than in winter, and it is much greater at some hours in the day than at others. Assuming the average rate of supply over the whole year to be 100 gallons, the actual rate at some periods will rise as high as 235 gallons, and it was recommended that in determining the sizes of supply mains the latter figure should be taken. A constant supply has been opposed on the ground of wilful or careless waste, but it appears that there need be little fear of waste. Dr. POLE in the course of his lecture mentioned an interesting historical fact, namely, that it was to the special cultivation of the hydraulic branch of engineering that civil engineers owed their origin as a separate and well-defined body of practitioners distinct from military engineers.

It is anticipated that the great church which crowns the hill of Montmartre will be completed in 1889, the year of the proposed international exhibition in Paris. But that is contingent on the amount of subscriptions reaching the exchequer. Since 1875 the offerings have amounted to 15,183,824 frs., and at least twelve millions more are needed. Yet, in spite of the cost the building is remarkable for its severity, and it might be said of the part completed that it is destitute of ornament. The construction is carried on with much difficulty owing to the want of funds, as a contract for no more than a small portion can be undertaken at a time. It is also to be feared that extra cost will hereafter arise owing to the rain, which percolates through the exposed works. An energetic endeavour should be made to have a larger portion covered-in without delay.

GLASGOW is so entirely a stone-built city, it is difficult to realise that houses could have existed there of any other material. But according to a lecture delivered by Dr. F. W. CLARK, on Tuesday, the city has been rather backward in its civilisation, and the inhabitants were no better housed at the end of the fifteenth century than were the dwellers in a Highland or Irish village at the close of the last century. Gradually, stone having superseded wood, houses of more than one storey became common, though they never attained the altitude of the houses in Edinburgh. The reason given for the difference is that Glasgow was never a walled city, and that therefore it was not necessary to economise space.

THE French Government have resolved that the national factories shall be worthily represented in the approaching Antwerp Exhibition. There will be a special chamber of about three hundred mètres square, which will be appropriated to the pottery of Sèvres, the tapestry of Beauvais and Gobelins, and works in mosaic. One of the grandest pieces among the tapestry will be the *Apotheosis of Homer*. It has been announced that there will be 286 Austrian exhibitors, forming six groups, and their goods will occupy 2,800 mètres. The decoration of the section will be undertaken by able artists, and nothing will be left undone to make Austria and Hungary one of the most attractive of the divisions. The King of the BELGIANS has proposed that the exhibition should be utilised as an opportunity to form an international congress on commercial law, and has nominated a commission to make the preliminary arrangements.

A PNEUMATIC tube is likely to be laid down for the conveyance of letters between the post-offices of Paris and Brussels. It has been calculated that letters can be transmitted between the two cities in about half an hour. But a much more remarkable project is one by M. BERBER, who proposes to establish two tubes between Paris and London, by means of which a letter or a post-card could be carried from one city to the other in an hour. The cost is estimated at about forty millions of francs.

THE following are the principles which MR. HAITE suggested should regulate the decoration of ceilings in a paper which was read at the Building Exhibition:—1st, That the ceiling being a flat surface, we should not seek to give it any other apparent form, therefore all perspective, fore-shortening, or representation of light and shade should be excluded; 2nd, that the result of any decoration depends more upon the colour than on the form of ornament, and that colour should take the place of ornament; 3rd, that the ceiling having no other structural purpose but a covering, allows for a freer and wider range of fancy in the decoration; 4th, the use of figure, or any pictorial representation whatever, is not applicable; 5th, that any scheme of decoration, either of diaper or border treatment, should invariably spring from the centre; 6th, that the breaking up into panels, by mouldings or painted divisions allows of more varied treatment in colour; and 7th, that the most satisfactory decoration of the ceiling-flat as one panel by other than handwork was the diaper, terminating in a border with corners.

ACCORDING to the official statistics, the earthquakes in the province of Granada have caused, since Christmas, the destruction of 3,342 houses, and 2,138 have been more or less injured. The deaths have numbered 690, and 1,173 people have sustained wounds. As slight movements are occasionally felt, it is not surprising that there is a general state of consternation in Granada.

BELGIAN connoisseurs are as fallible as their brethren elsewhere. A portrait was lately purchased for the museum at Antwerp which was supposed to have been painted by VANDYCK. Doubts having arisen about its worth, a commission was appointed consisting of MM. DE TACVE, LAMPE, and GEETS to inquire into the matter. The three experts have unanimously decided that the portrait is not a work of VANDYCK, and that it is a very worthless imitation of the master. It is not stated whether the purchase money will be returned to the Government.

I.—THE GRACES. II.—A SEVRES BOWL.

THE present art director of the Sèvres factory is M. CARRIER-BELLEUSE, under whom the pottery has upheld its reputation for beauty. As a sculptor of high standing, the director has been able to impart a better style of modelling to the general work, and to show that elegance can mean something more than prettiness. The author of the works reproduced in the plates is one of the director's sons, and has had the rare fortune of carrying off the principal prize offered by the French Government in two successive years; indeed, the feat is without a parallel in the annals of Sèvres. The illustrations will suggest the kind of work which is now adopted in the factory, and the influence of M. CARRIER-BELLEUSE the elder can be traced in the figures, which are worthy of CANOVA.

BAGNALL HALL.

WARD, in his old history of the borough of Stoke-on-Trent, says Bagnall (formerly Bagenhall) is a hamlet outlying north of Eaves, and in a different hundred (Totmonslow). It is an elevated moorland tract, but now wholly enclosed and cultivated, or planted, containing 1,650 acres, including some extensive woodlands. The small village of Bagnall is seated near the centre of the township, where a neat modern chapel of stone, with a tower, was erected in 1834, in place of an old one, which had a belfry of wood; it is distant from the mother-church of Stoke (of which it was doubtless one of the elder daughters) some four miles.

In the reign of Stephen, or Henry II., Bagnall was held by Ivo de Pantune, who granted it to Adam de Audley, by whose descendants it was incorporated with their manor of Horton. It was also in remote times the seat of a family who took their name from the place. In after ages it was occupied by a family of the name of Murhall, who were probably seated there as early as the reign of Henry III., for William Murell then held a virgate of land in Shelton, in fee-farm, as park-keeper of Castle Cliff. William Murhall, Esq., a magistrate of the county, who lived there in the year 1745, is the subject of traditional fame for the summary and savage justice he inflicted upon one of the Young Pretender's Scotch stragglers. The principal house of the village is a good old mansion of stone, the ancient seat of the Murhalls; and at a short distance is Greenwood Hall, formerly belonging to Judge Bradshaw, president of the High Court of Justice by the sentence of which the unhappy Charles Stuart was carried to the scaffold.

Strange legends survive on the country side of the old days when Bagnall was a bleak, desolate moor, relieved by one or two semi-fortified farmhouses, or a wayside inn more famous for murder than for good cheer, and infested by cut-throats and highwaymen, coiners, and other citizens of "Alsatia." Mr. JOHN SLEIGH's excellent "History of Leek" furnishes some curious particulars. With regard to the particular incident alluded to by old WARD, tradition hath it variously that it was to avenge a stain on his family honour and a theft of arms from his "mansion" that led Squire MURHALL to hang upon a sign-post near Leek the rebel whom he captured, and afterwards to "flay him like a calf and send his skin to the tanyard to be made into leather for a drumhead." The good Christian perpetrator of the reprisal sleeps in the neighbouring churchyard of Endon, under the epitaph, "Part of what I possessed is left to others, and what I gave away remains with me."

The ancient inscriptions ("I. M. 1603," and "I. M. rebuilt 1777") on the old or north front of Bagnall Hall are relics of the MURHALLS' occupation. The existing south front has no features of interest. Mr. KEATS, the present owner, is adding to it two bays in the old part, and is extending the hall proper to receive another similar bay, as indicated in our illustration. The further annexe on the east side, with the central tower, is being built upon the foundations of an old farm building, which was recently taken down owing to its dilapidated condition.

The works are being carried out under the direction of Messrs. W. SUGDEN & SON, architects, of Leek. Mr. JAMES HEATH, of Endon, is the builder.

ST. BARNABAS CHURCH, BLACKBURN.

THE plan of the church consists of nave, side aisles, chancel, transepts, organ chamber, choir and clergy vestries, with a large parish-room under the chancel. The number of sittings, which are all free, is 722. The stone is being procured from the Yorkshire quarries. Wood blocks are to be laid in the aisles and chancel. The contract has been let for the sum of 6,098*l.* to Messrs. MARSHALL & DENT, of Blackburn, and Messrs. MERCER BROS., also of Blackburn, have been entrusted with the contract for hot-water apparatus. The work is being rapidly pushed on under the superintendence of the architect, Mr. WILLIAM S. VARLEY, F.R.I.B.A.

RENAISSANCE CEILINGS.

THE illustrations are specimens of those which are to appear in the volume called "Art and Work," by Mr. OWEN W. DAVIS. It will be seen that every inch of space is occupied, and all the plates are no less full. The ceilings shown have been designed by SEBASTIAN SERLIO, or SERLY, born at Bologna 1475. He was one of the artists that FRANCIS I. invited to Paris to establish the new-born Classic art in France. The designs are taken from his "Books of Architecture," Venice, 1551-84.

OLD WROUGHT-IRON GATE, SCRAPTOFT HALL.

THIS gate forms the entrance to Scraftoft Hall, a building of the eighteenth century, now the seat of Captain BARCLAY, and which stands at about five miles from Leicester. The small hand-gate, published in our issue of February 7, is at the side entrance to grounds of the above hall. The original measured drawing was by Mr. ARTHUR H. HIND.

## SOMERHILL, KENT.\*

SOMERHILL (formerly written Summer Hill) was built by Richard de Burgh, Earl of Clanricarde and Baron Somerhill (died 1636), on the site of a house which had belonged to Sir Philip Sidney. It appears to have been in course of erection from 1609. The original lead stack-pipe heads bear the date thus—<sup>1611</sup><sub>C</sub>. Cromwell bestowed the house upon

President Bradshawe, and afterwards it passed to Lady Muskerri, celebrated by Count Grammont as the "Babylonian Princess." The walling is of native stone; the chimney-stacks alone are of red brick, and the roofs are covered with tiles. It is a very perfect specimen of the Jacobean style, has a plain exterior, mainly relying for effect upon good proportion; but within the house there is a greater amount of detail, and some elaborate carved oak work, notably upon the justice-room chimney-piece. The mouldings of the wood panelling are characteristic of the date, and exceedingly effective.

The house is approached from the west side, not shown in the view. The entrance being in the centre of the main house, a porch leads at once into the hall, which runs through the whole depth of the house, and its east windows are seen under the third gable from the left in the view. Above the hall is the saloon, now used as a drawing-room, 48 feet by 24 feet, which runs up through two storeys, and divides the main house completely in two. On the south of the hall are the drawing-rooms, and above these the principal bedrooms. On the north of the hall are the dining-room, the private rooms, and the principal servants' rooms, the kitchen and offices being in the basement, which extends under the north portion only of the main house. North of the main house is the quadrangle of low buildings shown in the centre of the view. Here are the numerous offices of a large house, the brewery, bakehouse, servants' sitting-room, larder, stores, &c. In the centre is an open basin of spring water, on the north side the stable and appendages; on the south and east of the house are arranged the formal gardens, enclosed by terrace walls.

The library, a large apartment upon the south side of the main house, was reconstructed out of other rooms from designs by Sir Jeffry Wyatville. This room is about 70 feet in length. Some alterations have also been made by Mr. P. C. Hardwick, but without affecting the exterior, which has remained nearly untouched, until in 1878 Sir Julian Goldsmid consulted Mr. Thomas Henry Watson, architect, respecting the additions he required to the house. These were carried out from 1879 to 1881.

Certain alterations were made in the main house; many of

\* See Illustration in *The Architect*, February 28,

the offices were converted to other uses, and a suite of apartments formed for the young ladies in the south wing. Dressing and bath-rooms were formed to complete the own rooms suite. Bachelors' rooms on the east, and additional servants' rooms on the north and west sides of the quadrangle, but all this without disturbing the original appearance of the building.

The new works consist on the west side of "The New Court," containing stores and sheds for wood, coals, coke, &c., rooms for the second coachman, and mess-room for the stablemen, clock-tower, &c. None of these appear in the view. The "North Court," a stable-yard, carriage-houses for twenty carriages, stables for twenty horses (the old stables for ten horses set in order), washing boxes, washing place for carriages, and harness-room. These occupy the ground-floor of the J-shaped additions, which form the right-hand part of the view. Above the carriage-houses are suites of visitors' rooms; above these, rooms for valets and maids, with separate stairs. A carved oak stair leads from the bedroom floor to a hall or lounging-room with a large bay-window, and from this level down to the gardens, where a small doorway gives exit to a terrace formed for tennis-courts, both turfed and asphalted, on the north side of the block. The natural slope of the ground admitted of the formation of a billiard-room, 44 feet by 22 feet, under the north carriage-house, and smoking-room, &c., at the same level. These extend to the second gable on the right of the view. Beyond, at the level of the oriel, are the stables, over them the head coachman's rooms, and rooms for eight stablemen, bath-room, &c. Above are the lofts. Under the stables, approached from the garden side, are rooms for gardeners and stores for implements. The east side of the new wing is 77 feet, the north return is 160 feet in length.

### THE BLENHEIM PALACE PICTURES.

DURING the past year memorials had been sent by the Royal Academicians and other painters to the Prime Minister advocating the purchase of the collection belonging to the Duke of Marlborough, or a part of it, and in consequence the "Ansidei" Raphael and the portrait of *Charles I.* are now the property of the nation. The following is the memorial of the Royal Academy:—

The rumour that a large number of the pictures, which have hitherto been the honour of Blenheim Palace, are about to be offered for sale, pictures amongst which are counted works unique in their excellence and beauty, has strongly moved the artistic community in this country. To this emotion we, the members of the Royal Academy, having in trust the interests of art in England, feel it our duty to give emphatic and earnest expression. We are acquainted, indeed, sir, with your own enlightened love for all that is beautiful in art, and have no doubt that you share our deep desire that such inestimable possessions be not lost to us, and that we be spared the humiliation of seeing them pass into those foreign hands which are, as we too well know, eager to receive them. But we are moved also that, in these days of keen and ever-growing competition, considerable pecuniary sacrifices will be needed to obtain this result, and we should not be faithful to our trust did we not bring to bear the whole weight of the opinion of this representative body to the strengthening of the hands of Her Majesty's Government in an emergency of such gravity. It is not needful to insist on the importance and variety of the works which are about to be offered for sale. You, sir, are well acquainted with them. Nevertheless, three or four of them may be here alluded to, not only because of their surpassing merit, but as corresponding to definite and most regrettable wants in our national collection.

In the first rank is the large *Holy Family*, by Raphael, a work produced in that happy period in which the reverent purity and the serene grace of the master's earliest work are already mellowing into the fuller dignity of his middle style.

Hardly less important is the equestrian portrait of *Charles I.*, by Van Dyck. This picture of an English king painted by an artist whose name is so intimately connected with the English people, and from whose hand our gallery does not boast a single full length portrait, will not, we feel assured, be suffered to leave this country.

From the hand of Rubens, again, we possess no portrait of full dimensions; in those of the artist and his family are two of Helena Forman, his second wife: magnificent samples of his art are here brought within our reach, by the side of examples not less striking of his powers of invention and the magic of his brush.

The companion memorial was as follows:—The announcement that a celebrated historic collection is about to be dispersed has awakened feelings of deep and widespread concern. The pictures presented to the Duke of Marlborough by foreign States, in token of their admiration and gratitude for his services, and which have served to adorn his palace at Blenheim, have almost come to be regarded as national heir-

looms. They have been associated in the minds of succeeding generations of Englishmen with some of the most brilliant pages of their country's record. Even more important than the associations connected with them is the intrinsic artistic excellence of many of these pictures. They stand as landmarks in the history of art. Students of painting from foreign countries, and those who find delight in contemplating the masterpieces of the renowned Italian and Flemish schools, have always eagerly sought admission to the gallery at Blenheim. Hence the excitement created on the continent by the rumour of its approaching sale. The directors of every continental museum are on the alert, and all hope that some of the treasures of the Marlborough collection will be added to their own walls.

It is this pressing danger that has moved the undersigned to implore you, sir, to furnish the means whereby the principal works of this collection may be secured to the nation, to add to the glory of our National Gallery, and serve as examples for study to our artists. A stigma would be attached to this generation, if, having these works in our possession, they are now allowed to leave our shores. But, knowing the deep interest you have always manifested in the advancement of the arts of design, and in the elevation of the national taste—so vital to the growth of the national industries—we confidently hope that by your instrumentality an event so disastrous as the loss to the country of the Blenheim masterpieces will be averted.

### A CHALDEAN TEMPLE.

IN the first of his new series of lectures on Assyrian and Babylonian antiquities, at the British Museum, Mr. W. St. Chad Boscawen treated of the "Chaldean Temple: its Construction, Symbolism, and Services." In commencing his lecture, Mr. Boscawen said that it was very important to understand the high position which the temple occupied in Oriental history. It was not only the germ of the ancient city, but its walls and treasure chambers reflected its history. If we glanced at the plans of some of the most famous temples of the East, we could see in their ruins a by no means meagre history of the people worshipping there. This had been shown by the great Egyptologist, M. Mariette, who in his plan of the temple of Kamak had coloured differently the work of each dynasty, and it could be seen at a glance how at periods of wealth and power great and lavish works were carried out, and how in periods of decay and weakness even the work of necessary repair was left undone. It was the same with the Jewish and the Chaldean temples; they reflected in their history the history of the Jewish people. The discoveries made during the last few years in Chaldea had resulted in the recovery of much important information regarding the temples of that land, and the explorations carried out by Mr. Hormuzd Rassam had been specially prolific. The discovery of the site of the ancient city of Sepharvaim had not only resulted in the discovery and exploration of what we may certainly regard as one of the oldest, if not the oldest, temple in Chaldea, and in the recovery of inscriptions which revealed to us the nature of the services there; but, in addition, it was important to note that it was from this city that the Samaritan colonists came who so rapidly became affiliated to Judaism. The construction of the temples explored by Sir Henry Layard at Nimroud and by Mr. Rassam at Ballawat and Aboo Hubba was then explained. The general arrangement was an outer hall or Naos, called by Jews and Chaldeans alike Hekal, or "the palace," and an inner and more holy chamber called Parakkee, or "the most holy place." The word "parakkee" had passed through various phases. First, it was the altar, the local holy place, then the holy place of the temple, and, lastly, the harem of the palace, as the most secluded portion of the royal residence. By means of a recently discovered inscription, we learned that the Chaldean Temple was built with the most holy place at the east end. Many of the ceremonies were common alike to the Jews and the Chaldeans. Mr. Boscawen described the symbolism employed in the decoration of the temple and of the idols. This portion of the lecture was illustrated by the exhibition of a number of enlarged drawings representing the sun god and solar hero Gisdhubar, also the gods of fire and pestilence. The former was represented a long-haired, with luxuriant beard representing his rays, and figured as a giant strangling a lion—illustrative of one of the chief episodes in the poem of the "Labours of Gisdhubar." The figure of the fire-god brought this duty in close connection with the solar hero, like whom he had luxuriant hair. But more important still, in a statue now in the Louvre, this deity is represented as holding a long conical staff, which, the lecturer pointed out, was clearly the fire-stick, and indicated the existence among the Babylonians of a myth similar to that of Prometheus among the Aryans. The god of pestilence was represented as lion-headed, in agreement with the epithet of the Great Devourer applied to him. Mr. Boscawen then proceeded to speak of the

robes worn by the priests, such as the ephod, girdle, breastplate, &c. He then gave an account of the various duties and uses which the temple and its servants were employed in. The priests were the scribes and the teachers of the people, and Mr. Rassam's explorations in the Birs Nimroud showed that there had existed there a great library containing earlier and later editions than the Assyrian we now possess of such important works as the Deluge Tablet and the Creation stories.

## Bygones.

"Antiquity after a time has the grace of novelty."—HAZLITT.

### ACADEMY "GHOSTS."

WE promised last week to give the statement by which the unfortunate Mr. Reinagle hoped to support his cause against the Royal Academy, from which he had been justly expelled. The following is the document, which has a special interest for our readers from the reference to Professor Cockerell:—

The Royal Academy is without a charter, and it is only under a charter that laws of any society can be recognised and enforced by the authority of our Constitution. The instrument of institution, or deed, of the Academy, requires that every Academician shall uphold the institution to his utmost. They are all desired to maintain, by their works, the annual exhibitions. A member independent of the arts, who was elected the year before I became an Academician, has exhibited but once for the last twenty or twenty-one years. Is this upholding? Nevertheless, he is allowed to retain his place amongst the forty, to the exclusion of a more worthy successor.

Our Royal Academy architects set no example for rising young men. It is a rare event to see a design by an architect who has R.A. appended to his name; and then the work is most commonly done for him by a skilful youth, a water-colour artist fills in the shadows and paints a sky and background. This, then, is an accommodating way in which Academicians are allowed to impose other men's works for their own, which is winked at by their body.

Sir T. Lawrence, while President of the Academy, committed a great number of such impositions (if I may so call these substitutions) upon his employers. I have seen many whole-length portraits exhibited as his own works which had been painted by his helper, Mr. Munday, whom I recommended to him as a person of great abilities, the head alone being by Lawrence.

Ramsay received an order from King George III. to paint ninety pairs of his whole-length portraits of the King and Queen. My father was his apprentice; and, at the expiration of his pupilage, Ramsay contracted with my father to paint them for fifty guineas the pair. For these pictures, which passed as his own work, Ramsay received from Government 200 guineas the pair, although he remained in Rome, studying Latin and Greek inscriptions, all the while when he was supposed to be painting the portraits. *En passant*, I may say that I wrote the life of Ramsay in Cunningham's "Lives of the Painters," which he promised to state to the public, but this he always omitted to do, and received any merit which accrued from it as his own.

Sir Wm. Beechey was commanded to paint a small copy for Her Majesty Queen Charlotte of his large picture *George III. and the Prince of Wales Reviewing the Troops in Hyde Park*—the picture now in Hampton Court Palace. I did the copy, which was about 18 inches long for him in his studio or show-room in George Street, Hanover Square. Beechey showed me no sort of hospitality. His man-servant very commonly came in and told him dinner was ready. No refreshment was ever once tendered to me. When I had finished the copy, we came to payment. He was thunderstruck when I told him 80 guineas was what he had to pay me. He said he expected I would have done it for 20*l.* as we were brother artists. I reminded him that I had been treated contemptuously, as unfit to sit at his table; for during the whole six weeks it occupied me not even a bit of bread had been offered, though I worked from 10 a.m. till 7 p.m., it being summer time. The Queen paid 120 guineas for the copy, believing it to have been painted by Sir William, and I know he received great encomiums for it.

My next contact with an R.A. was with Mr. Chantrey, afterwards knighted. Being a Derbyshire man, and ambitious of a fame for versatility, he engaged to make a set of drawings for a topographical work on Derbyshire. His sketches were shown to me by him at our interview at Mr. Wm. Cook's, the engraver, then living in Pentonville. They were nearly unintelligible scratches: words stood in most cases for drawn objects, as

trees, a tree, a wall, a road, a path, figures, ducks, running water, a woman, children, stones, rough stone wall, and so on. I agreed to make proper drawings from them, at the charge of 6 guineas each. When the first six were engraved by W. Cook, and I was invited to meet Chantrey at his (Cook's) house, to my astonishment Chantrey's name was engraved at the foot as the artist, and not mine. I expostulated in vain. He had the ambition of being supposed to be a good landscape draughtsman. He wished me to continue the work, but I refused to do another unless my name as the actual artist, and not his, was engraved. This caused a silent coldness for ten years, when he, of his own accord, took me by the hand, and hoped I had forgotten all that happened many years ago. I said I could forgive. We were very friendly during the rest of his life.

Sir Francis Chantrey exhibited, among other works of sculpture some years ago, the group of two children asleep in each other's arms, lying on a mattress, now in Lichfield Cathedral. The Italian artist died some few years since who told me, as he had told numbers of other persons, that the composition, the model, and the work in marble, were all three his doing. The manner in which Sir F. Chantrey behaved to him, his want of liberality in not confessing whence he had the design, and the daring to call the work his own, affected this poor helping sculptor deeply. He said the powerful reputation Chantrey had in the world caused his tale of truth to be totally disbelieved. Would the Academy have dared to impugn this Royal Academician?

Hoppner engaged me to copy his half-length portrait of W. Pitt. I did thirteen for him, and, during his absence in the country recreating, I also painted four whole-lengths from his portrait, each in four days, though I had never seen and never did see Mr. Pitt. I was paid 20 guineas for each half-length, for which he got 120 guineas. I had 35 guineas for each whole-length, the price he arbitrarily fixed, and he got 200 guineas. One of these whole-lengths was bought by the Duke of Gloucester; another hangs in Grocers' Hall. All passed as his painting, and were sold by him as his works.

Count Woronzoff, the Russian Minister, had the first half-length copy. Hoppner pledged his word to deliver a copy done by himself. He came to me, and desired that I would not vein the giallo antico column, as he had a particular reason. I wondered why so insignificant a part should not be left to me, but I found this was done that he might be able to say he painted it. Then the Count desired him to sign it, which he did.

The late Mr. Constable, R.A., a pupil of mine, exhibited a landscape in the large room of Somerset House, in which I painted a group of cattle, showing the breath steaming from their mouths; I did them with a palette knife to imitate his manner, and he kindly fathered them.

I think enough of examples have been adduced to show that upon points of honesty the academic conscience has not the reality of being very tender; at the same time, it has often been shown to be of the most accommodating kind whenever members of the exclusive or anti-reform party were concerned; and again and again the laws of the Academy have been disregarded or broken through altogether: instances of combination amongst the forty to carry some purpose unworthy of those who follow so high and enlightened a study as art, and subversive of all that should be the aim and object of the society, are plentiful since its first foundation. As examples may be mentioned the case of R. Strange, the celebrated engraver; the Academy refused to admit him, although they directly after elected Bartolozzi, the *protégé* of Lord Bute and Mr. Dalton, pretending that he was a painter. Barry was a victim to a similar combination, and was actually expelled on account of his persevering attempts at improving the school: he was refused a copy of the charges made against him precisely as I have been. Mr. Cockerell once brought forward a proposition that foreign artists should be elected honorary members; this was negatived by a large majority, but Mr. Cockerell published a pamphlet upon the subject, which created such enmity against him that he also narrowly escaped expulsion. I have always had the honour to belong to the liberal party; and about twelve years ago I again introduced the proposition that line engravers should be admitted to the Royal Academyship; it was lost by a minority of seven out of twenty-four votes. For a length of time it has been evident to me that I was an obnoxious member; and after giving me various hints by hanging my pictures in unfavourable positions, and other insignificant slights, at length the opportunity occurred for getting rid of me.

Messrs. R. W. Winfield & Co. have just placed in the south wall of Queensbury Church a memorial window to the late Mr. W. Foster, of Hornby Castle and Queensbury, the subjects of which are:—*Abraham, at the Command of God, leaving Mesopotamia for the Promised Land, The Offering of Isaac, and Abraham Receiving the Blessing of Melchizedek*. The whole has been executed under the superintendence of, and from the design of, Mr. T. W. Camm.

## GLASGOW INSTITUTE OF ARCHITECTS.

THE annual dinner of the Glasgow Institute was held on February 27 at the St. Enoch's Hotel. Mr. James Sellars presided, with Mr. David Thomson as croupier. Among the members present were:—Messrs. H. K. Bromhead, Wm. McLean, C. Douglas, J. J. Burnet, Wm. Landless, John Thomson, Airdrie, J. Gordon, J. L. Watson, John McLeod, McGibbon, Skirving, R. Turnbull, and M. Stark. The Chairman, in proposing "The Glasgow Institute of Architects," said:—The Institute was incorporated in September 1868, and it is now in the seventeenth year of its existence, a year which in the human life is one of the most interesting. As an Institute, however, we are much more mature than the youth of the same age. Our infant steps were carefully guided, our school days were watched over by wise advisers. The names of such men as the late Alexander Thomson and James Salmon, George Bell, John Baird, and John Burnet will long be remembered as the fathers of the Institute; and, thanks to the efforts of these men and those who came after them, we have long ago entered on a useful career, doing good earnest work in the past, taking part in all matters of public interest connected with our profession, and justifying our claim to a position of influence among similar societies in Glasgow. It has been said that as a profession we are not recognised by the general public in the same way as the learned professions are. It is not that the architect should be or is necessarily less learned than other professional men, but that anybody may assume the name of architect without any special training or education whatever. The doors are too wide; the way into the ranks of the profession is too easy. No university degree is required, and no examination as to fitness is necessary before beginning practice; therefore many persons do begin practice, do assume the name, who are no more fitted to do so by their training or education than they are to be ministers of religion, doctors, or lawyers. These are the quacks of the profession, and they bring discredit on the name of architect. I hope I shall not be understood to mean that there have not been and that there are not men—some of them very distinguished men—who have done some of the best work in the country who were not specially trained for the profession; but these men were born architects, and I think it is safe to say that their work would have been still finer if they had had the educational advantages which, I hope, will be at no distant date available in Glasgow for all who aspire to be architects. A chair of architecture at the university is required, and an examination before beginning practice, in order to secure the status and the proper recognition of architecture as one of the learned professions. Such an examination would not prevent the kind of persons I have been referring to from calling themselves architects; but there would be a standard of efficiency provided, and the public would no more think of employing the unqualified architectural practitioner than they would of employing a legal pettifogger or a medical quack. Something has been done in the direction I am indicating by the Royal Institute of British Architects and by this Institute during the past year. Then I may here refer to the "Alexander Thomson Travelling Studentship," the funds for which will be available in about two years, and which will be under the management of this Institute. Something is also being done for the architectural education of the young men in our profession, and that by the young men themselves. The Glasgow Architectural Association is doing excellent work in this way, and I mention it here in order that I may express the hope that the Institute will see it to be its duty to assist them in their efforts. The means of getting a proper architectural education are no doubt available for those who can afford to avail themselves of them in London and on the Continent, but we want the same facilities nearer home; and, above all, we want the public to have the means of knowing who have got it and who have not. It may be said that the public can judge by their work, but this is true only in a limited sense. Architecture is, unfortunately, one of the things which most people think they know all about, just as a large proportion of the public think they can steer a boat or drive a horse. And not only does the unqualified practitioner find employment, but occasionally the services of any kind of architect are dispensed with altogether. There are acres of land in Glasgow covered with dwelling-houses and rows of terraces in the west end which knew not any architect; but when their insanitary or unsubstantial condition is discovered the profession as a whole suffers, it being assumed that there must have been an architect employed. The importance of the work of the architect ought to place him in the front rank among professional men. The warehouses or the offices or the workshops in which we do our business transactions, and the houses in which we live, are or ought to be the work of his hands, and on his skill or the reverse the comfort and the health of the community largely depends; and it is, therefore, of the first importance that only men who are known to be properly qualified should be allowed to practice in the profession. There is probably no other professional man who has the responsibilities of an architect,

or who is so much at the mercy of other people in the carrying out of his work—that is, the erection of his buildings. It may be said of him as it is of the good man, that his works follow him—good or bad they are a standing credit or the reverse; his mistakes if he makes them—or if they are made in his name it is the same thing—they will not hide; and his reputation may be ruined in a single day by a thoughtless builder or a careless inspector. The mistakes made by our legal friends, if they ever make any, or if their clerks make them, may be serious enough in their consequences, but they are probably not known outside a narrow circle; while the mistakes made by our medical friends, if they ever make any, are probably never known at all, and the more serious they are the less likely they are to be known. The work done by our Institute is not selfish. It is true that we are, in the first place, a society or incorporation instituted for the protection of our professional interests; but our interests are, as we believe, the public interests, and we have always shown our readiness to take part in all movements having for their aim the public good. Much good work has been done during the past year by the Institute, such as helping to revise the rules and regulations for the measurement of mason work; and it is hoped that the rules and regulations for the measurement of all other departments of building works will be subjected to the same revision, and thus put the system of payment for artificers' work on a more equitable and fairer basis than, in the opinion of some of us at least, it can be said to be at present. The present year has, like its immediate predecessors, been anything but a prosperous one for the building trade, and, therefore, for our profession; but I think there are signs of better times in the immediate future. While there has been no general activity in the building trade, there is one very important structure in progress—the new municipal offices—a building which, I have no doubt, will fully maintain the character of Glasgow for fine Classic architecture, and be in all respects worthy of the wealth and importance of this great city. On the whole, I think we may as an Institute congratulate ourselves in being in a healthy and vigorous condition. We include in our membership a large majority of the profession in Glasgow, but there are still a few outside our doors who should be inside; and I trust we shall gain in strength by getting these architects within our fold before another year. A society of this kind is a common ground of union in which we can meet on friendly terms; a means of promoting good feeling; a place to get rid of prejudice—to get unpleasant angles rubbed off; and it is a standard and referee on all questions of professional practice and etiquette; and a protection of professional honour.

The other toasts were—"The Lord Provost, Magistrates, and Town Council," by Mr. Bromhead—Mr. Carrick and Dr. Russell replying; "The University," by the croupier—reply, Professor Veitch; "The Merchants' House," by Mr. James Thomson—reply, the Lord Dean of Guild; "The Trades' House," by Mr. William McLean—reply, the Deacon Convener; "Kindred Professions," "Kindred Societies," and the "Guests."

## SOME NOTES ON CORNISH CHURCHES.

THE churches of Cornwall are usually described as "mean" edifices. The passing visitor thinks that because their roofs are low and their exteriors void of sensational effects, and their types and features little varied throughout the country, therefore the Cornish churches are deficient in architectural interest. But this is far from the case, as anyone who knows them well can testify. Although the local type is everywhere maintained, the repetition is no bar to architectural interest; it only emphasises and strengthens the peculiarities, gives the type opportunity to ripen, and still allows individuality to each respective church.

There are many points of similarity between the churches of Devon and Cornwall; and as Devonshire churches partake of many of the characteristics of Somersetshire churches, we may say that the work of the three counties is allied. If they had to be classified in order of merit they would have to stand thus—Cornwall good, Devon better, Somerset best. Devon echoes Somerset, and Cornwall echoes Devon. Cradle roofs abound in all three counties. In Cornwall there is no other type of roof. In Devonshire the generality of the roofs are of that type. In Somerset there are a great number of that type, and a great variety of other types also. So there is here often the same peculiar continuation of the nave aisles, to the full extent of the chancel; and the aisles have pitched roofs of the same description as the nave, but somewhat smaller.

This treatment accounts for the absence of clerestory windows in Cornish churches. Indeed, I know only of four instances of clerestories in the county—at Callington, at Lostwithiel, at Fowey, and at North Petherwin. Again, in Devon

\* A paper by Mr. John D. Sedding, published in the *Church in the West*.

and Cornwall there is an absence of any structural distinction at the chancel. I know of only one fifteenth-century church with a chancel arch—at Bodmin; but there are evidences of a chancel arch at North Hill, removed for safety's sake. Tavistock Church, though in the county of Devon, is, so far as type is concerned, practically a Cornish church, and this has also a chancel arch, but in all cases the responds to the arches die up near the roofs; the arches themselves are scarcely visible, as they almost merge in the roofs. I have said that the architecture of the three western counties is of the same genus, but it would be wrong to suppose that the work of each county had not its own peculiarities and distinctive characteristics. Anyone familiar with them soon finds these differences, and is able to mark how strongly local types and local tricks of method prevail.

Cornwall is a remote place, and remoteness in the Middle Ages implied inaccessibility. It was not only remote, it was little known and visited, and it is strange to note how few large Mediæval houses of any pretensions exist in the county. One may remark, however, that if there is no quantity of Mediæval domestic use, there is quality in that exquisite old house—Cothele—a very model and type of a quaint and charming English house.

This remoteness and isolation were, of course, favourable to the growth of individuality of character. The church builders had no one to please but themselves, and as neither the coach nor the railway was running then, there was little chance of interference with traditional types. The earlier periods of Mediæval architecture are but sparsely illustrated. The remains of Norman work are not numerous. There are two bays of a Norman arcade at Lelant; there are also portions of Norman arcades at St. Germans, North Petherwin, and St. Breward; and other Norman remains at Manaccan, St. Cleer, Tintagel, Mylor, and Landewednack.

Early English work is rare. St. Anthony's, near Falmouth, is said to be the best example. I have met with several cases, such as St. Levan, Newlyn East, and St. Wendron, where one or more of the transepts of a thirteenth-century church have been left standing, while the rest of the structure was destroyed by builders of a later date.

The Decorated work which remains is of a high character, as at South Hill, Shevocke, St. Ive, near Liskeard, North Hill, St. Thomas's Chapel at Bodmin, St. Columb, St. Austell, and Lostwithiel. The stone employed in work of early date is Polyphant or Catacleuse stone. The prevailing type of the architecture of Cornwall is of various stages of the fifteenth century. One of the most interesting phases of Cornish work is that which was done in the early part of the sixteenth century. This period is represented at the church of St. Mary Magdalene, Launceston, and at St. Mary's, Truro, which are remarkable for their elaborate external panelling—that at the former is done in granite, and that at the latter in Pentewan stone. The tower at Probus, which is, without exception, the finest in Cornwall, is also of this date (1520). Its rival for eminence is Fowey—100 feet high. Probus is 125 feet high, and infinitely more elaborate, and it is interesting to note how closely it resembles a Somersetshire type. In the churches of Perpendicular date granite is, almost without exception, employed for window tracery; and in the latter work, where dignity of effect was considered, and funds and stone were plentiful, the structures were faced with wrought stone entirely, as at Probus Tower, North Hill (south aisle), and the Launceston and Truro churches, which are covered over with sculptured devices. To the sixteenth century is also to be ascribed the noble series of stained glass windows at St. Neot's, which dates from 1528. To the sixteenth century is due also the fine woodwork in the county, as the seats at Altarnun, St. Levan, Morwenstow, and in the Buryan, Sancreed, and other screens. The peculiarity of Cornish woodwork is the profuseness of its surface ornament, the whole ground of the panels being carved all over. There is nothing like it out of the county—anywhere to my knowledge, except the superb screen at Swimbridge, North Devon. Ordinarily, the panels of even the most ornate screens in other counties will have traceried heads, but plain panels. Here the panels are all covered with sculptured devices—sometimes of foliage alone, of great varieties of type, growing mostly out of quaint little pots; or foliage mixed with birds, or beasts, griffins, and all manner of queer imaginative creatures and religious emblems, and here and there figures of men or angels, and not only respectable men and men of high degree and the patrons of the church, but in some cases the village clown, the squire's tame bear, and the "passon's" pig. And many is the caricature of Tom, Dick, or Harry, and many the piece of friendly fun or playful spite that appear in these carvings, which testify to the deft handiwork and keen humour and quaint imaginations of the Cornish craftsman of bygone days. The history of the grotesque in British art ought certainly to be written. I have often tried to analyse for myself the sources of the peculiar delight one gets from an old Cornish church; but as often as I have tried I have given it up. One cannot put that sort of thing into words.

There is, as I have said, very little to admire in the rough exterior of the churches of the county—in their unvaried outlines, or their unpretending features and repeated types; and the unsympathetic stranger, coming upon them with his mind stored with finer memories, would think them mean and rude and deficient in interest. Somehow, they seem more identified with the local surroundings than is the case with the church architecture in other parts of England—possibly because the surroundings are themselves usually of so striking and absorbent a character, and because their builders actually, in many cases, merged the churches into the hill-sides by building them "into the country," as country folk say. But these simple structures seem somehow to be part of the simple nature of the moor and down which surround them; they have what painters call "quality" or tone in them; they are essentially human, and eloquent of the character and every-day life of the men who reared them; and they are full of the silent poetry of art that was human while it was religious, and that dedicated its best to the service of the great God in an unpretending, unaffected way.

#### South Kensington.

SIR,—The varied opinions expressed in your "Tesserae" are not only interesting and valuable in themselves as coming from men of mark, but convey collectively the truth of the difficulty under which they labour. The few remarks of the most terse of all thinkers, Professor Huxley, and the undoubted truths conveyed by those of Walter Smith, nearly cover the whole ground.

Curio hunters, archaeologists, "would-be" bookworms and clerks in legions—the latter in overwhelming proportion—swamp and oust the practical workers under the Science and Art Department. Speaking from over forty years' experience as an art expert, for thirty of which I have held a post in a Government Department, I see nothing to encourage any hope of anything better till this order of things is reversed.

When I state that I myself have drawn and superintended the engravings of nearly all the books referred to by Sir Cunliffe Owen, that it was all done *in spite* of the opposition of the clerkly "powers that be," that I have never spent an hour in any art school, is to record only one of many facts or proofs I could adduce.

Let the cobbler stick to his last, and if he wants culture, scientific or historical, let him read. Give him books; let him keep abreast with the theoretic. We are now threatened with blacking without having boots. Polish is necessary, no doubt; so are boots. One man to make boots, and ten shoeblacks, confuse and upset the proper balance.

I must differ on one point with Walter Smith as to the utter paucity of men worth mentioning. The late R. N. Wornum, the first Art Librarian at South Kensington, was a serious loss by his removal to the National Gallery. He possessed all the proper elements as teacher of ornamental and industrial art.

I will give one more fact, which is no secret. The National Art Library at South Kensington consists of about sixty thousand volumes. Of this number, roughly speaking, about ten thousand are books of topography, and the same number of volumes represent subjects nearly foreign to anything useful to any description of art teaching.

Yours obediently,

South Kensington:

March 5, 1885.

ANDREW REID.

#### Broseley Tiles.

SIR,—We notice in a recent issue the report of the meeting of the Royal Institute of British Architects, and that papers were read on roof-coverings. We are fully convinced that a discussion of this nature will confer a great benefit on all interested in building. We see that mention is made of the great snowstorm of 1881, and its effects upon the tile-roofs. But of those found to be faulty, the majority would we think be covered with the old-fashioned hand-made tiles; but since that time great improvements have been introduced in their manufacture. They are now made by machinery, by which the camber of each tile is equal, and the joints consequently can be laid closer, so that snow-dust penetration is reduced to a minimum, and when the thaw comes the small quantity that is in the joint follows the underside of the tile until it comes to the bottom end, where it drops into the top of the one below, and so is led right out again to the surface of the roof.

The heavy pressure put on each tile in making consolidates it so much that it becomes far more durable, less absorbent, and a more perfect non-conductor of heat, so that houses so

covered are warmer in winter and cooler in summer than are houses covered in any other manner.

Care should be taken that the tiles are put close up to each other, or the consequence is that they overrun each other, and in a very short distance along the course the overrun is sufficient to cause a straight joint, which, of course, can never be weatherproof. As every one knows, there is a slight difference in the shrinkage in burning, and the tiles will sometimes vary a little in width, causing an overrun; but the introduction of a special-made narrower tile at intervals will at once restore the truth of joint.

In this neighbourhood many roofs are covered with seconds or even thirds tile, not good enough for the market, but, being laid quite dry, without any rendering, pointing, or torching, but with great care as to breaking joint, the roofs are weatherproof, and a hurricane will scarcely move a tile if the wind cannot get inside the roof to lift it from beneath, the thickness of the tile at the edge not being sufficient to allow power for displacement. The nibs on the pressed tiles have so good a grip on the lath that nails or pegs are scarcely needed, in fact if pegs are carelessly used they are often a cause of "roof stripping," for if not driven home the peg will cause the next tile to tilt and so the wind gathers under it and lifts it off, breaking easily the tile or the peg.

Most of the tiles made in this neighbourhood are made with holes and nibs, so that the user can nail or not as he may think best.

Mr. Nevill speaks of a smooth face of cement underneath the tiling; this we think worth consideration, but great care should be taken to have the smoothness he speaks of, for if it is uneven tilting will certainly be the result. Mr. Coldwell speaks of the excessive damage sustained by tile roofs in Essex after the earthquake; this most probably arose from using short, 3 feet laths, which were not so strong or so able to bear the shock as the continuous lath now used for tiling. We cannot see why tile roofs should give way more than any other class of roofing. Tiles have been made in this neighbourhood for many centuries, some specimens having been found at Uriconium, which was built by the Romans A.D. 40, and we think there is no doubt the manufacture has been carried on more or less ever since, and during the last hundred years has largely increased. This, we think, is sufficient evidence to prove that tiles are the most durable and amongst the best of all roof coverings.—Yours, &c.,

Broseley.

BURTON & SONS.

### GENERAL.

**Mr. J. E. Boehm, R.A.**, has received a commission from the Queen for a bust of General Gordon, which is to be placed in the corridor at Windsor Castle.

**The Piccadilly Galleries**, with the exhibition of the Institute of Painters in Oil-Colours, were opened on Sunday last, and the number of visitors was 1,622.

**A large Venetian Mosaic** is now on view at the Glasgow Institute of Fine Arts. It was part of the cargo of the *Austria*, a vessel which was wrecked on Ailsa Craig in October. Afterwards the case drifted to Girvan. There is no clue to the owners.

**Two Groups of Statuary** have been commissioned from Count Gleichen for erection at the Holloway College, Esher.

**Mr. P. W. Adam, A.R.S.A.**, painted the view of Florence which formed part of the scenery in the new play, "The Bachelor of Florence," lately performed by amateurs in Edinburgh in aid of the University Union Building Fund.

**M. Léon** has been awarded the first prize in the competition for the decoration of the Salle des Mariages, in the Mairie of Courbevoie. The second prize has been obtained by M. Chartran, and the third by MM. Delahaye and Picard.

**Mr. Millais, R.A.**, is to paint the portrait of H.R.H. the Princess of Wales, which is to be hung in the Corporation Art Gallery in Manchester.

**Mr. A. Bruce Joy** has completed the monument to the late Sir William Siemens, F.R.S., and it has been placed in Kensal Green Cemetery. It consists of a red Aberdeen granite cross, in which is inserted a medallion portrait in Greek marble.

**A Cast-iron Panel**, designed and modelled by Mr. Chas. H. Jessop, student of the Derby School of Art, has been purchased by the South Kensington authorities as an addition to the national collection of art objects in the museum.

**Mr. C. Purdon Clarke, C.I.E.**, Keeper of the India Section of the South Kensington Museum, has left for Bombay in order to make arrangements for the illustration on a large scale of the handicrafts of India by the selection of native artisans, who will be brought to England, and work at their several trades in the exhibition of 1885.

**Mr. Christian** has prepared designs for a new church, which is to be erected at Longridge, near Preston.

**A Kyrie Society** has been established in Dublin. The first work undertaken has been the decoration of a ward in Stevens's Hospital.

**The Society of Antiquaries** have made a grant of money towards the cost of excavating one of the lake dwellings at Ulrome, near Bridlington. Since 1880 the expenses of the work have been defrayed by Mr. Boynton, of Ulrome Grange.

**The Marquis of Bute** has agreed to lend his collection of pictures to the Queen Park Museum, Manchester, for exhibition. The South Kensington vans are to be employed for removing the paintings.

**Mr. Arthur Cates** has presided at the examination in architecture for candidates for the Associateship held in Manchester during five days in last week.

**An Exhibition Gallery** has been added to the auction rooms of Messrs. Christie, Manson & Woods. It was constructed from the plans of Mr. E. A. Grening.

**An Electric Tramway** is in course of construction at Blackpool.

**Mr. John Morris, Bolton**, has prepared plans for the basement of the new Clarendon Street Board School, to be erected on the site of the old Bolton Moor Reservoir.

**The Duke of Westminster** on Saturday last laid the corner-stone of the Westminster Hospital Medical School in Caxton Street, which is in course of erection from designs by Mr. Stephen Salter.

**Messrs. Carter & Son**, of Winchester, are about to erect a row of shops at Northgate, from the designs of Mr. T. Stopher, architect. It is anticipated that some valuable Roman remains will be found on the site.

**The Tower of Rochdale Town Hall** is to be rebuilt according to designs by Mr. Waterhouse, A.R.A. The work is expected to cost about 16,000*l*.

**The Old Infirmary Buildings** in Edinburgh are about to be removed to make room for School Board buildings. Messrs. Morris & Son are the contractors.

**Mr. W. Williams**, whose design has been accepted for the English church at Cyprus, is a native of Winchester. At present he is engaged in the Government service on the island.

**M. Lauth**, the superintendent of the Sèvres Factory, has completed his new process for the decoration of half-baked porcelain. It was at first proposed to restrict the advantages of the method to French industry.

**A Bill** has been prepared and brought in by Mr. Shaw-Lefevre and Mr. Hibbert giving the Postmaster-General power to acquire lands in London, Birmingham, Bristol, and Newcastle-upon-Tyne, for the purpose of providing adequate accommodation for the public service in those places.

**Messrs. Sinclair & Son**, of Edinburgh, have obtained the contract for the construction of the west wing of the Museum of Science and Art. The Government vote is 20,000*l*. It is stipulated that the work must be completed within two years and a half.

**The Tay Bridge Works** have been visited by Major Marindin, for the purpose of ascertaining the result of the test pressure of the new piers. The results are satisfactory, and the works generally are now appearing to make greater progress.

**Canterbury Cathedral** is to be lighted by means of an electric system before next winter.

**Prince Murat** is erecting a chapel near the Champ de Mars, Paris, which is to be a memorial of the late Prince Imperial. The cost will amount to about 12,500*l*.

**A Bill** has been introduced in the House of Commons for the better preservation of the river Thames above Teddington Lock for purposes of public recreation, and for regulating the pleasure traffic thereon.

**Mr. C. A. Edge**, architect, has recovered 100*l*. damages from the Norwich Fire and Life Assurance Company, for improper interference with the terms of a lease of offices held by him at Bennett's Hill, Birmingham.

**"Round Hill,"** at the rear of All Saints Church, Aldershot, is likely to be selected as the site for the statue of the Duke of Wellington, which was removed from Piccadilly. It now lies at the Ordnance Store.

**Mr. L. Colenutt** has prepared designs for a pavilion which it is proposed to erect at Shanklin.

**A New Infirmary** is to be erected in connection with the Newcastle-under-Lyme Workhouse, and the plans have been approved by the Local Government Board.

**The Montrose Museum** is to be enlarged if funds can be obtained. The subscriptions at present have only reached 550*l*.

**Messrs. Caird & Co.**, of Glasgow, have resigned the contract for plasterers' work at the Belfast Free Library, which was the cause of so much discussion in the town.

**The Lord Mayor** will open the new buildings at the St. Pancras Workhouse, designed by Mr. Bridgman, on Friday next, the 13th inst.

# The Architect.

## THE WEEK.

CHRIST'S HOSPITAL has long been doomed, and projectors of railways and City improvements have during the last twenty years devised many plans for utilising the valuable piece of ground in Newgate Street which is occupied by the buildings. The scheme of the Charity Commissioners, which was made public on Saturday, indicates that the last days of the old school are not far off. It will be succeeded by several boarding and day schools for boys and girls. The Hospital Schools are to consist of a boarding school for 700 boys, one for 500 girls, and a preparatory school for 120 boys, which are to be within a convenient distance of the City. The day schools are to comprise a science school for 600 boys in the City, and a school for 400 girls somewhere within three miles of the Royal Exchange. The existing buildings may be used for the boys' school until other suitable buildings are provided, but no longer. It is recommended that in the construction and arrangement of the buildings for the Hospital Schools provision shall be made for the subdivision and grouping of the scholars with a view to convenience and efficiency of supervision. The buildings for the science school are to include a chemical laboratory and workshops fitted with appliances for working in wood and metal. The best way to appropriate the ground has yet to be determined. The removal of the school would be a favourable opportunity to reconsider the late Mr. PEARSON'S plan for a central railway terminus. It would be difficult to find a better site.

THE official residence for the First Lord of the Treasury, in Downing Street, is not sufficiently imposing, and it is not improbable that Dover House, in Whitehall, will be purchased as a substitute. There is something anomalous in allowing the Government property to be divided by a private house, for at present the Treasury Buildings are separated from the Horse Guards, Admiralty, and the premises acquired for the new offices by that building. Dover House is not without political associations, for it was a residence of Lord MELBOURNE. In case alterations are made, we hope that the screen which was added by JAMES HOLLAND will never be touched. It is a gem of architecture, which becomes the more valuable from the contrast between the Ionic columns and those on the opposite side of the street in the Banqueting House.

AFTER a long and most honourable career in this country, Mr. LOUIS HAGHE died on Monday last, in his seventy-ninth year. When he came here from Tournay the influence of SCOTT'S works was still in the ascendant; there was a sort of sentimental affection for Mediæval work, and the views of old Belgian town halls which HAGHE drew on stone met the public taste. Better work of its class was never produced, and Mr. HAGHE'S splendid plates did much towards the improvement of lithography. Yet, in spite of his fitness, he was never employed on any of the editions of SCOTT. HAGHE soon perceived that England differed from France and Belgium in the value that was set on lithography; however ably a man might use crayons, he was not recognised as an artist. It is an absurd prejudice, and has an ill effect on art in general. LOUIS HAGHE accordingly gave up lithography, and kept to water-colour painting. Although his best work would in other men's hands be considered simply as a background, yet, by his surprising dexterity in rendering details, he compelled the public to admire his drawings. Like all men who have had practice in illustrative work, he was skilful in introducing figures, and their dramatic fitness had much to do with the success of his water-colours. That HAGHE was scenic could not be denied, but the arrangement always displayed admirable management. The esteem in which his brethren of the new Water-Colour Society held him was shown by his election to the vice-presidency, and subsequently to the presidency. When, through ill-health, he was compelled to resign the latter office, the office of honorary president was created for his sake.

By the death of Mr. R. M. PHIPSON, F.R.I.B.A., and the resignation of Mr. BRERETON, the offices of County Surveyor and County Road Surveyor for Norfolk have been rendered vacant. The magistrates resolved to amalgamate the offices, in the expectation of saving 300*l.* a year. On Saturday last there was an election for the new post, and there were no less than one hundred and twenty candidates. A majority of votes was obtained by Mr. W. T. B. HESLOP.

Mr. J. A. CROWE, commercial attaché in Paris, has been appointed to the rank of Companionship of the Bath. Mr. CROWE'S name will be familiar to our readers as one of the authors of the books on Italian painting and painters, which have made "Crowe and Cavalcaselle" almost as well known as "Vasari." Their researches may be said to have revolutionised art history.

At a meeting held at the Liverpool Art Club on Monday, March 9, to discuss the question of the site for the proposed cathedral, speeches were made by Mr. HAROLD RATHBONE, Mr. BARE, Mr. GRAYSON, Mr. BOULT, Mr. SUMNER, Mr. FORD, Principal RENDALL, and others. The opinion of the professional architects was strongly opposed to the St. John's site; its want of size, awkward levels, and the overwhelming proximity of St. George's Hall, were declared to be quite incompatible with architectural effect. The subject is to be further discussed at an adjourned meeting to be held on Monday, March 23.

ON Wednesday evening Mr. MUNDELLA distributed the prizes to the students of the National Art School at South Kensington. Afterwards there was a soirée given by the students, at which probably three thousand people attended, and the amateur concert was successful. According to the report which was read, the prizes gained last year were three gold, twenty silver, and twenty-three bronze medals. There were also eighty-two national competition books, ninety-seven third-grade prizes, and seventy-two prizes of lower value. Travelling scholarships of 50*l.* each were awarded to Messrs. JOSEPH A. PEARCE, ELLIS W. ROBERTS, and GEORGE WARD. Six students in training and one national scholar have been appointed to masterships in schools of art. The total amount of fees received has been 2,802*l.* 12*s.* 6*d.*, made up of 2,539*l.* 8*s.* 6*d.* from day students and 263*l.* 4*s.* from evening students.

Mr. M. E. HADFIELD, who died on Monday in Sheffield, was one of the original members of the Institute, and during half a century of practice he upheld the dignity of the profession. The attacks which have been made on architects counted for little in the town where he lived and was respected. Mr. HADFIELD from his position in connection with the Norfolk estates would be entitled to consideration in Sheffield, but, apart from his office, his character was enough to insure general esteem. He was a man that was without self-seeking, and it might be said of him that his assumption of public offices required no small amount of self-sacrifice on his part. He loved retirement, but people who had grievances and troubles knew where to find him, and much of his time must have been sacrificed in giving advice, of which no account could be taken in a ledger. We shall not anticipate the description of Mr. HADFIELD'S works, which will be read at the Institute on Monday. Some of them are mentioned in another column, and are among those which must be taken as typical examples of the Gothic revival.

THE report of the Artisans, Labourers, and General Dwellings Company, which was read at the general meeting on Wednesday, announces that the directors have under their consideration the question of acquiring a central site in the metropolis for the purpose of erecting block buildings as dwellings for the industrial classes. They consider that such an extension of the Company's operations would assist in meeting the requirements of the large class of artisans who are obliged to live near their work. The exceptionally fine weather of 1884 enabled the building operations in Noel Park to be pushed on with great rapidity, so that at the close of the year 743 houses, including those built or commenced in the previous year, were completed, 465 being let and occupied.

## THE ASSOCIATION SKETCH-BOOK.

THE publication of a volume of the Sketch-book of the Architectural Association is always an event, for, apart from the interest of the subjects, it is a sort of gauge of the latest style of draughtsmanship, and an indication of the men who have most recently made their power felt among the members. This year's volume has an additional advantage, as the ink-photo process of Messrs. SPRAGUE, which was introduced in *The Architect*, gives an opportunity for the reproduction of water-colour and pencil drawings, and there is in consequence not only greater variety in the volume, but far more breadth than is possible with photolithography.

What must first strike the observer as he turns over the sketches, is that there are as many styles as artists. We can find no trace of imitation, and so much independence is a token of the life that is in the Association. It would be vain to deny that from time to time one kind of drawing secures the largest amount of praise, but somehow its admirers are chary of adopting it as a model.

The seventy plates in the volume are taken from England and Wales, France, Germany, Switzerland, Italy, Spain, and Syria. From Scotland and Ireland not one sketch has been derived. Possibly neither country would be satisfied with less than a monopoly of the plates; but, at any rate, the omission is remarkable. The collection commences with a view of the servants' court, Apethorpe Hall, in North Hants, a long, low range of buildings. Like the view of the Stamford and Kingscliff almshouses, which are also by Mr. T. GARRATT, there is no attempt at elaboration or shadows, and for the class of work the style answers well. The sketches of Barkisland Hall and New Hall at Elland and Hartshead Hall, by Mr. W. RILEY, are nearly similar in treatment, but there is less decision, which may have arisen from the use of transfer paper. Mr. G. G. WALLACE's set of geometrical drawings from Beverley Minster are examples of conscientious work, in which every line appears capable of a microscopic test. The sculpture is in consequence a little weak. But in our copy the plates are not well printed, and pale ink does not impart vigour to lines. Mr. WALLACE's colour sketches of Haddon Hall are also carefully finished. Mr. MASEY's measured drawings of Boxgrove Priory show less hesitation, but there is very little ornament to be drawn. The view of Crowland Abbey, by Mr. MILLARD, comes out most effectively. The ink-photo process reveals whether colour has been laid on with decision or not, and generally in this case the result is creditable. The orders in the arching appear rather crude from the effort to express them with the brush as if a pen were used. In the sketch from the Lady Chapel at Ely, the details have been lightly sketched in with a pen, the colour was used in large washes, and the effect is much better. The old house in Carden on Moselle, and the bit from the castle at Landshut, which are entirely brush-work, are, however, the most effective of Mr. MILLARD's plates, and suggest the kind of work for which the process is adapted.

Mr. GOTCH gives a careful drawing of beer-cellars in Drayton House (A.D. 1584), with the crests which are carved on the bosses of the vaulting. It is an interesting example of work, and has the advantage of not being too large to be shown in full on one page. Another type of completeness is the tomb of the mother of Lady JANE GREY (A.D. 1559), from Westminster Abbey, which is apparently an English work, and is an admirable specimen.

Mr. SANKEY's fine view of the Lady Chapel at Ely is apparently outlined in pencil, the shadows being put in by a brush. The subject is difficult, but the view is masterly. The lines of groining and windows are so true it is difficult to believe that they are entirely freehand. The two drawings by Mr. LETHABY are very beautiful, and suggest that they were completed on the spot. The originals seem to have been in pencil. One shows some of the old houses which still survive in Exeter, with quaint bay windows on every storey, while the second gives us dormers and chimney as seen from the roof of the Château at Blois. While boldly drawn, both have a peculiar grace which entitles them to be taken as models. Mr. WILLINS has selected a brass from Felbrigge Church for subject. A drawing of the tower of St. Michael's Church, Gloucester, is by

Mr. WOODWARD, but from its size there might have been more attention given to the details. Mr. NORTON's sketches of English halls are on a small scale, and somewhat old-fashioned in style, but the main lines show a sense of proportion. Mr. A. B. PITE has a characteristic sketch of a curious font, in which figures are rendered with a due recognition of their humour. His second sketch is of pinnacles from Westminster. It might at first sight be taken for a view of an entire structure, and suggests that the builders may have had such an intention. The drawing looks as if it had been made with a quill on transfer paper, and much is gained by using horizontal lines for shadows. In Mr. VACHER's drawing of Howden Church the principal lines appear to have been ruled, the remainder being freehand, and the combination, if open to objections, has at least the advantage that a building which is represented does not look as if it were a ruin. Mr. DAWBAR has a good sketch, although too large for the subject. The views in Rochester and Youghreave Church are more successful. Mr. E. E. DEANE (who is now in Boston, U.S.) represents one of the fine stalls in the parish church at Lancaster. Mr. BIDLAK's two pencil sketches from Leicester have in style a resemblance to Mr. SANKEY's, and the pen drawing of St. Margaret's church tower is one of the best of its class in the volume. Mr. PRYCE is bold enough in his "Maesmawr," but the trees would afford Mr. RUSKIN an opportunity for a sermon on modern indifference to natural forms. The house at Mayfield, by the late Mr. W. J. LANDER, is more suggestive of a tracing than of an outdoor sketch. The four drawings of Minehead Church, by Mr. NEVINSON, are a little heavy, but a country builder would be likely to prefer them to others which are more artistic. Mr. KEMP deserves a word of recognition for his careful drawings from Southwell Minster, and Mr. WOODWARD for the Westminster stalls. There is some uncertainty about what Mr. PHILLIPS means in parts of his sketch from Worcester Cathedral, and it looks as if it had been finished from memory.

The first among the sketches from France are Mr. BAGGALLAY's from Beaugency, showing two picturesque groups. Next comes an able drawing of the palace at Beauvais, from a water-colour by Mr. R. P. SPIERS, by whom there are also a château at Charente and a south-east view of Laon Cathedral. In all of them the parts stand out with much force. We prefer Mr. CARTER's street at Cordes to his courtyard at Vézelay, as in the latter there are far too many random strokes. Among the plates which represent Germany we may mention the Holstein Thor at Lubeck, by Mr. DAWBAR, and the curious leather box from Ratisbon, by Mr. W. A. PITE. The Engadine in Switzerland supplies materials to Mr. LOHR for a plate of wrought metal-work.

The Italian sketches begin with a pen-and-ink drawing of St. Francesco at Assisi, but with buildings of the kind in which there are large expanses of plain surface water-colour drawings are more suitable. Mr. INCE gives some facile bits from Ferrara. Mr. BAGGALLAY, in his sketches from Florence and Prato, does not trust to freehand entirely, and in this way the sharpness of arrisses, which is common in Italy, is suggested. Mr. BALL's view of St. Caterina, Pisa, suffers from neglecting to use ruled lines. The drawing of the Frari, in Venice (a subject which so many artists have attempted), by Mr. LEACH, is rather vague in the windows, owing to some of the lines having failed to appear when transferred to stone. Mr. R. P. CONDER's sketch of a part of St. Mark's is suggestive of detail rather than of general effect. The fine drawings of the ornament on the pilasters from St. Anastasia, Verona, by Mr. HOOPER, deserve especial mention. Lastly come Mr. BURMESTER's two sketches of Spanish towers and the Byzantine capitals in Jerusalem, drawn by Mr. GARRATT, from sketches by Mr. PHENÉ SPIERS.

It has been often affirmed of late that Gothic work is about to be superseded, and that some form of Classic is to be henceforth the fashion. But no one would come to that conclusion from looking over the sketches. They may be described as Gothic in one or another form from beginning to end. The nearest approach to Classicism in the volume is the sketch from the courtyard of the Bourghéroutle Hotel, in Rouen (unless we count the Westminster tomb), and an admirer of PALLADIO would not see much to claim in that façade, although

the ornament is not unworthy of RAPHAEL'S scholars. It will be said that whatever may be the qualities of the buildings which we identify with Greece and Rome, picturesqueness is not among them, while it is the one of all others that is sought in a sketching tour, when time is limited and the space to be covered is extensive. However true that may be, it does not explain entirely the preference for one class of work. Considering that the Sketch-book is a work of reference, and a guide to others, it is impossible to resist the belief that its character has not been fixed by chance, and that editors, committee, and contributors are confident that Gothic has still a future, and that the drawings can be turned to account as well as admired.

### CHARTERED WRONG.

BY LEWIS F. DAY.

THE general depression in trade has led to a good deal of speculation as to its causes, and of suggestions as to the way in which our manufacturers may regain the pre-eminence which it is said they are fast losing. It is thought, no doubt justly, that the artistic element has something to do with the sale of manufactured goods; and technical education is consequently being discussed, and the use of South Kensington questioned. But there is one hindrance at least in the way of the production of anything artistic in manufacture, namely, in the law of copyright—which seems to be expressly designed to legitimise what, but for it, would simply be stealing; and so makes it worth no man's while to encourage English design of a high class. Why should he, when he has only to wait till someone else has produced a good thing which he can appropriate? The obvious result of this must be that men cease to bring out any new thing artistic at all—a result surely not making for the promotion of British commerce.

I lay this to the discredit of the law, because it is tolerably certain that if it were a question of common law no twelve jurymen could possibly be found in whose opinion the appropriation of a design by one man which had been paid for by another, would be anything less than theft. The particular use made of such a design by the appropriator would, in the eyes of straightforward men, innocent of the quibbles in which the legal mind appears to delight, not in the least affect the question of his dishonesty in appropriating, any more than the use made of his ill gotten gains affects the criminality of the man who "lifts" your purse. If there were no statute on the subject, the verdict of a jury would be that what you had bought and paid for was your property, and that any one who filched it from you was subject to the penalty due to thieving; and it is certain that the opportunity, nay the encouragement, afforded by the law to those who have not the probity to pay for that which they can with impunity take, must in the long run chill the enterprise of honest men, and leave production in the hands of persons who do not care how soon an industry is wrecked, so long as they get something substantial out of the wreckage.

It is contended that the imitation in one material of a pattern designed for another, is in no way to the prejudice of the original manufacture. Even if that were so, it would be no argument in favour of design being made by law common property. The petty pilferer who lightens the cash-box is none the less a thief because the man he robs suffers nothing by his loss. If a copyright is worth anything, the owner has a right to it. If it is worth nothing to him, he would probably part with it for the asking—certainly for a consideration. Surely he ought to be allowed to determine whether it is of any use to him, and what it is worth. There might be here and there a dog in the manger who held perversely to what was of no use to him—we are all of us more or less selfish and self-willed—but there is not, that we know of, any law or statute made in the interests of compulsory magnanimity.

But *all* imitation is likely to be prejudicial to the original producer of a pattern. It is obvious to any one not entirely ignorant of the different manufacturing trades that the reproduction of a design in any kindred manufacture must be at the expense of the first producer. Nor is the harm confined to imitations which might haply take the

place of the thing imitated; as, for example, in the case of a wall-paper which is a copy of a silk, a floorcloth which is a copy of a mosaic, or a casting in iron which is a copy of marble or terra-cotta. There is probable harm in any reproduction whatever, no matter how far removed from one another may be the application of the two things. So thinking, the manufacturer who has bought his rights, as he imagines, and paid for them, and has further been at the expense of producing a design, perhaps by a very costly process of manufacture, feels himself aggrieved when he finds it immediately reproduced, maybe by some cheap and nasty process, without so much as "by your leave" on the part of the pirate. In his innocence he seeks the shelter of the law, and finds that it only drips cold water on him. He is informed by the learned judge that it is unlawful indeed to copy that which has been duly registered, but that a copy in another material is not a copy—that the pirate is consequently not a pirate, but a law-abiding and a law-protected appropriator of another man's copyright, and that there is no redress for him, poor man. Pondering over the mystery of this judicial juggling with words, he begins perhaps to doubt the wisdom of fair dealing, and determines not again to speculate in a property which he cannot legally hold.

It is said with some show of plausibility that if the copy is entirely removed from possible competition with the original, no injustice is done to any one by it. But even then it is not quite so. It is the way of the world to run after novelty; and every imitation whatsoever lessens the value of the original in that respect. There is a commercial value in the very rarity of a thing, as every collector well knows; and a manufacturer often pays an artist a good price on the assumption that by so doing he secures something out of the ordinary way. To vulgarise a design is by so much to lessen its value in the market.

The existing state of the law of copyright, or rather the law for defrauding a man of any property in the work of his own brains, has naturally been taken advantage of by those who study the law with a view of seeing how close they can sail to it without coming into collision with it; whose honesty is, in fact, strictly technical.

Thou shalt not steal; an empty feat  
When it's so lucrative to cheat

a man out of the profit which is due to his enterprise. There are certain manufacturers whom to name would, I suppose, be libellous, but who ply their dirty trade openly and unblushingly, laughing cynically at the idea of morality, and growing fat upon the spoils of their more simple-minded, not to say more honest competitors. And the said competitor stands at some disadvantage in the market when he has to compete in price with those who pay nothing for design. It is to be remembered that it is not here and there a design that a fair-dealing manufacturer pays for, but a great number—some of which are never produced at all, others of which prove to be a complete failure. It is only here and there one that is a great success, and to that he has a right to look to recoup him for his outlay in design; but it is just that taking design which is pounced upon, "vulgarised" and "played out" almost as soon as it is produced.

It is only this week, in passing down Newgate Street, I saw in a shop window a copy in linoleum of a well-known nursery wall-paper, designed by Mr. WALTER CRANE for Messrs. JEFFREY & Co. I was interested enough in the subject to inquire of Mr. CRANE and of Messrs. JEFFREY & Co. as to whether they knew anything of the copy, and I found that they had both seen it, but that they had not been consulted as to its piratical production, and believed themselves powerless to oppose it. Here is a case where there is distinct interference with the sale of the wall-paper. Any one who liked the design well enough to purchase it in the form of floor-cloth, would be deterred from papering the walls of his nursery with it by the very consideration that he had used it already on the floor. The artistically ill-advised application of the pattern to floor-decoration, to which it is not adapted, is only adding insult to injury—as is also the villanous rendering of the drawing, which, except that it is villanous, appears to be copied line for line (*i.e.* bad line for good line) from the wall-paper.

There is no reason just now to enter into the question of design, which may be more or less "cribbed." It would naturally devolve upon any one proceeding against another for infringement of his design to show that it was original, and that it had been infringed; but there ought to be no difficulty in putting a stop to deliberate copying. I believe, as I said, that it would be enough to wipe out existing statutes on the subject, and let a jury decide the question on the principles of common sense. But, if that is not feasible, what is to prevent the passing of a law enabling a man to register the copyright of his design *as a design*, and not as applied to some particular manufacture as now? I cannot but believe that English manufacturers would be glad of such a wholesome security as real copyright would give them. And I am certain that it would be to the honour of English manufacture and the benefit of English trade.

## THE ARCHITECTURAL MONOPOLY IN BIRMINGHAM.

A MEETING of the Birmingham School Board was held on the 6th inst., when the arrangements respecting plans of buildings were discussed. Mr. Kenrick, the chairman of the Sites and Buildings Committee, had moved that plans should be obtained for a school in Icknield Port Road to accommodate 1,000 children, and the proposal was said to involve the whole question of the monopoly of the architects.

Mr. Hawkes opposed the resolution on the important ground of whether they should not throw open the competition to the architects of the town. Thirty-three schools had been built, and all by one firm of architects, for a town in which many architects of the greatest eminence resided. Manchester employed more than one architect. Well, Manchester used to be quoted a good deal till Birmingham considered it was superior to Manchester, and now he supposed Manchester quoted Birmingham. Bolton, too, employed more than one architect; Bradford had two; Huddersfield employed several, with 5 per cent. remuneration on the contract, and Nottingham employed a number of architects. Therefore they would see that these enlightened districts thought it fair to give opportunities to a particular profession to compete from time to time. He objected to a single firm being employed over an enormous time when there were other gentlemen equally competent to do the work. As to the hurry to build the school in question, it was quite a surprise to him that they were on the verge of such a precipice. But he was sure that if Messrs. Martin & Chamberlain were spoken to on the subject, they would be willing to do away with any technical difficulties, if any existed, in the way of a great change in the policy of the Board.

The Chairman appealed to the Board not to delay passing the motion. The majority of the Board had for months, nay, years, been pressing upon the town the importance of erecting more schools, and that they had never failed to bring the matter before the Board, and to urge it with all the force in their power. It was not very long since the whole matter was discussed at great length, and the Board decided that it was desirable that the greatest speed should be made with the erection of six more schools, or, at any rate, with the provision of six sites, in order that the schools might be proceeded with as rapidly as possible.

The resolution was adopted.

The Rev. C. Leach moved "That notice be given to Messrs. Martin & Chamberlain to terminate all existing engagements between themselves and this Board on the 8th day of July, 1885; but that any unfinished work which Messrs. Martin & Chamberlain may have in hand on the 8th day of July, 1885, be completed by them, and that their remuneration for such remnants of work be calculated at five per cent. on the amount of the certificates granted to the contractors for work done after the said date; and that the preparation of plans and specifications for all future buildings to be erected by this Board, together with the superintendence of their erection, be thrown open to competition." He said he should be very glad if in the competition with other architects Messrs. Martin & Chamberlain's plans should be found the best, to give them his vote and support. He believed that they had done their work well, and there were more than thirty sets of schools of which he and other ratepayers were proud. In building twenty-nine schools the enormous sum of 15,000*l.* was spent in architects' commission alone. If to that sum were added the amounts received by the firm as payments for quantities and final measurements, surveyors' charges, inquiries as to sites and transfers of sites, the sum would be much larger. There would be some advantages in competition. They would get better schools. There would, too, be a little variety. They would have schools better adapted for the purpose of education, as they were getting

a long way behind, and had to make inquiries from schoolmasters and school teachers. They would get the schools built at a little cheaper rate. They might not get so many blue tiles about the buildings, nor such unsightly heaps of bricks above the roofs—heaps which, while they faintly whispered of some notion of a tower, proclaimed very loudly from the housetop a reckless waste of the ratepayers' money.

Mr. Barnes seconded the motion.

Mr. Kenrick said the question had been discussed several times, but the more people went into the question the more they would be convinced, he felt, that the Board was acting wisely in continuing its present course. The disadvantages of competition were—firstly, the expense as compared with the appointment of permanent architects; secondly, its uncertain results; and, thirdly, he did not believe it would give satisfaction to the town generally. As to the expense, they would observe that one of the towns mentioned as adopting the system of competition paid for commission at the rate of 6½ per cent. In no case where plans were offered for competition was less than 5 per cent. paid. Then it was usual to offer certain premiums, and it was very common and advisable to call in an assessor. Then it might be necessary to pay 2½ per cent. for taking out quantities, as the Board now paid Messrs. Martin & Chamberlain; and if the Board was moderately busy with building schools, as at the present time, the commission was about 3½ per cent. It was 5 per cent. on the first 5,000*l.*, and 2½ per cent. on amounts after that. The actual rate depended upon the quantity of school building. Beyond that there was 1½ per cent. for quantities, making altogether a charge of 5 per cent.; whereas, putting the plans out for competition as he had shown, meant an increased cost of exactly 50 per cent. Then, as to the second point—the uncertainty of the results of competition. It was extremely difficult from plans alone to say how a building would turn out. No doubt this difficulty could be got over by employing an official competent to advise on architectural details; but he (the speaker) would warn the Board that those gentlemen had peculiar notions and ideas as to what buildings should be, and it was extremely likely they would decide in favour of a plan which would not meet with the approval of the Board. As to the third point, he might say he had certain experiences of plans being put up for competition, and he found that the architects invited were often dissatisfied and much irritated with the result. By the present system experience was accumulated, and placed at the service of the Board. The members of the Board would come and go, but each school that was built was a fund of experience to the architect, and that fund, accumulated by constant experience, was of the greatest value to the Board. Besides securing excellent and admirable buildings, it guarded them against the extras of a contract. The extras with the present architects had been extremely small, and in some cases there had been none at all.

The Chairman said he was very glad there had been no reflection on the existing architects. Mr. Leach seemed to fancy that an architect ought to understand exactly what was the best kind of school to be erected; but the questions which the sub-committee recently met to consider were such as an architect's experience could not touch—namely, was it advisable or not that they should continue the system of having central halls, and what was the size of class-room best adapted to their purpose. With reference to the arguments against monopoly, they must remember that the monopoly was created by a previous Board, and that once created it was not easy to deal with, because a certain reflection would be cast upon the architects by any change. But after some years the Board thought it time that the work should be obtained at a smaller remuneration, and acted upon that conviction. He sympathised with the feeling which no doubt existed outside to a certain extent that it would be advantageous to have a great variety in their styles of architecture—but that was secondary altogether to the necessity of adapting buildings to their educational wants, and of using economically the money of the ratepayers. He did not desire to place Messrs. Martin & Chamberlain upon the high pinnacle Mr. Hawkes assumed the majority had imagined them to hold. When he looked at the Mason College he was at once called upon to admit that no building Messrs. Martin & Chamberlain had erected for the Board surpassed that structure in architectural merit. Mr. Chatwin had also erected for King Edward's foundation a most admirable school at Aston, and therefore he would have no hesitation in placing in Mr. Chatwin's hands the erection of a school. But these were times when the Board ought to spend no additional money unless they were very clear that there would be a sufficient return for it. They paid 250*l.* a year as a fixed salary to the architects, and 2½ per cent. commission upon all work over and above 5,000*l.* in one year. His expectation was that during the next few years they would erect two schools per annum, and 2½ per cent. upon 15,000*l.* would be 375*l.* a year as an addition to the fixed salary. But if they threw the new buildings open to competition they would have to pay 5 per cent. upon the whole 20,000*l.*, which would be 1,000*l.* Therefore, under the present arrangements, there would be a net gain of 375*l.*

The Rev. C. Leach asked if Mr. Dixon put it that a 2½ per cent. commission on schools costing more than 5,000*l.* was all that Messrs. Martin & Chamberlain received in addition to the salary of 250*l.* a year?

The Chairman said that possibly Mr. Leach might be referring to the payment for quantities, a payment which, being at the rate of 2½ per cent., was a very low commission, lower than was paid in some other towns, and was got from the builder. Messrs. Martin & Chamberlain were paid also for work done by Mr. Martin as their surveyor, and the commission in that case was also very low indeed. The result of an inquiry as to the usages of Boards in twelve other towns in the matter of architects had been to show that there were six Boards which had appointed special architects, and those Boards were some of the largest in the country—Birmingham, Sheffield, and London—while there were six Boards which had appointed two or more architects. It was not said in the replies whether these latter appointments had all been made by open competition; but, at all events, there was a considerable authority in favour of continuing the present system. The commission paid by the Boards of one architect was between 3 and 3½ per cent., by the others 5 per cent. These were the advantages of the Birmingham and London system. What was hoped for from the other system? They would gain what he might call the advantage of carrying out a sentiment—that of competition against monopoly. But they did not always think the system of open competition the best. They did not in the case of their solicitors, and the experience which a solicitor gained in transacting the business of the Board had very little to do with his decisions, whereas the experience of an architect had an enormous deal to do with the manner in which he would carry out new work. Supposing they changed their architect; what was to become of all those stores of knowledge and experience which were preserved in the head of their present architect, and which could not exist or continue in the minds of the unprofessional members of the Board? Again, they were continually requiring to consult a professional man upon work which did not lead to the erection of the buildings out of which the architect got his remuneration. They had besides that the constant supervision of the existing buildings, of which there were now thirty-three sets, worth hundreds of thousands of pounds. The reports of their clerk of works were submitted to the architect, and he gave his opinion as to whether anything should be done, and, if so, how it should be done. For that they made no payment, and there were scores of similar occasions in which, if the present arrangement were departed from, they would either not get the assistance they needed, and suffer by not getting it, or have to call in some one for the purpose, and how that person was to be remunerated would be a very difficult question. A change, moreover, would entail a great deal of additional work upon a Board which, though it could scarcely have more willing or harder workers, already found it difficult to give the necessary time to its work, and whose officials were overtaxed.

The Rev. W. H. Poulton said it was a question of two or three monopolies held by one firm, and he felt it his duty to vote for the resolution. He did not believe there would be any increase in expenditure as the result of competition.

The Rev. Dr. Crosskey denied that there was any needless waste on the part of the present architects as to ornamentation and the erection of towers, which were used as ventilating shafts on some of the schools. What had been done in this direction had been entirely by the instructions of the committee, and the qualification of taste by a little decorative work had been obtained at a sum so small as not to be worth taking into account.

Mr. Chattaway said he had formerly raised his voice against the monopoly of Messrs. Martin & Chamberlain; but at that time, like many other people now were, he was under a wrong impression—namely, that the architects were paid 5 per cent. commission with extras. As the matter now stood he should vote against the resolution.

The Rev. T. J. Haworth was of opinion that the Board had been working too much in one groove.

The Rev. E. F. M. MacCarthy expressed surprise at such a statement. Let them visit the school in Goodrick Street and the school in Loxton Street, and see the enormous change that had been effected.

Mr. Greening, in supporting the motion, referred to the recent alteration in the architects' remuneration, and observed that if other architects in the town were prepared also to accept a lower percentage the monetary difficulty would be at once removed.

The Rev. C. Leach replied, and the vote was then taken. For the resolution there were seven votes, and the same number against it. The chairman gave his casting vote against the resolution, and it was thus defeated.

**The Ecclesiastical Commissioners** propose to grant 800*l.* to meet a benefaction of a similar sum towards the rebuilding of St. Michael's Vicarage, Wakefield.

## THE LATE MR. M. E. HADFIELD.

ON Monday last Mr. Matthew Ellison Hadfield, architect, died at his house in Sheffield. By his death, says the local *Telegraph*, Sheffield loses another well-known figure, one who linked memories of the past with the movements of the present. His was a manly, self-reliant nature, well able to grapple with difficulties and to overcome them. Of handsome presence, genial spirits, and cultivated talents, he made his own way in the world, rising to a high position in his profession, and taking a prominent though unassuming part in the concerns of the town of his adoption. Sheffield has been the gainer by the long residence of Mr. Hadfield within its borders. He was born at Lees Hall, Glossop, on September 8, 1812, being the eldest son of the late Mr. Joseph Hadfield, who married a sister of the late Mr. Michael Ellison, still honourably remembered in the town as the agent of the Dukes of Norfolk, in which office he was succeeded by his son, Mr. M. J. Ellison. After receiving his education at Woolton Grove Academy, near Liverpool, young Mr. Hadfield, then only fifteen years of age, was placed with his uncle in the Duke of Norfolk's estate office. Mr. Ellison, however, discovering that his nephew had a decided talent for architecture, persuaded his father to article him to Messrs. Woodhead & Hurst, of Doncaster, a firm of very high standing in the county. The indentures were signed in 1831, and continued in force for three years, when Mr. Hadfield went to London, and succeeded in entering the office of the late Mr. P. F. Robinson, one of the architects who gained a premium in the competition for the erection of the Houses of Parliament. These years of probation called forth all the self-reliant qualities of the young man, and when he returned to Sheffield, in 1836, he had acquired confidence and experience to carry on business successfully on his own account. In 1838 he joined in partnership the late Mr. John Gray Weightman, who had been a fellow pupil, and who at the time was engaged upon the plans of the Collegiate School. Offices were taken in the Old Corn Exchange buildings, and here for twenty years a very extensive practice was conducted in all branches of architectural work. The young men threw themselves with great ardour into what was known as the "Gothic revival," then exciting the best minds of the profession, and they measured and delineated many of the old ecclesiastical edifices of Yorkshire and Lincolnshire. They had a special reputation for designs of churches, of which they erected very many in all parts of the country, and in West and South Ireland their practice was very extensive. Mr. Hadfield early in his career took part in the great railway movement which swept over the land. He became associated with the eminent engineer, Mr. John Fowler, under whom he did a great deal of architectural work for the Manchester, Sheffield, and Lincolnshire Company, designing stations and many important groups of buildings, such as the Gorton depôt and extensive buildings at Grimsby. In 1850 the firm took into partnership Mr. George Goldie, and its title then became "Weightman, Hadfield & Goldie." About the year 1858 Mr. Weightman retired, Mr. Goldie following in 1860, and in 1864 Mr. Charles Hadfield joined his father, and the firm has since been known as "M. E. Hadfield & Son."

It is noteworthy that Mr. Hadfield was employed by four Dukes of Norfolk—Bernard Edward (the twelfth duke), Henry Charles (the thirteenth), Henry Granville (the fourteenth), and Henry (the present duke). Amongst a few of the chief works of Mr. Hadfield and his partners may be mentioned the Norfolk Market Hall, the Fitzalan Market, St. Marie's Church, the Gas Offices, the Norfolk Drill Hall, the Catholic schools in Andover Street, Edmund Road, and Shoreham Street; St. Vincent's Church and clergy house, St. Joseph's Home, Queen's Tower, the residence of Mr. Samuel Roberts; Thornbury, the residence of Mr. F. T. Mappin, M.P.; Bleak House, the residence of Mr. John Fowler; the new Corn Exchange, and the new premises of Messrs. Pawson & Brailsford. The farm was designed by Mr. Hadfield on the instructions of the late Duke of Norfolk, by whose orders also he made extensive alterations at Arundel Castle. The erection of St. Marie's Church, Sheffield, was one of the works that established Mr. Hadfield's ability. He was the architect of the Roman Catholic Cathedral at Salford, and amongst other high-class designs may be mentioned Glossop Hall, Derbyshire; Boreatton Park, Shropshire; and the Great Northern Hotel, Leeds. He restored the Shrewsbury tombs in the parish church, and also the Manor Lodge. Mr. Hadfield was one of the earliest associates of the Royal Institute of British Architects. He became a fellow in May 1847, and served on the council during 1866, 1867, and 1868.

Mr. Hadfield was for three years a member of the Sheffield Town Council, and about the same time he served upon the Board of Guardians, and held the position of vice-chairman. The School of Art in Arundel Street was an institution very dear to Mr. Hadfield, who did much to advance its interests. He was present for the maximum period allowed by the trust deed, viz., three years, from 1877 to 1879 inclusive, and retained his seat on the council until his death. He was also one of

the founders of the Gentlemen's Club in Norfolk Street. He held the position of deputy-chairman for some years. Mr. Hadfield was a principal promoter and also the architect of the Royal Victoria Hotel.

Mr. Hadfield was an ardent Catholic, and interested himself very deeply in all that concerned the welfare of his Church. During the later years of his life he devoted much attention to the Roman Catholic Deaf and Dumb Institution, founded in 1870 at Handsworth Woodhouse by the distinguished Belgian philanthropist, Monsignore de Hørne, and afterwards transferred to Boston Spa, near Tadcaster. The institution, which is open to deaf and dumb Catholic children throughout Great Britain, has now 100 inmates, and it owes much of its efficiency to the watchful overlooking of Mr. Hadfield, one of whose last acts was to correct the draft of the annual report.

### ENGLISH PAINTING.

AN address was delivered by Sir Richard Temple at the annual meeting of the Worcester School of Art. In speaking of English painting the lecturer said:—As regards English domestic art, I must be allowed to point out that there is great carelessness, and has been apparently during the last century, in respect to the use of oil pigments. Our English pictures do not last. If you go to see a collection of English pictures at the Grosvenor Gallery, for instance, you will see some have turned black, some turned brown, and some have acquired a yellow hue. All this, no doubt, arises from the careless use of pigments. Our artists trust too much to cheap manufactures. The old masters looked to the making of these pigments, as upon them the permanency of their pictures would depend. Again, there was a great haste to be rich among many of our prominent painters. Most of them paint pictures that will command an immediate price, and look to that rather than to their fame with future generations. Well, perhaps that is natural in this money-making age. Our painters, of course, are like other men. But, notwithstanding, the effect upon art is prejudicial. How many of our historic painters are taking to portrait painting! And the reason is, because it pays; it brings in an immediate income. I ask you to contrast our English art with foreign art, and in what does the main difference consist? I apprehend it consists in this—that English artists perhaps excel in representing still life, and foreign artists excel in representing animated life. It is animation which makes the difference between French, German, and Italian art as compared with British. There is something so staid, so phlegmatic in our disposition that most of our English historical pictures have too much repose. Repose, of course, is a great quality for a picture, but, nevertheless, you may have too much of it. Compare any of the scenes of travel, or of active life, or of war, as painted by Frenchmen, with similar subjects painted by Englishmen, and you will see at once how the enthusiastic, nervous, mercurial, and quicksilver temperament of the French tells. Every touch painted by a French painter has life in it—life, movement, activity; it is instinct with life. That is a grand quality, in which, I must confess, we are comparatively deficient.

### TESSERÆ.

#### Town Churches.

W. BURGESS, A.R.A.

MY own private opinion with regard to town churches is that hitherto we have been playing at them, and that not a single one is worthy to be called a town church. We want churches in this city something like Angevine churches, with great thick walls, domed or vaulted, filled with mosaic inside, and perhaps majolica or mosaic or marble outside. As to putting a little village church in London it is simply absurd. London at the present day is very different from London in the Middle Ages. England in the Middle Ages was something like a third-rate kingdom; at present it is a first-rate, if not the first. London has increased enormously; we are rebuilding it as rapidly as we can, and getting houses five or six storeys high. We might get churches quite as high, and also get great masses, so as to distinguish them from the private houses. The only way to ornament them will be by the assistance of such men as Dr. Salviati, Mr. Fisher, and other artists who work in mosaic. It is an imperishable kind of ornament. If the Angevine type is taken, we can get large broad surfaces, and the mosaic can be done so many square feet a year. It is never finished, but always going on.

#### Recognition of Principle in Ornament.

R. N. WORNUM.

Provided we keep principles in sight, we may change the details at pleasure, whether symbolic or sensuous only, and thus produce that variety of effect so essential to the steady

gratification of the eye. One ornament, in fact, suggests many. On the contrary, if we appreciate only the individual details of an ornament, a whole class or genus is represented by a single specimen, and our resources are reduced to the extremest poverty of expression. This has been actually the case as regards the genus of which the honeysuckle specimen is only a variety. Instead of seizing the principle of this ornament, and treating almost any floral or vegetable, or even symbolic, form in that order of curved series, our architects have been engrossed by the details of an individual, and have acquired only one ornament in the place of thousands which must have suggested themselves had the principle itself been grasped in the first instance instead of the details of only one of its illustrations. There is scarcely a weed in England that might not be treated, on the principle of the Greek anthemion, with nearly equal effect with the honeysuckle, which is only the nearest corresponding type of the ornament in nature. The eye, however, does not admire the anthemion, the echinus, or the astragal because they may be taken from the honeysuckle, the horse-chestnut, and the hucklebone, but because they are admirable details of the illustration of those symmetries and contrasts which by the very nature of vision must, by the gratification of this one of its senses, be delightful to the mind, just as harmonies and melodies delight it through another of its senses. Where the mind views something more than the surface, or where the eyes are ancillary only to the mind, every natural object may be suggestive of some new essential form or combination of forms. The lotus, the lily, and the tulip are but flowers to the many, but to the designer they must be something more. Every individual is but an illustration of a principle, and it is to the constructive principles of his natural models that the designer should give his attention. By separating the minutiae of individual development from the essential strength and elegance of the construction he becomes a creator of new forms, and by this simple exercise of the natural facility of contrivance he combines with the beauty of nature the ingenuity of art.

#### Glasgow Cathedral.

THOMAS RICKMAN.

Glasgow Cathedral is a large and fine cross church, with remarkably short transepts. It has a towering spire at the intersection, and another tower at the west end of the north aisle. The nave and aisles form one church, the choir and aisles another. The transepts and a part of the nave are open as a vestibule for access to each church. The general character of the church is Early English, very excellently designed and executed, and although some part of the work is of later execution, the same style is well kept up. At the end of each transept are additions now in ruins. On the north side of the east end of the choir is the chapter-house, and beneath it and the choir, the crypt. The composition of the nave and choir is different, but each very good. In the choir the capitals of the piers are flowered, in the nave plain. Those in the choir very much resemble some capitals in the transepts at York Minster, and are equally well executed. The west door, now stopped, is one of great richness and beauty, and bears a strong resemblance to the doors of the Continental churches, being a double door, with a square head to each aperture, and the place above filled with good niches. The general design of the doorway is French, but the mouldings and detail English. There is an organ-screen at the entrance into the choir, and one or two ancient monuments. The crypt under the choir and chapter-house is not equalled by any in the kingdom. It is from the fall of the ground well lighted, and is an uncommonly rich specimen of Early English. The piers and groining are of the most intricate character, the most beautiful design, and excellent execution. The groins have rich bosses, and the doors are much enriched with foliage and other ornaments; the piers have fine flowered capitals, much like those in York. This church, like many others in Scotland, is not known or studied so much as it deserves to be.

#### The Look in Portraiture.

R. LIEBREICH, M.D.

To the look, painters, in their composition as well as in their portraits, have always paid great attention. In several of the old masters, it struck me that they had a sort of predilection for a certain direction of the look. Thus Murillo gives the preference to a look of ecstasy directed straight upwards, whilst Guido Reni has a certain predilection for painting an eyeball turned obliquely upwards, and he gives to this direction of the look quite a peculiar character by the posture of the head and position of the eyelids and eyebrows, imitated from the *Laocoon* or the *Niobe*. In his numerous portraits, Vandyke evidently prefers the following direction of the gaze. His portraits look somewhat to the side of the observer into the distance, and in such a manner that the heads turned to the right have their eyes directed to the left, and *vice versa*, the heads turned towards the left have their eyes directed so far to the right that sometimes the iris comes quite near the right

angle of the slit of the lids. Of course those portraits are excepted which represent two persons speaking to each other: for instance, that of Rubens by Vandyke, in the National Gallery. In sculpture the representation of the look is more difficult. There is, above all (at least in our time), the want of colour which, by defining the pupil and the iris that surrounds it, clearly indicates the position of the eyeball. Nevertheless the direction of the eyes is to be recognised, even in the ideal compositions of Classic antiquity, by the position of the eyelids and the shape of the visible part of the eyeball. In the portrait, however, especially in the purely iconic representations, the Greeks used to indicate the pupil by a small flattening of the eyeball, by which the shadow of the upper lid became broader, or they indicated the look in the way on which you see it in the busts of Demosthenes, Pericles, and Alexander the Great, the beautiful originals of which are in the British Museum. In the realistic busts of the Roman time, the pupil was indicated by a small hollow which gave shadow, and the margin of the iris or cornea was designated by a fine engraved circular line. The same, or a similar manner of indicating the pupil has been since adopted by the majority of sculptors, and it is to be considered as a misunderstanding if sculptors of a certain tendency believed that they imitated the antique in the portrait bust, when they left the eyes perfectly expressionless without pupil, with the lids and the eyeball shaped in a conventional curve, by which the inanimate look of the rest of the features was considerably increased.

#### Iron in Architecture.

E. VIOLLET LE DUC.

Men may say that iron can never be employed in our buildings in an outwardly evident manner because it does not lend itself to monumental forms; but it would be more in accordance with truth to say that existing monumental forms, being the consequences of the employment of materials possessing totally different qualities from those of iron, cannot be adapted to the latter material. The logical deduction is that we must not restrict ourselves to those forms, but must devise others appropriate to iron.

#### Etymology of Dome.

HENSLEIGH WEDGWOOD, M.A.

It is doubtful how the word "dome" came to be applied to a cupola, or vaulted roof. A cathedral is in Italian *duomo*, in German *dom*, and a dome may be so called because it was the ornament of a cathedral church. A church in general was called *domus Dei*, the house of God, and probably the name was given to a cathedral church *par excellence*. On the other hand we find that the Greek *dōma* was used for a roof. The word *domus* is commonly derived from the Greek *dēmo*, to build, but this, I believe, is putting the cart before the horse. We have the most natural derivation for the word signifying a dwelling in the notion of a hearth or fireplace. The Finnish *sawu*, signifying smoke, is applied in the second place to a house, household, family living in a house, and in like manner the Welsh *mawg*, smoke, is identical with Breton *moug* or *mog*, a fire, hearth, household, house, while a derivative *moged* is in the latter dialect used for smoke. This mode of expression is almost universal in a rude state of society. "The census includes those provinces beyond the frontiers dependent on the empire which are numbered by fire-places or houses."—"Population of China," Amer. Orient. Soc. Now the Polish *dym* (radically identical with *thumos* and *fumus*) is rendered smoke, cottage, house, while the form *dom* is also used in the latter sense. Bohemian *dym*, smoke; *dum*, a house; where the two senses are distinguished, as in Breton, by the modification *moug* and *moged*. Lithuanian *dumas*, smoke.

#### Greek and Roman Landscape Painting.

E. M. COPE, M.A.

None of the great painters of the most flourishing period of Greek art seem to have paid any attention to landscape. So much as this may, I think, be gathered from the long catalogue of paintings by all the great Greek masters given by Pliny. (Nat. Hist., lib. xxxv.) Amongst the works of Polygnotus, Timagoras, Parrhasius, Zeuxis, Pamphilus, Apelles, Protogenes, Pausias, and many others of less note which he enumerates, no nearer approach to landscape art than grapes (in the famous story of the contest between Zeuxis and Parrhasius), horses, dogs, and oxen is recorded. A certain Pyreicus was held to have degraded himself and his art by painting—what we now prize so highly in the Flemings—barbers' and cobblers' shops, asses, eatables, and such-like. Of another, Serapion, it is said "that he could paint scenes (most likely for the stage) but not men." The art of painting landscapes in fresco on walls was introduced in the reign of Augustus by one Ludius. It does not follow from this that landscapes had not been painted at all before this period. All that Pliny seems to mean is, that they had not been used earlier as ornaments for rooms. They may,

of course, have been introduced by the great masters as accessories and backgrounds for their figures; but, if so, it is at any rate evident from the general tenor of Pliny's remarks that they were of very subordinate interest. All the paintings of antiquity that have been preserved, amongst which are some landscapes, are unfortunately of a period not earlier than the second of the Roman emperors. Winckelmann, who quotes from Pliny the passage about Ludius in support of this opinion, treats no further of Greek landscape, and leaves us in the dark as to the extent to which the elder and better masters carried this branch of art. Lessing justly observes that the want of knowledge of perspective, which appears even in the later works that have been preserved, would alone have operated as a bar to a successful cultivation of landscape-painting. But the motto of all Greek artists, painters included, might have been, "The proper study of mankind is man." Art has occupied itself especially with man, and might say of him, if with more justice than Protagoras, that he is the measure and the rule of all things.

#### Sgraffito.

F. W. MOODY.

What is called the "floating" coat of ordinary plaster, which is usually three-quarters of an inch thick, having been applied to the wall, a layer of black, or any dark-coloured plaster, is then laid about a quarter of an inch thick, and above this another layer much thinner and lighter in colour. Having prepared a charcoal drawing of the figures or ornament you intend to execute, you either trace it or print it on the wet plaster; with a sharp knife you then cut through the upper layer of plaster, and, scraping it away, expose the black wherever you want it to appear. In this way you can execute in a very effective manner any ornament or subject which can be represented in two tints; by using three layers more complicated effects can be produced. I have made many experiments in sgraffito; these may be seen on the back of the New Science Schools at South Kensington. It is a most fascinating process—cheap, effective, and, I believe, durable. There is one modification of it which seems to me to promise success. By laying a thicker outer coat we have been able to carve it almost like a cameo. A frieze of amorini so executed may be seen close to the ground; and I cannot help thinking that sgraffito and the many modifications of which it is capable are well worth the attention of decorative artists and architects.

#### Never too Late to Learn.

B. R. HAYDON.

I am no friend to that lachrymose croaking about time of life: I am just as able now, at fifty-eight years, to set to work on a new acquirement as at eighteen years, and perhaps more able. "Was I to begin the world again," says Reynolds: of course he would do all sorts of things he had neglected to do, and follow Michel Angelo's steps. Now, he had been saying this forty years; why did he not at once, like Tintoretto, write over the door of his painting-room, "The day to Titian, the night to Michel Angelo?" and in six months we should have had his limbs more like legs and thighs than ninepins. Why? Because he only had the consciousness of imperfection, without sufficient power to apply the remedy. After lamenting thus to Burke, he would sit down to a game of whist, or adjourn to the club to listen to the declamations of Johnson. Let every man begin at once, not to-morrow, but to-day, not by-and-by at four, but now, at six in the morning, or as soon as it is light.

#### Assyrian Art.

ROBERT KNOX, M.D.

The Assyrian sculptures represent one race; and the artist being an Oriental, and unequal to the perception of beauty and of truth, represents all figures and every age, male and female, king and priest, lord and servant, on the same model, from which he never varies. This model is the adult male figure of the then existing Assyrian and of the modern Armenian, coarse, abounding in impossible attitudes, and with such a display of the interior, or of the naked anatomy, as to banish from the whole group the slightest pretension to beauty and truth. The limbs are coarse, muscular, and large, with the intermuscular lines or partitions deeply chiselled, as we now see them in the modern Assyrian and Turcoman generally. There is not a correctly formed hand or foot to be seen, nor woman's form anywhere; even the beauty of youth and childhood, which with the beauty of form and proportion constitutes the absolutely beautiful, they could not perceive, though it must have been constantly before them. In what regarded merely animal life the Assyrian artist was equal to the perception of truth; but in attempting to portray man he encountered the prejudices of Oriental civilisation, which forced him into the most common of all errors, the mistaking for truth and beauty the artificial, the fashionable, the conventional, the national, the studied, fanciful, and extravagant; in a word, the theatrical—the figures he found on the world's stage in Nineveh and Babylon.

## NOTES AND COMMENTS.

THE sculptor THEODORE CHARLES GRUYERE died last week in Paris. He was the winner of the Prix de Rome in 1839, and in 1846 he obtained a first-class medal in the Salon. Some of his works have been purchased by the State. In 1868 he modelled for Pondicherry a statue of the Marquis DUPLEIX, the man who, according to MACAULAY, was the first to see that it was possible to found a European empire on the ruins of the Mogul monarchy, and who first practised the arts of war and policy by which English dominion in India was created.

THE decision which was given by Vice-Chancellor BACON in the case of SMETHURST v. HASTINGS cannot fail to make people cautious in entering on building speculations. The defendants were trustees who had powers to invest certain funds in leasehold estates, and accordingly they sunk 6,887*l.* in eleven houses on the Bedford Park Estate. It was alleged that the security was insufficient, and the action was taken to recover the money with interest. After about a week's consideration the Vice-Chancellor ordered present payment of the sum invested, and an inquiry is to be taken as to the amount of interest which is due after credit has been given for all sums which have been paid in respect of interest.

THE main objection of the Vice-Chancellor was that the defendants had not taken the precaution to have what is called a "proper valuation," although both trustees had obtained a report from a surveyor who professed to be well acquainted with the estate. The Vice-Chancellor says that the standard rule is that a trustee is bound to act in the execution of his trust as a prudent man would in dealing with his own property. Apparently the trustees did so. Their surveyor may not have had the gift of prophecy, and could not tell that the Bedford Park Estate was to be made the subject of a contention between rival parochial authorities; but how can any trustee be supposed to test an expert's qualifications? It is admitted that property generally has depreciated. But, according to the Vice-Chancellor, all houses which have an artistic character are to be considered as doomed to deterioration. Considerations such as that the estate found favour with the public, that the houses had been designed by a celebrated architect, and the like, were set aside. "None of these," it was laid down, "can or ought to avail the defendants, or take away from the investments that merely speculative character which is inseparable from them." If the decision is carried out literally there is an end to speculation of all kinds, for, speaking generally, everything for which a higher interest than 3 per cent. is expected possesses a speculative character. Buildings are liable to ups and downs in the same way as molasses or tallow, and money cannot be invested in them without more or less risk. But to say that because property is "fashionable" it is to be avoided by trustees is a dictum which it would be worth while to have debated before several judges.

THE Abingdon Corporation, who invited designs for a new Corn Exchange and Cattle Market, to cost 2,000*l.*, received nine sets of plans. The committee were assisted by Professor HAYTER LEWIS, and selected the design "Bonâ fide," by Mr. C. BELL, F.R.I.B.A., of New Broad Street, London, and "Ne fac nise bene facias," by Mr. J. G. T. WEST, of Abingdon, was placed second; "Comoditas," by Mr. QUILTER, of London, was placed third; and "Z," by Mr. CODD, of Oxford, fourth. The remaining designs, all exceeding the stipulated cost, were not considered by the committee. The requirements were in excess of the proposed outlay, and as a result those architects who kept within the limits of the conditions did so at the expense of elevations. The premiums which fall to Nos. 2, 3, and 4 will not tend to raise the respect due to the ancient borough of Abingdon, at least in the profession, the dignitaries considering 5*l.*, 3*l.*, and 2*l.* an equivalent for the time and pains taken by the unsuccessful men.

It was explained lately by the Rev. G. PRESTON that the streets of Chester correspond exactly with the "ways" of a Roman camp. The following reasons were given. As

thoroughfares in constant use for centuries they would not be likely to be built over, rights of way being always as jealously guarded amongst the Romans as amongst ourselves. Buildings may disappear, but roads and streets (unless after a general conflagration or under a despotically paternal form of Government) do not. Indeed, the antiquary might find some interest in tracing the correspondence of King Street, Princess Street, and the whole of the other streets and passages opening southwards on the south sides of Northgate Street and Bridge Street, to the passages on the Porta-Decumana side of the Via Principalis in a Roman camp. A question was raised by Mr. PRESTON—Why in Chester, which is so much of a Roman city, are there so many gables to be seen in the streets, when we know that in Rome these were only allowed in temples, or occasionally in the houses of pre-eminent Romans, on whom was bestowed the privilege of having a "fastigium" (gable) as a sort of divine honour? No answer was, however, given, and the silence suggests that the Cheshire archaeologists do not attach much value to necessity and convenience.

ONE of the pictures in the exhibition of the Water-Colour Society in Rome is a view of the church of St. Bartholomew the Great in Smithfield. The interior of the building is about the most impressive in London. But everyone is puzzled at the extraordinary encroachment of the adjoining premises across the ambulatory and into the sanctuary. A more strange example of the indifference of churchwardens, clergy, and congregations is not to be found in England. There is now an opportunity to remove the evil. The premises have been offered to the rector and churchwardens for 6,500*l.*, with a refusal till April 3. It is quite impossible for them to raise so large a sum by any means within their personal reach. After careful deliberation, they are driven to make a public appeal for funds. The case is briefly thus:—A shoeing forge standing on the site of the north transept, valued at 1,150*l.*, and a fringe factory standing on the site of the Lady Chapel, valued at 6,500*l.*, are offered for sale. The patron, the Rev. F. P. PHILLIPS, has given the large sum of 2,000*l.* towards the restoration of the church; but unless an additional sum of 7,000*l.* can be obtained by April 3 the purchase cannot be effected, and, if not, this ancient religious site will pass into the hands of the speculative builder and altogether disappear—the beautiful church of Prior Rahere, dating from A.D. 1103, will remain disfigured, desecrated, and exposed to imminent danger from fire.

IF Mr. CARLYLE were now alive, he would point to the agreement between the Government and Messrs. LUCAS & AIRD as a testimony of the truth of his saying that the subject of the modern epic is "Tools and the Man," not "Arms and the Man." It is almost the first time that contractors and navvies have been utilised, for the work in the Crimea of the kind was not extensive. The contractors' charges are not exorbitant, amounting to no more than 2 per cent. on the outlay, or in all 20,000*l.* This is a small sum compared with the price paid as commission on the purchase of the Suez Canal shares.

A COMPETITION has been instituted in Geneva which is suggestive of how well the Swiss manage to promote art without undergoing enormous expense. The section of Decorative Arts in the Genevese Society of Arts having been enriched by five hundred francs, it has been resolved to dispose of the money for the designs which shall be most expressive of the relations and contrasts between Force and Grace. Every one who is living in the city can compete, and there is no restriction as to the class of work. Embroidery, design, painting, sculpture, engraving, marquetry, metal-work, are alike eligible, and while it is permitted to use an existing work of art as a means of inspiration, every servile copy is to be summarily rejected. The jury will consist of thirty members, who are to select the work in which the symbolic idea is shown with most originality and clearness. If the originality of several works should be equal, then finish and elegance of execution are to be considered. The competition is a test of artistic inspiration, and as such might well be imitated in an English town where there is an art school. The works are to be sent in before May 11.

ALFRED WATER

## ILLUSTRATIONS.

ALLERTON, CANNES.

THIS illustration has been reproduced by the ink-photo process, from a fine water-colour drawing by Mr. VATERHOUSE, A.R.A., which was exhibited last year at the Royal Academy.

THE "AURORA," BY GUIDO RENI.

CRITICS have differed in expressing their judgments on the works of GUIDO, but there is a general unanimity about *The Aurora*, which is seen on the ceiling of the casino in the Rospigliosi Palace, Rome. BURCKHARDT is not alone when he says:—"Among modern painters GUIDO in his *Aurora* approaches the nearest to an exalted and free beauty (*hohen und freien Schönheit*), and all things considered, that painting is the most perfect of those which have been produced during the last two centuries?" The painting is so much superior to the majority of GUIDO's works, it is not surprising to find it stated that the design has been taken from an antique bas-relief, which at his time was to be found in the cloister of St. Paul's at Rome.

GUIDO RENI was born in Bologna on November 4, 1575. His father DANIEL was a musician, and it was his desire that his son should likewise adopt music as a profession, but although GUIDO became a respectable performer, it was found very early that Nature had intended him to be a painter. He was placed in the *atelier* of the Fleming DENYS CALVART, but the pupil soon surpassed the master. Then he was attracted by the CARACCI, like many more artists of that age, for the Bolognese were supposed to be the precursors of a new style in which all the merits of the best Roman, Venetian, and Florentine work were to be united. His first picture was *Orpheus and Eurydice*, and it was accepted with general applause. Flushed by success GUIDO attempted fresco painting, and again was successful. With the exception of DOMENICHINO he was the most promising follower of the school, and it is related that LUDOVICO CARACCI became jealous of so much genius, and endeavoured to put GUERCINO before him. His fame reached Rome, and he soon visited the Eternal City. It was at the time when ANNIBALE CARACCI was employed in painting the Farnese Gallery. GUIDO was put in opposition to CARAVAGGIO, and a struggle was commenced which endured for many years. It is remarkable that GUIDO in his first manner was an imitator of his enemy's style. The style which he afterwards adopted, and which is now taken as characteristic of him, might be said to have been the result of a chance remark. It is related that ANNIBALE CARACCI was one day discussing CARAVAGGIO's style, and pointed out that there was room for something which should be the very opposite. The words were an inspiration to GUIDO, who henceforth laboured in the direction suggested: instead of gloom, he sought for brightness and elegance, gave clear outlines, and substituted figures of an exalted type for the commonplace subjects which he had been in the habit of painting.

There was as much difference in character as in style between the two men, and the swaggering CARAVAGGIO appears to have had little difficulty in frightening his rival. But a triumph was gained when a picture of the *Martyrdom of St. Peter*, which had been ordered by Cardinal BORGHESI, was taken out of the hands of CARAVAGGIO in order to be completed by GUIDO.

In time his partisans began to doubt the wisdom of raising a power like GUIDO, and they soon turned their skill to fomenting discords against him. Rome was made too hot for GUIDO, and, as his imagination exaggerated his danger, he fled secretly to Bologna. PAUL V. was then pope, and he blamed those who had aided the escape of the painter. GUIDO was recalled. But it was not until he had received the summons several times that he went back. He was entrusted with many commissions, but his fears continued, and, when he had completed his work, he again sought refuge in Bologna.

His works were in much request, and he might have become one of the richest painters of his time, but GUIDO was kept poor by his passion for gambling. Such, at least, is the tradition, although it may have no more foundation in reality than many others relating to Italian painters. All

his works are not of equal merit, and the existence of so many mediocre paintings, which have been attributed to GUIDO, is supposed to be due to his eagerness to secure funds for the gaming-table. He was attractive as a master, and his studio was crowded with pupils. Under the circumstances there were facilities to produce an unlimited number of "pot-boilers," and GUIDO may have utilised the willing hands which were at his service. His patrons at length became dissatisfied, and GUIDO's latter years were, it is said, embittered by poverty. He died in 1642.

GUIDO is one of the artists who have been selected for commendation by REYNOLDS, on the ground that while their relation to the School of the Caraccis is sufficiently apparent, they "have yet the appearance of men who extended their views beyond the model that lay before them, and have shown that they had opinions of their own, and thought for themselves after they had made themselves masters of the general principles of their schools." In other words, there is a style about his works which is nearly always attractive. It has been said that GUIDO shows more signs of technical skill than of inspiration, and if we accepted some criticisms as conclusive, he was as mechanical in his arrangements as PERUGINO. The following discriminating criticism from LANZI will suggest the merits as well as the defects of the artist.

He was more particularly attentive to the correct form of beauty, especially in his youthful heads. Here, in the opinion of Mengs, he surpassed all others, and, according to Passeri's expression, he drew faces of Paradise. In these Rome abounds more richly than Bologna itself. The *Fortune* in the Capitol, the *Aurora* belonging to the Rospigliosi, the *Helen* to the Spada, the *Herodias* to the Corsini, the *Magdalen* to the Barberini, with other subjects in possession of several princes, are regarded as the wonders of Guido's art. This power of beauty was, in the words of Albano (his most bitter and constant rival), the gift of nature, though the whole was the result of his own intense study of natural beauty, and of Raphael, and of the ancient statues, medals, and cameos. He declared that the *Medicean Venus* and the *Niobe* were his most favourite models; and it is seldom we do not recognise in his painting either Niobe herself or one of her children, though diversified in a variety of manner with such exquisite skill as in no way to appear borrowed. In the same way did Guido derive advantage from Raphael, Correggio, Parmegiano, and from his beloved Paul Veronese, from all whom he selected innumerable beauties, but with such happy freedom of hand as to excite the envy of the Caracci. And, in truth, the artist aimed less at copying beautiful countenances than at forming for himself a certain general and abstract idea of beauty, as we know was done by the Greeks, and this he modulated and animated in his own style. I find mention that, being interrogated by one of his pupils, "in what part of heaven and in what mould existed those wondrous features which he only drew," he pointed to the casts of the antique heads just alluded to, adding, "You, too, may gather from such examples beauties similar to those in my pictures, if your skill be equal to the task." I find, moreover, that he took for model of one of his *Magdalens* the extremely vulgar head of a colour-grinder; but under Guido's hand every defect disappeared, each part became graceful, the whole a miracle. Thus, too, in his naked figures he reduced them, whatever they were, to a perfect form, more especially in the hands and feet, in which he is singular; and the same in his draperies, which he often drew from the prints of Albert Durer, enriching them, freed from their dryness, with those flowing folds or that grandeur of disposition best adapted to the subject. To portraits themselves, while he preserved the forms and age of the originals, he gave a certain air of novelty and grace such as we see in that of *Sixtus V.*, placed in the Galli Palace at Osimo, or in that wonderful one of *Cardinal Spada*, in possession of some of his descendants at Rome.

It is generally believed that the Goddess of the Dawn, who precedes APOLLO and the Hours, is the best figure in the picture. Why there should be seven Hours around the car has not been determined. The number may have been fixed by some canon of the school of the Caraccis, which made ten figures sufficient. It was at one time supposed that the picture was one of those which had been painted on a copper trellis, and fixed afterwards on the ceiling of the casino; but a careful investigation shows that it is painted on a brick lining, and nails are said to have been driven into it probably to *key* the plaster.

The Bishop of Gloucester and Bristol has been offered 10,000*l.* for the erection of a memorial church in the diocese.

## THE ARCHITECTURAL ASSOCIATION.

THE eleventh ordinary meeting of the Association was held on Friday evening, the 6th inst., Mr. Cole A. Adams, president, in the chair. The visit for Saturday (to-day), the 14th inst., was announced to be made to the Hampstead Hospital (Mr. Charles Bell, architect), and to the new Beer-bottling Stores at Kentish Town (Mr. T. K. Green, architect). In connection with the previous visit to Collingham Gardens, votes of thanks were awarded to Mr. A. Waterhouse, A.R.A., the architect; to Mr. L. W. Leeds, for explaining the warming arrangements; and to Messrs. Peto Bros., the contractors. A presentation to the library on the part of Mr. J. L. Pearson, R.A., of a copy of his report on Westminster Hall was announced; as also of forty-nine mounted drawings made by the late Mr. R. C. Page, while holder of the Pugin Travelling Studentship, on the part of his sister.

Mr. J. SLATER then read a paper on

### Building Stones.

The author, after considering the early use of stone, said that he proposed in his lecture to confine himself to the three kinds which are chiefly used for building, viz., granite, sandstones, and limestones. The difference between stratified or sedimentary rocks, and unstratified or metamorphic, was described. It was afterwards explained that granite was one of the earliest stones to be employed, and that wherever it was the staple building stone the architecture was of a somewhat severe and massive type. As a rule, no signs of lamination are visible, and consequently it is not so important in the case of granite as with other stones that it should be laid on its natural bed; but wherever distinct signs of lamination are seen, then it should always be laid on its bed. If granite is required for an extremely exposed situation the grey will probably be found the most useful.

Sandstone is chiefly composed of grains of quartz united by various kinds of cementitious material, either silicious, ferruginous, or calcareous, and it is mainly upon the nature of this cementing substance that the suitability of the stone for building purposes depends. From the composition of sandstone it is less liable to be affected by the weather than limestone, but still great care in selecting a sandstone is required, as the evil results of using inferior qualities are sadly apparent in Chester, Carlisle, and Durham.

Sandstone is composed mainly of the sedimentary deposits of inorganic matter, whereas limestone is largely, and in some cases almost exclusively, formed of the stratified organic remains of living creatures of low organisation. Limestones may be classed for building purposes as crystalline, magnesian, and oolitic. The crystalline limestone generally exists in the form of marble. The Derbyshire, Devonshire, Purbeck, and Irish marbles are now becoming more extensively used for ornamental work; but it should never be forgotten, however tempting it may be to adorn the façades of modern buildings with beautiful variegated marble columns, that the constitution of the material is such that it will not stand if exposed to a smoky atmosphere. The magnesian limestones or dolomites are amongst the best building stones in this country. As a rule they are slightly crystalline, composed in the main of carbonate of lime and carbonate of magnesia with a little silica. At Mansfield, however, the red magnesian limestone has so large a proportion of silica—nearly 50 per cent.—that it is difficult to decide whether to call it a sandstone or a limestone, and, *ceteris paribus*, the silica in a stone determines largely its durability.

The oolitic limestones comprise the well-known Bath and Portland beds, and the renowned Caen stone of Normandy is of the same formation. There are four distinct bands of stone in the series, viz., 1. The inferior oolite, which occurs chiefly in Gloucestershire, from which the stone for Gloucester Cathedral and Tewkesbury Abbey was obtained. The best quarry at the present time is at Painswick. 2. The great or Bath oolite, which is of considerable thickness in the neighbourhood of Bath, and is generally worked by tunnelling, as in Messrs. Pictor's quarries at Box, which extend for many miles underground, and large piers of stone have to be left to support the roof of the workings. Very large blocks of this stone can be obtained. Amongst the best known quarries of Bath stone may be mentioned Corsham Down, Monk's Park, Coombe Down, Box Hill, and Doulting. 3. Coral rag, which passes from Somerset to Yorkshire with numerous interruptions. This is a rubbly stone, and is hardly ever found sufficiently compact to be used for building purposes. 4. Portland stone. This is harder and more durable than most of the lower members of the oolitic series; it is cream-coloured and full of organic remains; in fact, such a quantity of large fossils are found in it that it is unsuited for delicate work. Of the oolitic limestones Portland is certainly the best adapted to resist atmospheric influences, but the modern stone does not seem to be so hard as that which was used in the seventeenth century. In France the great oolite formation yields the

beautiful Caen stone, which is very fine-grained and uniform in texture. This stone has been largely exported into England, and no finer stone can be used for interior work; but many parts of Canterbury Cathedral show only too plainly that it cannot be depended upon in a damp climate for exterior use.

It is necessary that we should have some sort of notion of the causes of the decay of stone. These are, in the main, two—disintegration and decomposition—the former acting mechanically and the latter chemically, and the two causes generally act together. All stones, even granite, absorb a certain quantity of moisture, and, as a general rule, those which absorb the most water are most liable to disintegration, because, after absorption, on the occurrence of the slightest frost, the absorbed water expands, and, by mere mechanical pressure, forces apart the minute particles of which the stone is composed. Hence the rate at which a stone absorbs water and the readiness with which it parts with it are very important elements to be considered, much more so, in fact, than the total amount of water which a stone will take up. It is the constantly-recurring showers and the generally moist atmosphere of this country which play such havoc with our building stones, and it will be readily understood that if one sample of stone when completely saturated absorbs 10 per cent. of its own weight of water and another only 8 per cent., yet if the former takes three times as long as the latter to become saturated, it is, *ceteris paribus*, the better stone. No kind of stone is so variable in this property of absorbing moisture as sandstone, and hence it is extremely important to test it beforehand.

In London, and in any place where the climate is damp and the atmosphere smoky, the mechanical disintegration of stone is largely assisted and frequently started by chemical decomposition. The sulphurous and hydrochloric acids in the atmosphere, which are readily taken up by rain-water, act upon the calcareous ingredients of stone, producing oxidation or hydration; where mineral salts occur, various chemical reactions take place, and minute crystals are formed in the interior of the stone which effloresce outwards; and where organic matter exists, as is the case in nearly all stratified deposits, this gives rise to nitration. Inorganic matter, such as the quartz-crystals which form so large a component in the structure of granite, and the eroded grains of which enter very largely into the composition of many of the sandstones, is not acted on by these acids, so that in a sandstone the nature of the cementitious material which binds the grains together is the important point to be looked to; the more silicious this is and the less calcareous the better. In fact, it may be laid down as a general rule that the more silica there is in a stone the better. If the cementing substance is calcareous, that is, composed of lime, its presence can be detected by the use of dilute hydrochloric acid poured on the stone, which will cause effervescence, and if a powerful action is set up this will show that carbonate of lime is present in considerable quantities. In limestones the main constituent is carbonate of lime. In the magnesian limestones there is a certain proportion of silica, and they are also crystalline in texture, and it is to these qualities that they owe their durability, but their chief constituents are carbonate of lime and carbonate of magnesia. The Commissioners of 1839, who recommended the use of this stone for the Houses of Parliament, correctly appreciated its good qualities, but they appear totally to have ignored the fact that magnesia has a strong affinity for sulphur, which exists so largely in the London atmosphere, and hence has resulted the terrible decay in the stone used in the Houses of Parliament. When we come to the oolitic sandstones, such as Bath, we find no silica at all, but almost entirely carbonate of lime; but as the stone is soft and easily worked, it has been largely used for copings and dressings to brick-built houses in London, and it looks very well when first put up. But in the case of the majority of the pretentious stone enrichments of suburban houses, no care whatever has been taken that the stone should be weathered before using, and it is no uncommon thing to find such stone crumbling away after two years' exposure. But however well this stone may have been weathered, it is extremely doubtful whether it ought under any circumstances to be used in a smoky atmosphere. For dry climates where there is little smoke, and for internal work, it is, however, admirably adapted, as it can easily be worked into most intricate mouldings; but it must always be remembered that in external work elaboration of ornament means increased liability to decay.

The mechanical properties of a stone are no less important. It should be examined for (1) its hardness: a soft, easily-cut stone will not, as a rule, be so durable as a hard crystalline one; (2) its weight: as the denser a stone is, *i.e.*, the greater its specific weight, the more likely it is to last; (3) its compactness, *i.e.*, the closeness of its structure; (4) its porosity; and (5) its colour, if uniformity is desirable. Mr. Hull says that an original bluish-grey tint should be avoided, as this indicates the presence of iron, and oxidation will frequently produce an uneven yellowish tint. These tests are easily made. There are two other very simple practical tests. One is called Smith's test, and it is to take some small chippings from a piece of stone

which has been well wetted and put them in a glass of water, and let them remain for some time, and then gently shake the glass; if the water gets somewhat turbid it shows that there is a certain amount of earthy matter present in the stone. Another test is to boil small pieces of the stone in a solution of sulphate of soda, after which the stone will disintegrate if it be of a perishable nature. This test is, however, a very severe one, and every stone which did not stand it need not be discarded.

When a stone has once begun to decay it is very difficult to stop the process, but several different methods of treating the stone on its first being fixed in order to prevent decay have been recommended, such as Szerelmey's, Hutchinson's, Ransome's, Kühnman's, and others. Boiled linseed oil certainly prevents water entering the pores of a stone, but it slightly darkens the colour, and the application ought probably to be renewed every few years.

There is a familiar clause in a specification which says that stone should always be laid on its natural bed, and it is well that we should all clearly understand why this is so desirable. Nearly all our building-stones have been formed by the deposit of sedimentary matter, layer upon layer, and, however compact a stone thus formed may now appear, all these layers are really existent. A building-stone may be said to resemble a great piece of cardboard a foot thick formed of numerous sheets of paper gummed together and then pressed into a compact mass. If the cardboard were pressed in the same way in which it was pressed during its manufacture, it would only be consolidated the more; but if placed on end and squeezed, there would not be much difficulty in separating the various sheets from one another, and they would soon begin to fall away. This is precisely what takes place when stone is not laid on its natural bed. The ordinary pressure of superincumbent weight might not actually squeeze out the layers of stone, but it would tend to loosen them, and would greatly facilitate the entrance of water between the layers, which would speedily begin to flake off. Another practical point which should always be carefully attended to is that the bedding joints of blocks of stone should be accurately dressed and perfectly level. If this is not looked to, unequal pressure and cross strains will be set up; and stone is one of the worst materials possible to resist cross strains, which is the reason why we so frequently see lintels over window openings cracked.

Stone should never be taken on the credit of its name. The quality of the stone extracted from a quarry is always changing, and for a large building it is necessary constantly to examine the blocks of stone as they are delivered from the quarry. If this is done—if specimens of stone are subjected to a few simple tests—a great deal of worry and disappointment will be avoided.

The PRESIDENT remarked on the difficulty of knowing the bed of a stone after it had been once worked. Speaking of the decay of the stone of the Houses of Parliament, he suggested a theory he had heard advanced by a thoroughly practical and thoughtful architect, that the decay was due to cleaning down the stone after it had been fixed some time instead of cleaning down as the work was carried up, after which only water should be applied to it. After stone has been placed in position a certain efflorescence forms on the surface, which should never be disturbed, as it was an effort of nature bringing about case hardening. He had heard also that dipping stone into lime-water produced case hardening. Linseed oil applied to stone would probably sink in about  $\frac{1}{4}$  inch. Would this make the surface of the stone fall away? In the case of the Elgin marbles, being painted, the oil would have sunk in a certain distance and perhaps caused the surface to flake off to that extent.

Mr. RIDDETT proposed a vote of thanks to Mr. Slater. He remembered that since Wren's time the facilities of traffic had afforded an almost unrestricted choice of stone, but, after all, he thought there was no better stone than Portland for London. Caen stone had had its turn, and Bath stone: the use of this was simple robbery of clients. Stone, no doubt, was like a brand of cigars, and, while the particular bed of stone held out, answered all expectations formed of it. The Henry Clay brand of cigar had continued to be manufactured for years, though there had been none of the leaf since 1879. He thought at the Houses of Parliament the bed of stone had been worked out, and that stone had to be got from another bed. The late C. H. Smith had offered to test every stone put in the building, and the Government were quite willing to accept the offer provided Sir Chas. Barry would pay Mr. Smith. Painting stone tended to seal damp inside the stone; preservatives all had a basis of shellac, and in time the stone must go.

Mr. BLAGROVE seconded the vote of thanks with a few remarks.

Mr. LEONARD STOKES followed in support of the vote.

The PRESIDENT put the vote and it was carried by acclamation.

Mr. SLATER, in his reply, said he agreed that the use of Caen or Bath stone, in London, was to be deprecated.

Victoria stone, or concrete, gave far more durability than any stone M. Viollet le Duc always placed his stone, and had the carving put on at once, and it never was touched after.

## LIVERPOOL ARCHITECTURAL SOCIETY.

THE fourth ordinary meeting of this Society for the current session was held at the rooms, No. 9 Cook Street, on the evening of Wednesday, the 4th inst., Mr. Thomas Mercer, vice-president, in the chair. There was a good attendance of members. It was announced that the Council had decided to award the prize for the best series of sketches executed during the recess by a member of the Sketching Club, to Mr. Walter H. Brierley. Mr. Mercer then read the paper for the evening, by the late W. Pettit Griffith, F.S.A., entitled "The Rigid *versus* the Subtle Styles of Architecture," the proceedings terminating with the usual vote of thanks.

## REPAIR OF CATHEDRALS.

A BILL has been introduced by the Chancellor of the Exchequer and Mr. Hibbert, which has for its object to make better provision respecting the repair of cathedrals and the endowment of deans and chapters in England. It proposes to give powers by which every dean and chapter in England shall set apart a fabric fund amounting to such a sum as may be fixed on the report of the Ecclesiastical Commissioners. Within a year after the order has been made the dean and chapter shall not be entitled to receive for their own use any sum out of the capitular revenues until the fabric fund or a proper proportionate part of it has been set apart. The fund is to be a first charge on the capitular revenues, or obtained in any other way approved by the Commissioners. Accounts are to be annually submitted to the Commissioners showing all expenditure on account of the fund. A dean and chapter may borrow, and the Ecclesiastical Commissioners may lend, on the security of the fabric fund, any capital sum required for the restoration or repair of the capitular buildings, and the dean and chapter may mortgage the fabric fund to the said Commissioners for the purpose of securing the repayment of the sum; the money so borrowed shall be expended to the satisfaction of the Commissioners in substantial repairs, restoration, and improvements of the capitular buildings. Any surplus of the fabric fund in any year over and above the expenditure is to be invested by the dean and chapter until required for the purposes of the fabric fund.

Every dean and canon appointed after the passing of the Act is to be liable to repair any house and other buildings and premises, to the exclusive occupation of which he is entitled in respect of his deanery or canonry, to the same extent as any rector is liable in respect of the house, buildings, and premises belonging to the rectory, and is not to be entitled to any contribution out of the revenues of the dean and chapter in respect of such repair. Provided that where, before the passing of this Act, by any law or custom any such repairs have, in the case of any house, building, or premises of any deanery or canonry been wholly or partly executed at the cost of the revenues of any dean and chapter, the person who first after the passing of this Act succeeds the dean or canon holding such deanery or canonry at the passing of this Act may receive out of the revenues of the dean and chapter such reasonable sum in respect of dilapidations as the Ecclesiastical Commissioners may under the circumstances allow.

In interpreting the clauses, the expression "capitular buildings" is to be taken as meaning the cathedral or collegiate church and the buildings belonging thereto, but does not include any buildings to the exclusive occupation of which any dean or canon is entitled, nor any buildings which are let either at an annual rent or on payment of a fine.

## THE MANCHESTER TOWN HALL.

ON Monday in the Court of Appeal, before Lords Justices Cotton, Bowen, and Fry, there were heard two appeals from an order of Mr. Justice Chitty, who had refused to vary the official referee's finding in respect of a reference made to him. The dispute arose out of the contract to build the Manchester Town Hall, which was accepted at 192,574*l*. The schedule of quantities was filled up by the firm of George Smith & Co., and was accepted by Mr. Waterhouse on behalf of the Corporation on January 17, 1871. The contract, which was expected would be one of profit, turned out to be a serious loss. In March 1872 the partnership of the contractors' firm came to an end, when Mr. Taylor, one of the partners, intimated his intention of retiring from the firm, and accounts were then taken in the usual way. At that date the expenditure upon the Town Hall was 127,462*l*. 9*s*., which was actual cost,

and the value of the work done, according to the schedule of prices, was 73,648*l.* 7*s.* 6*d.* Messrs. Fuller, Horsey & Co. reported that the value of the material and plant was 19,008*l.* The referee found, after hearing the evidence of parties, that the value of the work done was 34,693*l.*, and that the material and plant was worth 22,745*l.* 9*s.* 3*d.* It was contended on behalf of the defendants that there had been much larger deductions made than there ought to have been. The contractors found after they had sent in their tender that they had not "monied" out the ashlar work, which was a considerable item, and when they discovered the mistake they applied to Mr. Waterhouse for the Corporation to amend their tender, but he refused to do it on the ground that it would be most unfair to the other contractors who had tendered. He however gave them the liberty to withdraw their tender on account of the error, but they declined to do it. Subsequently the Corporation allowed the contractors a sum of 10,000*l.* towards the cost of the ashlar work. The representatives of Mr. Taylor now claimed to have an equal share of the amount which had been allowed by the Corporation.

Mr. Philbrick said that there were a great many points in dispute between them, but he thought some arrangement might be come to to avoid the further hearing of the case.

After consultation, Mr. Fullerton said that if the case were allowed to stand over it would probably be arranged.

## Bygones.

"Antiquity after a time has the grace of novelty."—HAZLITT.

### BARRY'S DESIGN FOR THE HOUSES OF PARLIAMENT.

AT a time when the inquiry into the proposed restoration of Westminster Hall has been resumed, it may be interesting to publish the description given by Charles Barry of the principles by which he was governed in making his design for the Houses of Parliament, which comprised an alteration of Westminster Hall. The document was handed in to the Select Committee of the House of Lords on March 8, 1836.

*Style.*—That of the styles proposed, Gothic or Elizabethan, the former of the Tudor period is preferable, as being homogeneous, well defined, and in harmony with the existing ancient buildings proposed to be preserved; whereas the latter is only an incongruous mixture of two styles in their decline, thus being utterly unworthy of the character of a great national edifice as a work of art, besides being at variance with the character of the existing buildings.

*Ancient Buildings.*—That the Hall, the crypt of St. Stephen's Chapel, and the cloister and chapels attached to the late Speaker's residence be preserved, and converted to useful purposes, and that St. Stephen's Chapel be rebuilt.

*Position of Proposed Building.*—That the building be set forward to the east into the river, in order to obtain an enlargement of the two Palace Yards, and thereby make them spacious quadrangles; and that the line of iron frontage be made, as nearly as possible, at right angles with Westminster Bridge; which, it will be seen by a reference to the official plan of the site, is but effected by a line drawn directly from the extremities of the frontage.

*Entrances.*—That the entrance to the Commons and the principal public entrance to both Houses be in Palace Yard, and that the king's and peers' entrances to the House of Lords be in Old Palace Yard, in order that a material portion of the great influx of people attending the Houses may be arrested at the nearest point, namely, New Palace Yard, and that the entrance into Old Palace Yard may be freed from unnecessary obstruction.

*Public Access.*—That, for the greater convenience of approach for the public generally, entrances be made at the south end of Westminster Hall, from Old Palace Yard, and at the old entrance of the House of Commons, opposite Henry VII.'s Chapel.

*River Entrances and Terrace.*—That private entrances to the Houses be made from the river, and a private terrace provided for the recreation of members of both Houses.

*External Approach.*—That, in order to widen as much as possible the entrance into Old Palace Yard, the footpath, which is at present in front of the Italian building containing the Law Courts, be placed in a cloister within such building, which will not only allow the whole width between its south-western angle and the Abbey to be given up to a carriage-road, but also provide a covered walk from Old Palace Yard to New Palace Yard, which, it is presumed, will be found of great convenience for alighting from, and entering into, carriages, and

advantageous as a sheltered walk for persons having to wait in the neighbourhood of the Houses.

*Enclosing East End of New Palace Yard.*—That the east end of New Palace Yard be closed by the river front, in order to shut out from Westminster Bridge an unfavourable view of Westminster Hall, the Abbey, &c., produced by viewing them so much above their ground level; also, for preventing cold draughts of air from the river, which would render the quadrangle an unfit place for horses to be kept in waiting; also for shutting out an unsightly view of the bridge, as seen from Parliament Square, and the quadrangle itself; and, lastly, in order to avoid the necessity of occupying the property on the east side of Abingdon Street, the fee simple of which, alone, would not be of less cost than from 70,000*l.* to 80,000*l.*

*Elevation and Character of River Front.*—That the river front be lofty, and as little broken as may be desirable, to avoid monotony; that the lower, or ground storey and terrace be as simple and as solid as possible, in order to accord with the plainness of the bridge, and form a bold base to the building; and that the superstructure only be of a decorative character, so that the building may present a lofty, imposing, and ornate appearance when viewed from Westminster Bridge.

*Architectural Composition.*—That all the entire mass of building forming the Houses and adjuncts be treated, in its architectural composition, as a single edifice, for the sake of unity, public character, and effect; and that towers be placed at the extreme ends of the proposed mass of building, in order that it may group with the Abbey, &c., and have an imposing effect when viewed with that building. That the details of the river front be large, and those of the other fronts small; as the former can only be viewed from a distance, whereas the latter will be subject to a much closer inspection.

*Palace Yard Fronts.*—That the fronts towards the New and Old Palace Yards and Parliament Square be kept as low as is compatible with the height of the river front, in order not to reduce the importance of Westminster Hall, which must necessarily be a very essential feature of the proposed mass of building, when viewed from the two Palace Yards.

*Approaches generally.*—That the several internal approaches for the king, the lords, the commons, and the public be distinct from each other, and easy of communication when desired.

*King's Entrance.*—That the state entrance for the king be from the south-eastern angle of Old Palace Yard, through a tower, proposed to be of sufficient size to receive the state carriage, which is intended to set down at the foot of a flight of steps of considerable width, leading to a landing hall and gallery, communicating with the king's robing-room at the back of the throne end of the House of Lords. The upper part of the tower to be appropriated to records.

*Peers' Entrance.*—That the private entrance for peers be direct from Old Palace Yard, by means of a flight of steps communicating with a large private lobby, affording access to the House either at the throne or bar ends; and that a distinct approach be provided for the bishops from a quadrangle east of the House to their dressing-rooms, and thence into the House at the throne end, on the opposite side to the entrance for the lay peers. That a water entrance be also provided, to communicate directly with the lobbies and corridors adjoining the House.

*Commons' Entrance.*—That the private entrance for the members of the House of Commons be direct from New Palace Yard, by a flight of steps communicating with a private lobby at the bar end of the House; and that a water entrance be also provided for their accommodation, communicating with the private lobby alluded to, and the corridors adjoining the House.

*Public Entrance.*—That Westminster Hall be the lobby, in common, between the Courts of Law and the Houses of Parliament, and also the grand public approach to the latter; and that for the last-mentioned purpose, as well as to carry on a dignified character of design in such approach, on a scale suitable to the character of the Hall itself, a handsome porch, with a flight of steps, be added at the south end of the Hall, with an opening into it of the rise of the present window when cut down to the level of the porch floor. That from such porch the approach be continued through St. Stephen's Chapel (proposed to be rebuilt, and called St. Stephen's Hall), into a central lobby of great size, lighted by an octagonal lantern midway between the two Houses, and in immediate connection with the public lobbies attached to each; that from such central lobby the public approach be direct, by means of a flight of steps of considerable width, to the committee-rooms in the river front; and that other committee-rooms be provided on the principal floor, with public access to them from St. Stephen's Hall, by which the private accommodation for members of the two Houses may not be interfered with. The porch proposed at the south end of Westminster Hall will present a feature of great interest in the view of the interior, and cause that splendid room to appear only as a part of a great whole, instead of being, as hitherto, an apparently isolated room, without

being any other than as a lobby for counsel and persons in attendance on the Courts of Law.

*Light and Ventilation of Houses and Committee-rooms, and Level of principal Floor.*—That, in consequence of the great height of the Hall, and the level of high-water mark, neither the Houses nor any of the committee-rooms be upon the level of the ground storey; but that, for the sake of height, good light, freedom from damp, and ventilation, they be placed on the principal floor, which is proposed to be made to accord with the old floor of St. Stephen's Chapel.

*Appropriation of Ground Storey.*—That the ground storey be wholly appropriated to record-rooms, public and private approaches, kitchen offices for the several residences which form part of the edifice, kitchen courts, and quadrangles of approach, cellarage under the Houses for warming and ventilating, &c.; and for many other useful purposes, such as store-rooms, clerk of works offices, workshops, &c. Perhaps it might be desirable to have also in this storey a public coffee-house, for the use of the bar and persons attending the Courts of Law and Houses of Parliament.

*Position of Houses.*—That the situation of the Houses be in the centre of the mass of the proposed building, for the sake of convenience, quietude, and freedom from all disturbances from the exterior; also for affording the means of making them of the forms and size best suited to the wants of each House, without interfering with the unity of character maintained throughout the exterior; that all the lobbies and corridors adjoining them be only one storey high, to admit of their being well lighted and ventilated.

*Warming and Ventilating.*—That the warming of the Houses, committee-rooms, libraries, public and private lobbies, and corridors, be by means of warm water in pipes; that the ventilation of them be effected by a very minutely subdivided admission of tempered air from the floor; and that in the Houses especially the current upwards of heated and vitiated air be promoted by means of rarefaction created in a chamber above the ceiling, the air passing into such chamber through the perforated sides of a raised panel in the centre of the ceiling.

*Acoustic Principle of the Houses.*—That, for the purpose of rendering the Houses effective rooms for hearing, in addition to the forms proposed, a continued sounding-board be affixed, so as to surround each House above the seat against the wall; that the walls be entirely lined with oak affixed to battening; and that the ceiling be also entirely lined with oak.

#### HOUSE OF LORDS.

*Form and Arrangement.*—That the form of the House of Lords be an oblong, placed longitudinally to the approach; and that the internal arrangements be in all respects in accordance with those of the old House; that seats for distinguished visitors be above the cove forming the sounding-board over the seat against the walls; that two small, lateral, receding galleries be provided at the throne end; and that the gallery for strangers and reporters be at the bar end; that the lobbies and corridors entirely surround the House.

#### HOUSE OF COMMONS.

*Form and Arrangement.*—That the form of the House of Commons be an oblong, nearly approaching to a square, placed transversely to the approach, and arranged so that the distance from the bar to the chair shall not exceed that in the old House. That the seats for members shall be on the ground floor, and in receding galleries, and all within the least possible distance from the Speaker's chair. That the seats for peers, Speaker's orders, and reporters, be at the chair end of the House; and those for strangers in a gallery at the bar end. That the lobbies and corridors entirely surround the House.

*Libraries and Refreshment Rooms.*—That the libraries and refreshment rooms be upon the level of the floor of the Houses, immediately adjoining and communicating with the private lobbies, so as to be entirely free from intrusion from strangers at all times.

*Committee Rooms.*—That a large proportion of the committee-rooms be upon the principal floor, and the rest in the floor above; that none of them be less than 20 feet of clear height; and that as many of them as possible be placed towards the river front, for the sake of cheerfulness, good light, and ventilation.

*Lords' State Officers.*—That the rooms for the state officers of the House of Lords be in the front towards Old Palace Yard.

*Public Offices.*—That the public offices be immediately adjoining and contiguous to each House, with distinct access for members and the public thereto.

*Official Residences.*—That the whole of the official residences be incorporated in the design for the proposed building, without disturbing its unity of character; and that the principal rooms of each residence be upon the principal floors of the entire edifice, with immediate communication therewith.

#### THE BLACK GATE, NEWCASTLE.

THE Black Gate, in Newcastle-on-Tyne, has been acquired by the local Society of Antiquaries and converted into a museum. The contract for the reconstruction was 1,400*l.*, but with extras, work at the castle, architect's commission, &c., the cost has been about 1,700*l.*

The museum has been opened by the Earl of Ravensworth, president of the Society, and in the address his lordship said that the Black Gate was formerly let out in a parcel of very dirty tenements; it was in imminent danger of being destroyed, and it was through the exertions of many of their leading members and the kindness of the Corporation that the Society acquired it upon liberal terms, and upon a lease which he hoped they would continue to enjoy. They would have an opportunity of seeing what they had never seen before—most interesting Roman altars, votive tablets, and inscribed stones of every description. These had been disposed in various corners and holes of the castle, where it was perfectly impossible for anybody to read them. Now they were displayed in the Black Gate, and the student of antiquarian lore could, with the assistance of learned antiquaries, trace out, with chronological accuracy, and almost historic truth, the history of the Roman occupation, which was remarkable, not altogether as a conquest, but it was the era, the earliest era, of which they knew of English history, of civilisation, and the introduction of fine arts into this country which were previously unknown to our barbaric ancestors. The Romans, who were undoubtedly the greatest military power that ever existed, did not content themselves with merely subduing the people, but taught them the fine arts which they themselves had derived from the Greeks. The works of the great sculptor Phidias, who lived 400 or 500 years before Christ, had never been surpassed or equalled, which showed that there was little new under the sun. Newcastle and its neighbourhood had always been held up as the birth-place of engineering and the cradle of engineering science, and it was curious that they should possess instances of the greatest possible strategic military skill, in that wonderful Roman wall. On entering the Black Gate they would see distinctly where the old portcullis stood. The roadway appeared to have turned very short to the right. Very soon after they had passed the gate, about 15 or 20 paces, stood the roadway, which for many years was called the Black Gate Street. This led to the second gate, which was a very interesting locality. The second gate guarded the drawbridge over the moat, but it was exceedingly difficult, if not impossible, to trace the course of the moat. It formed one of the four entrances from the inner line of fortification, which was always known as the inner wall. Going westward they came to the old gate, which faced as near as possible due west. There were two more gates, the south postern, which faced the Castle Stairs, and which now led down to the Close, and there was the east postern gate, which now led down the Dog Leap Stairs into the Side. Those were the four gates, as far as he could trace. The second gate was flanked by two localities of a very sinister character indeed. On the east and west sides there were pits, which were neither more or less than two gloomy dungeons. It was through the Black Gate that the unfortunate captives condemned to death were led to the place of execution. He had a certain interest in the castle, not only as being a member of the Society of Antiquaries, but he did not know whether many of them knew that his ancestors were the leaseholders of the Castle Garth for a great many years. It was in 1736 that his ancestor Colonel Liddell entered into a competition with the municipality of the town for the renewal of the lease. Colonel Liddell had the best of it, and obtained the lease from the Crown. He held the lease for its term under very curious payment—viz., so many chaldrons of coal, and obtained the lease for the payment of 600*l.* In 1756 the reversion of the lease was again purchased by Lord Ravensworth, who was the nephew of Colonel Liddell. The lease was sold by members of his family to a Mr. Turner, and in 1811, when the Turner estate was sold, the Corporation of Newcastle regained possession of the Castle Garth and its surroundings.

#### EDINBURGH ARCHITECTURAL ASSOCIATION.

THE members of the Edinburgh Architectural Association paid a visit on Saturday to Corstorphine Church and neighbourhood. The party, conducted by the president of the Association (Mr. G. Washington Browne), went first to Old Saughton House. On the way to the parish church, the site of the old castle of Corstorphine was pointed out, as well as the sycamore tree which is said to have been the scene of the murder of the last Lord Forrester. The old stone-built pigeon-house, which belonged to the manor of Corstorphine, and which contains about a thousand pigeon-holes, was also visited. On reaching the church, the party gathered at the entrance, where Mr. Browne gave a short historical account of the earlier

churches which existed before the present collegiate church. Referring to the origin of the name Corstorphine, he said there was a theory that it was a corruption of the French or Norman "Crois d'orfin," and that received some colour from the tradition that the Marechals were strong supporters of the Church, and from the fact that in the first chapel there was a cross in fine gold, but in the foundation charter of 1128 the word was spelt "Crosdorphin," and it was incredible that the French term could have become so corrupted at that early date. The more reasonable theory appeared to him to be that it was simply the Cross of Torphin. That name was not uncommon, and there was a large tract of land in the neighbourhood of West Calder known as Torphin's land. Adam Forrester, the founder of the Corstorphine branch of the family, was a wealthy burgess and Provost of Edinburgh, and purchased the estate of Corstorphine from the Mores of Abercorn, who succeeded to Le Marechals, the earliest recorded lords of the manor of Corstorphine. He took a prominent part in the political history of his time, was knighted in 1402, and died in 1404. The arms and shields which were originally on his tomb are now built into the wall of a little session-house on the west side of the belfry-tower. The earliest record of the first chapel of Corstorphine, which was dedicated to St. Mary, is in the foundation charter of Holyrood House, under date 1128, when the chapel of Corstorphine was added to the abbey of Holyrood. The second chapel, which was dedicated to John the Baptist, was founded at a later date, and was incorporated in the present collegiate church, founded in 1429 by the first Sir John Forrester. Of this edifice the only parts remaining are the chancel, the Forrester vault, and the belfry tower. The old parish church was taken down in 1646, and a new aisle built, which now forms the south aisle and transept of the church. The north aisle and transept were added in 1826. Inside the church the chief points of interest are the old sedilia and piscina in the south wall of the chancel now the vestibule of the parish church—and the three tombs of the Forresters—two in the north wall of the chancel and one in the south transept. The former are in deeply-recessed arches, and contain the remains of the first Sir John Forrester, the founder of the collegiate church, who died in 1440, and his son, the second Sir John Forrester, who died in 1454. The one in the south transept was long reputed to be the tomb of Sir Bernard Smith of Aubigny, who died in Forrester's Castle at Corstorphine, but who was now generally acknowledged to have been buried in Blackfriars' Church, Edinburgh; and it had been established by the best authorities that the third tomb was that of Sir Alexander Forrester, son of the second Sir John, who in 1464 led a pilgrimage to the shrine of Thomas à Becket, and subsequently another to the Continent. In the chancel of the church the company were shown an old sand-glass, said to have been used by John Knox when preaching in Corstorphine. Gibson Lodge, which is reputed to have been built as a portion-house for one of the Dowager Lady Forresters, was next visited. It is a plain, simple, well-proportioned house, displaying no points of marked architectural interest. Cordial votes of thanks were here passed to Mr. Dickson, of Saughton, who had accompanied the party, for his courtesy in throwing open his house; and to Mr. Browne for his interesting description of the places visited.

#### The Restoration of Westminster Abbey.

SIR,—In the interesting paper which was read by Mr Waterhouse at the Academy upon the history and architectural details of Westminster Abbey, particularly upon the lamentable decay of the stone used from time to time in its external construction and repair, these words occurred:—"You will see, therefore, that Westminster Abbey is practically a geological museum of the greatest interest and value to the architect practising in London, enabling him to watch the effect of its climate on almost every description of building stone in common use, *except it be the sandstones so much used in the North*. The terrible effects of our present climate are strikingly exemplified." The italics are the writer's. As will be seen below, there is some point in the exception.

A dozen different places have furnished materials and an additional one—Chilmark in Wiltshire—must be added to the list, as from this locality the stone is being brought for the present extensive restoration. Whether this is a wise selection remains to be seen. Probably this stone was used by the late Sir Gilbert Scott for the restoration of the lower part of the north transept, and if so, Mr. Pearson, the present Abbey architect, may consider that he had no choice but to continue

applying it above that part. But it is never too late to mend if a false step has been taken, and, as this is an interesting, as well as a very important practical, question, it is the hope of eliciting some information as to the durability of Chilmark stone in the destructive atmosphere of London that induces me to write these few words. Though I know it as a beautiful stone for work in the country, that alone is no recommendation for it here, and a trial, an experiment, ought to be out of the question under the circumstances. I should like, therefore, with your permission, to ask what is known of this stone that proves it will be any more durable than those that have previously failed at the Abbey or in its neighbourhood? Is it not an almost unknown stone in London? I can learn nothing satisfactory myself. What I do find is the reverse. It was examined by Professors Wheatstone and Daniell, but rejected by the Royal Commission of 1838. Mr. Hull, the geologist and chemist, one of the latest and best authorities, has not a word to say in its favour in his book on "Building and Ornamental Stones." In fact, he never mentions it, though he speaks of many others from the same formation, remarking that they are all unreliable in smoky towns. Burnell, Ansted, and Paine are silent; but, although there is little special information available, the geology of the district shows that no stone but an oolite can come from Chilmark in Wiltshire, and we know that all oolites and other limestones have decayed with more or less rapidity in London. What else can be expected when they contain about 90 per cent. of carbonate of lime, which effervesces freely at the touch of dilute muriatic, nitric, and other acids—acids ever present in the air of London? Dr. M'Cormack analysed a piece of stone from the old parts of Lambeth Palace, and found hydrochloric acid some inches below the surface, and to that depth the stone was quite disintegrated. The Abbey officials declare they know glazing days at Lambeth from the sulphurous taste of the air. The terrible effects of our present climate upon stone are strikingly exemplified by an incident which occurred in taking down the Chapter-house. Some ashlar was found of Henry III.'s time, with masons' tool marks remaining. The stones were reused externally by Sir Gilbert Scott, and the marks disappeared in less than a year. What emphatic evidence this is of the absolute necessity and duty of London architects to cast aside these unreliable and worthless limestones, and to substitute a trustworthy material worthy of their skill.

Well, sir, it would not be worth while to write all this, nor for you to allow it to be printed, if there was no available remedy, even if a little extra cost should be incurred in the first instance. I say in the first instance, because experience shows that it would ultimately be recovered, for has not the Government been compelled to invest a nice little fortune of 70,000*l.* to provide for the annual expenses of repairing a limestone palace within a stone-throw of the Abbey, which would have been saved if a durable stone had been used? An experience of many years as an architect in the populous towns of the Northern and Midland counties, where limestone is only used for fluxing iron ores, justifies my saying that the carboniferous sandstones with their 90 per cent. of silica and 1 per cent. only of carbonate of lime are the only materials, except the igneous rocks, which are durable in the destructive air of London. For proof, look at the Nelson Column, the Craigleith stone of which has withstood forty years of exposure without injury. The nearest sandstone quarries of Derbyshire are only a few miles more distant than is Chilmark in Wiltshire. With a good trade in prospect, London contractors would doubtless obtain one stone as cheaply as the other, railway managers being always ready for business. The question of extra cost of working hard sandstone is not very serious, as machinery has long been used for beds and joints.

I think, then, if there is any truth in what I have said, the limestones should disappear from specifications for the masonry of buildings of any importance in London, and should be confined to private work under the usual short leases—to showy and rich carving in Bath stone that will last only a few years.

As to the Chilmark stone now being used at the glorious old Abbey, I shall be well pleased to find I am mistaken in thinking so lightly of it as an urban material; but with the evidence I have adduced against it, such an opinion is inevitable.

In conclusion, my only object in this criticism is to aid in terminating the melancholy display of unscientific procedure exhibited by Mr. Waterhouse's catalogue of failures—which, unfortunately, might be very much extended.

Your obedient servant,  
H. TRAVIS.

#### Technical Education and Schools of Art.

SIR,—From personal experience I can say that since the year 1852, schools of art have had one constant aim, namely, the teaching of any and everybody who chooses to learn; and by assisting those who cannot afford the market value of the instruction to use their eyes and fingers, and to place

before the pupils and the public the best and most standard works of all periods of artistic activity as a national benefit, which could not be done by private enterprise.

Whether this is not on too wide a basis to be of much service, from a trading point of view, I cannot say, but I think it is the only one upon which a Government subsidy could be asked or granted.

With all respect for the inquiry now going on, and the opinions of so many eminent men upon this subject of "technical education," I cannot see how any system of "school education" can supply the place of the apprenticeship in the workshop, or supersede the responsibility of the master manufacturers of teaching lads their trade; but the State does supply the practical and intellectual training of a high character to qualify them for a more ready understanding of their business.

That the details of administration by the Department are always conceived or carried out in the best possible way may be doubted; but I am still convinced, after twenty-eight years of actual work, that the one great principle underlying the whole scheme is correct, and that to attempt to introduce a trading element practically would be unwise, impolitic, and useless, if not quite impracticable. I find the great hindrance to youths making greater effort is the want of any hope of promotion in their shop.

As a cotemporary of Mr. Walter Smith, I feel sorry to find that he has so completely altered his opinion, as I remember the time when he was a champion of the cause; but I think he is now a little too dogmatical in his statements.

I have just ascertained that the statements attributed to Mr. Minton, in reference to the Derby School of Art, are incorrect.

Yours, &c.,

AN ART MASTER.

#### Dry Glazing.

SIR,—As so many complaints are being made from time to time respecting the system of "dry glazing," owing to the glass blowing out and becoming loose, and also letting in the wet, may we be allowed to state as briefly as possible some of the causes of this, and also to show to your numerous readers and the profession at large how the same can be remedied and the evil overcome. The many systems of dry glazing now afloat call for a complete inspection and test, so that a thorough comparison of their merits and objections may be met, inasmuch as the sun, acting upon the upper or top part of the bar, so draws it away from the glass that the wind drives the water under the bar, and it of course finds its way in—hence the complaint. Also in time the glass gets loose and is blown out, whilst the rest is left in a very shaky and noisy condition. Many systems also adopt thick paint, indiarubber, felt, and springs, with nuts and bolts. These all, more or less, tend to do more harm than good, and should never be allowed.

Now the glazing we adopt and make is known as the Victoria Dry Glazing, Sam Deards' Patent, Harlow, and is constructed in the following manner:—One zinc or copper bar is made like the small letter *x*, on either side of which we slip in the glass over this bar. We slide our cap as shown in

section, which holds the glass so firmly that, however the wind may blow, yet not a drop of water can enter; and, more than this, by the form of our bar always taking that of the letter *x*, the bar is clipping the glass continually and having, when the cap is slipped on, a firm grasp of the glass, and yet allows of

equal expansion whenever required. We never use any paint, putty, cement, indiarubber, springs, nuts, or bolts of any kind whatever, but merely one screw on top of cap to keep same from slipping, which in no wise interferes with the arrangement of the glass.

As a proof of the many thousands of feet of glass we have supplied and fixed, we have one notable instance on the top of a house five storeys high—Mr. Mayall's studio, opposite the Marble Arch, exposed to the heavy gales and winds for the past three years across Hyde Park, and though the wind has sometimes been enough almost to blow it over, yet it has not been able to blow in one drop of rain.

The glazing we patent and make is now largely used at the Fisheries, Health, and the International Inventions Exhibition. Altogether some 50,000 feet have been used there, and we have given a guarantee that the same is watertight. We shall exhibit at the Building Exhibition, Stand No. 10, Agricultural Hall, next week, and also have a large conservatory erected in the centre of the south promenade at the International Inventions Exhibition during this year. Trusting this letter will receive the due attention of your many readers; any further inquiries we shall be pleased to reply to.

Your obedient servants,

Harlow: March 9.

W. & S. DEARDS.

#### LEGAL.

##### Basingstoke County Court.

BARKER v. DANIEL.

##### ECCLESIASTICAL DILAPIDATIONS ACT.

This was an action brought by Mr. A. R. Barker, architect, to recover 28*l.* 17*s.* 9*d.* from the Rev. A. E. Daniel, rector of Bradley, being the balance of fees due to him, as the diocesan architect and surveyor, in respect of repairs done at Bradley rectory under the Ecclesiastical Dilapidations Act. The plaintiff, in accordance with the bishop's instructions, inspected the rectory in January 1883, and reported on the repairs necessary to be executed under the Dilapidations Act. He also acted for Mr. Daniel privately in superintending certain alterations and additions not falling within the scope of the Act. Negotiations were then opened with the governors of Queen Anne's Bounty, but it was not until October of the same year that a grant was received from them, the amounts paid being 28*l.* for dilapidations, 21*s.* for additions, and 20*s.* for surveyor's fees. Mr. Barker sent, in his claim for 48*l.* 17*s.* 9*d.*, including copies of his report, visits to the rectory, inspecting the work and preparing the plans, and from this he deducted the 20*s.* above mentioned. The contract, it was stated, had been placed in the builder's hands before October, but the work was not proceeded with until after that date, pending the completion of the financial arrangements, and some delay consequently took place, the work being finally completed about March. It was contended that as the rectory was nine miles from Basingstoke, the builder's task was very arduous, and that Mr. Barker could not enforce a penalty for delay provided for in the contract, in respect of which Mr. Daniel now brought a counter-claim. The plaintiff was examined at length in regard to his services. In answer to defendant's solicitor, he said the specification was carried out in the spirit if not in the letter, and he would swear that there had been no interview at which it had been arranged he should accept 5 per cent. on the total outlay to cover all his charges. Mr. C. Wilkins, the builder, also gave evidence. For the defence it was maintained that during a conversation at the rectory, Mr. Barker agreed that his charge, including certificates, should be 5 per cent. on the outlay. He contended further that several things mentioned in the specification had not been carried out, and that Mr. Barker was responsible for this. The Rev. A. E. Daniel gave evidence in support of these statements, and spoke positively as to the arrangement for paying Mr. Barker 5 per cent. commission, to include all his charges. The Assistant Judge said the case was one of considerable difficulty, but he had done his best to give attention to all that had been said. The great difficulty was as to the arrangement for payment by 5 per cent. on the outlay, as to which he had the clearest affirmative from Mr. Daniel and the clearest possible negative from Mr. Barker. In the absence of a line of writing to guide him, he had considerable difficulty, but on the whole his mind was on the side of the defendant. He should therefore give judgment for 24*l.* 15*s.* 7*d.* (5 per cent. on the outlay), and the first item in plaintiff's claim, viz., 6*l.* 11*s.* 8*d.*, for the report and travelling expenses, to which plaintiff was clearly entitled. Deducting from this the amount paid by the Queen Anne's Bounty, there would remain a balance in plaintiff's favour of 11*l.* 7*s.* 3*d.* With regard to the counter-claim he had no such difficulty, for the complaints raised since Mr. Barker began his action should have been settled between Mr. Daniel and the builder. He should therefore dismiss the counter-claim. Plaintiff was allowed costs on the amount of his judgment, and the counter-claim costs were refused.

#### SCHOOL BUILDINGS.

**Edinburgh.**—The plans have been completed by Mr. Wilson, architect, for the South Bridge School, for 1,060 children, which is to be erected on part of the Old Infirmary grounds. On the ground floor towards Drummond Street is the infant department, consisting of three class-rooms, the largest 37 feet by 24 feet, and the others 30 feet by 23 feet. These rooms have movable partitions. At the other side of the school are three juvenile class-rooms, one being the sewing-room. The largest of the three is 31 feet by 24 feet; the other two are each 30 feet by 23 feet. Between these schoolrooms are the entrance doorways and corridors, with cloak-rooms adjoining, and there is on the west side a room for the infant mistress, and on the east a room for the janitor. Separate staircases leading to the flat above are placed in the centre of the landing. On the half landing are cloak-rooms and teachers' rooms. On the upper floor the eight rooms into which it is divided are grouped round the central staircases. The largest of these rooms is 37 feet by 24 feet, and the others are 30 feet by 23 feet. Three of the rooms, as on the ground floor, can, if necessary, be thrown into one large hall. Downstairs the rooms are about 16 feet high; upstairs they are 2 feet more. It is expected that the building will not cost more than 8,000*l.*

## CHURCH BUILDING AND RESTORATION.

**Birmingham.**—A Wesleyan chapel was opened on Wednesday in Gurling Road, Edgbaston. Eventually it is to be used as a lecture-hall and school. Following out the American idea of a central hall, with class-rooms opening out of it, the new chapel has been designed to consist of a main hall, 60 feet by 23 feet, with ten compartments or class-rooms adjoining. The rooms, which are about 12 feet square, are divided from the principal apartment by glazed and revolving partitions and curtains, so that when required they can all be made available for congregational purposes. Provision is also made for the addition of other class-rooms when necessary, and the position of the superintendent's desk enables him to overlook the whole of the class-rooms when occupied by the scholars. Including the class-rooms, the interior dimensions of the building are 55 feet by 60 feet. In place of the conventional pulpit there is a rostrum at the recessed end of the building, and the floor is fitted with pews and chairs for a congregation of 400 persons. The chapel is built of red bricks, with red stone dressings; and in constructing a half-timbered gable the architect has not only made a novel departure from the usual architectural features of a place of worship, but has added picturesqueness. The builders were Messrs. J. Smith & Sons, and Mr. Ewen Harper, 57 Colmore Row, was the architect.

**Plymouth.**—The preliminaries for building the new church at the top of North Hill, opposite the junction with North Road, are almost completed. Messrs. Hine and Odgers, of Plymouth, are the architects. The style will be Perpendicular Gothic. The nave will be of five bays, having clerestories above, pierced by three-light windows. There will be north and south aisles, a chancel 33 feet in length, with clergy and choir vestries on the north side, and an organ-chamber on the south. The tower, battlemented and with pinnacles (and without spire), will be at the west end of the nave, the west doorway being the principal entrance to the church. The tower will be in three stages, and 90 feet in height from the lower floor to the top of the parapet. The ground-floor of the tower will form a spacious vestibule. The windows are of two, three, four, and five lights, with characteristic mouldings and heads, and the window at the east end will be a seven-light one. The roofs will be of the hammer-beam type, and will not be of great "pitch." The church is designed to seat (exclusive of the chancel) 600 persons.

## GENERAL.

**Mr. R. B. Browning**, the painter, was on Monday (which was his thirty-sixth birthday) presented by some of the members of the Browning Society with a set of the various English, American, and Tauchnitz editions of the poems of Mrs. Elizabeth Barrett Browning.

**An Exhibition of Water-colours** will be held in the Corporation Galleries at Brighton in May. Drawings are to be sent to the Pavilion before April 18.

**A Photographic Exhibition**, consisting of the works of amateurs, will be held in New Bond Street next month. Mr. Faed, R.A., and Mr. Mason Jackson will be the judges.

**Mr. Oulless, R.A.**, has completed the portrait of Sir Edward Baines, which is to be placed in the Mayor's Room at Leeds.

**The Collection** of Wedgwood cameos, medallions, busts, and plaques belonging to Mr. T. S. Walker, of Liverpool, will be sold at Messrs. Christie's on April 22 and 23.

**The Sales of Pictures** from the Exhibition of the Glasgow Institute of Fine Arts amounted up to the end of last week to 2,193*l.* 18*s.* 6*d.* Sixty-nine pictures have been sold out of the Manchester Academy of Fine Arts, amounting to about 1,600*l.*

**The Print Room of the British Museum** has been enriched by three drawings by Henry Fuseli, R.A. The subjects are characteristic—viz., *The Nightmare*, *Prometheus*, and *The Destroying Angel*.

**A Music Room** is in course of erection on the vacant ground at the north-east of St. Mary's Cathedral, Edinburgh.

**The Fire** which broke out in the triforium of Glasgow Cathedral on Sunday morning did not cause damage to the extent of more than 50*l.*, as it was speedily extinguished by the caretaker. The origin of the fire is supposed to have been the overheating of a flue in connection with the warming apparatus.

**Mr. T. Hawksley** has asked the Liverpool Water Committee to relieve him of his position as consulting engineer in connection with the construction of the new Vyrnwy Water-works. Mr. Hawksley at the same time intimates his willingness to give the committee the benefit of his experience, should they at any time desire it in the future progress of the works.

**Mr. J. O. Scott** has completed the plans for the restoration of St. Michael's, Coventry. It is proposed to commence the work with the tower and steeple, and perhaps the east end. Four years are to be allowed for the tower.

**A Bust of Robert Burns**, by Sir John Steell, R.S.A. which has been placed in Westminster Abbey, was unveiled on Saturday. The position is in Poet's Corner on the wall against which the monument to Shakespeare stands, immediately above that of Thomson, Southey's being at a corresponding elevation to the left.

**Mr. Armstead, R.A.**, has completed the model of the statue of Lieutenant Waghorn, which is to be erected in Chatham. The pioneer of the overland route is represented in naval uniform, standing bare-headed, with one hand outstretched as if pointing across the desert.

**The Statue of Mr. Leeman, late M.P. for York**, having been completed by Mr. G. W. Milburn, will be unveiled on April 13.

**The Civil Service Estimates** include 10,000*l.* on account of the new Admiralty and War Office, and 10,000*l.* for restoration of Westminster Hall.

**Mr. Gabbutt**, of Liverpool, has obtained the contract for the erection of new law courts, offices, and fire-station at Nottingham, amounting to 61,700*l.*

**Birmingham Architectural Association.**—At last week's meeting a paper was read by Mr. W. Doubleday, on "Symbolism in Art." The lecturer expressed his opinion that the age of symbolism had not passed away, and that in modern architectural works the necessity of symbolic representation would frequently occur, more especially in churches. In the discussion, Messrs. H. H. McConnal, Victor Scruton, J. Cotton, and F. W. Cross took part.

**Steel Sleepers** are to be laid on a length of three-quarters of a mile on the North-Eastern Railway as an experiment. They are 9 feet in length, 9 inches wide, and weigh about 2 cwt. each.

**Mr. J. G. Smith** has offered to pay the cost of restoring the north and south aisles of the chancel of All Saints Church, Maidstone.

**The New Station Platform** on the Glasgow and South-Western Railway at Dumfries has been completed. It is 1,000 feet in length.

**The Bradford Corporation** have a Bill in Parliament for the purpose of raising 450,000*l.* for the improvement of the water supply.

**Mr. A. Banks**, of Oldham, has prepared plans for new Congregational Sunday-schools in that town.

**The Committee** for the Restoration of the Great Screen in Winchester Cathedral, as a memorial of Archdeacon Jacob, have resolved—"That the names of Mr. Bodley and Mr. John D. Sedding be forwarded to the Dean and Chapter, with a recommendation that one or other be selected as the architect."

**The Dunfermline Town Council** have obtained by bequest Sir George Harvey's *Pompeii*, and Sir Noel Paton's *Seizure of Roger Mortimer in Warwick Castle*.

**The Music Committee of the Corporation of London** have decided to recommend that a piece of ground on the Victoria Embankment be secured, and that a building worthy the Corporation be erected thereon at a cost not exceeding 20,000*l.* In the new building it is proposed to have thirty-eight class-rooms, a practice-room, and the usual offices.

**Mr. W. W. Macfarlane** read a paper before the Edinburgh Architectural Association on Monday, upon "The Painter." The author claimed for the decorative painter a position equal to that of the pictorial artist, not only on account of the widespread interest his work was attracting, but also for its educative quality.

**Mr. Archibald Muir** has obtained a warrant to erect forty self-contained houses in a street to be formed near Cambridge Avenue, Pilrig, Leith. The new street will be named Cambridge Gardens, and the houses will be two storeys in height.

**The Working Masons** of Edinburgh have commenced an agitation for securing the eight hours' system. At present the nine hours' system is adopted.

**Mr. John Steel**, of Greenock, has secured the contract for the sheds and warehouses which are about to be erected by the Greenock Harbour Trust at the James Watt Dock.

**The Royal Commission** on the Dwellings of the Working Classes will visit Scotland at Easter, for the purpose of hearing evidence.

**The Restoration of Westminster Hall.**—At the meeting of the Parliamentary Committee on Tuesday, Mr. William Morris gave evidence. He said that the pulling-down of the old Law Courts had exposed to view the side of Westminster Hall and the remains of the foundation; and these, he thought, should be left visible. It was said that it would be necessary to do something for the protection of the side of the wall. He did not think that any measure for that purpose would be necessary; but he contended that if anything was done, it should be merely in the way of protection, and not an attempt at reproduction of the original architecture. It was one of the views of his society that all additions to ancient buildings should be conspicuously modern.

to The Architect.

LONDON, MARCH 14, 1885.

## THE LONDON, TILBURY, AND SOUTH-END RAILWAY COMPANY'S NEW GOODS DEPOT.

THE London, Tilbury, and Southend Railway Company are now building a goods depot and range of warehouses in Whitechapel, which, when completed, will rank amongst the most important of similar undertakings to be found in England. The site on which this depot is being constructed extends from the Blackwall Railway to the Commercial Road, the branch line to the depot, and sidings leaving the main line at the east end of Leman Street Station. The area occupied by the goods station is about 8 acres, and the cost of acquiring the property was £20,000. The Blackwall Railway runs on a viaduct about 17 feet above the street, and the whole of this area has been covered with an arrangement of arches to bring the new depot up to the same level, the road approaches from the main entrance in Commercial Road being made on an incline of one in thirty to the level of the station. The covered portion, or goods station proper, will be 600 feet long by 200 feet wide, and will be occupied by five lines of rails, three platforms 20 feet wide, and three cart roadways, each 30 feet wide, running the whole length of the building. Over this station, and carried by cast-iron columns 2 feet 6 inches in diameter, and a network of steel girders, a warehouse, four storeys high, will be constructed for the exclusive use of the East and West India Dock Company. The available floor-space in this warehouse will be about 12 acres. There will be twenty-five hydraulic cranes on the platforms in the stations, and twenty-four hydraulic lifts, each capable of carrying two tons, will convey goods direct from the platforms to either floor of the warehouse above. By these means the unloading and warehousing of a whole trainload of goods from the docks will be accomplished in a very short space of time. At the south end of the station a hydraulic crane, capable of lifting 20 tons, will be fixed for loading and unloading heavy machinery, &c., and the whole of the shunting will be done by hydraulic capstans fixed in convenient positions. The warehouses will be fireproof, the floors being carried on steel girders amounting in the aggregate to about 8,000 tons in weight. In order to insure the stability of this enormous structure the foundations have been carried down into the London clay about 24 feet below the surface, and are constructed of Portland cement concrete, the piers carrying the main girders being built in blue Staffordshire bricks to the top of the building. On the lower or street level the arching has been so arranged that rails, platforms, &c., can be laid down, and there will consequently be two large railway depôts, one above the other, over the whole area, the upper and lower storeys being connected by hydraulic lifts for the lowering and raising of the railway trucks. The whole of the five lines of rails and the platforms are carried on the patent steel-decking, manufactured and supplied by Messrs. Lindsay & Co., of South Wharf, Paddington.

The works are being carried out by Mr. A. L. Stride, M.Inst.C.E., the engineer and manager of the company, under the superintendence of Mr. Wm. McDonald, the resident engineer. The general contract has been entrusted to Messrs. John Mowlem & Co., of Grosvenor Wharf, and the hydraulic machinery and appliances are being supplied by Sir Wm. Armstrong & Co., Limited. The depot is to be ready for use by the time the docks at Tilbury are opened for business.

## COMPETITIONS OPEN.

**COLCHESTER.**—March 25.—Designs are required for Remodelling and part Rebuilding the Cups Hotel. Mr. H. H. Elwes, Secretary, Exchange and Cups Hotel Company, Colchester.

**CROYDON.**—March 25.—The Corporation desire to Improve Streets in centre of Town of Croydon, and offer prizes of 100%, 30%, and 25% for the three best sets of Plans. Mr. C. M. Elborough, Town Clerk.

## CONTRACTS OPEN.

**ABERDEEN.**—March 23.—For Mason and Slater Work, Wrought-iron Roofs, &c., at Retort House and Coal Stores, Corporation Gasworks.

**ABERGWILL.**—March 24.—For Alterations and Additions to Vicarage. Mr. H. Prothero, Architect, Cheltenham.

**ABERSYCHAN.**—March 14.—For Building Pumping Engine House at Pits. The Ebbw Vale Street Iron and Coal Company, Ebbw Vale.

PORTH.—March 17.—For Building English Congregational Church. Mr. B. Morris, 2 Junction Terrace, Porth, Pontypridd.

PRESTWICH.—March 19.—For Construction of Main Sewer (1,385 yards) and Excavating and Levelling part of Road. Mr. A. W. Grundy, Clerk to the Local Board, Chester Bank, Prestwich.

ROCHESTER.—March 24.—For Alterations and Repairs to Corn Exchange. The City Surveyor, Guildhall, Rochester.

ROTHERHAM.—March 21.—For Making and Delivering 12 Hydraulic Valves, 20 Tees, 4 Flange and Spigot Pipes, 18 Lengths of Gas Mains, Bolts, Nuts, and Washers for the Gas Committee. Mr. S. Brown, Town Clerk, Rotherham.

ROWLEY REGIS.—March 21.—For Building Board School for 400 Children at Spinner's End Cradley Heath. Mr. J. T. Meredith, Architect Bank Buildings, Kidderminster.

# R. ADAMS,

17 BLACKMAN STREET & 7 GREAT DOVER STREET, LONDON, S.E.,

INVENTOR and PATENTEE of the

## SAFETY WINDOW WITH REVERSIBLE SASHES

FOR

### INEXPENSIVE & PERPETUAL CLEANLINESS

Which has gained at the INTERNATIONAL HEALTH and  
SANITARY EXHIBITIONS

2 Gold, 4 Silver, and 4 Bronze Medals,  
and 16 Diplomas of Merit.

The fearful sacrifice yearly of Life and Limb of persons in cleaning windows through sitting or standing outside whilst so engaged is most appalling. This can now be entirely prevented. The Patentee, having given this subject the most exhaustive study, is now prepared to supply his patent fittings suitable both for old and new windows at prices to meet the means of all. These improvements are protected by several patents, by each of which the outside of each sash can be reversed for cleaning, and under this new system that duty is rendered a pleasure, whilst the danger, risk, and tremendous responsibility of moral and statute law is removed.

These patent fittings can be procured from 5s. for each sash, and all builders have the right conferred upon them to fit the same in the purchase thereof, and that all shall have the benefit of this national boon, special Agencies are being established throughout the United Kingdom. None but practical and responsible firms are appointed. Such firms are invited to apply for unrepresented districts at once, as it is desirable to complete the list as soon as possible.

The present representatives are:—

|  |   |
|--|---|
| Barnstaple   | Hanau K, Pilton Street.                   |

# RENDLES ACME GLAZING

Patentees:—**W. E. RENDLE & CO.,**  
3 WESTMINSTER CHAMBERS, VICTORIA STREET, LONDON.

## VENETIAN ENAMEL MOSAIC FOR MURAL DECORATION.

Mosaic Works conducted on the same principle as in Venice and Rome by

**A. CAPPELLO,**  
472 KING'S ROAD, CHELSEA, LONDON, S.W.  
Established in 1880.  
15 YEARS IN ENGLAND WITH DR. SALVIATI.

The above Factory is established in London for the purpose of making the Venetian Enamel Mosaic Work an English trade, and to reduce the cost to half the price that has been hitherto charged abroad or by the London agents.

See "Building News," Oct. 12, 1883, in reference to the Mosaic Pictures for the new Church of the Brompton Oratory, executed by this Establishment.

Gold Enamel Mosaic Work at 15s. per sq. ft.  
Venetian Enamel Mosaic Figure Work at 20s. per sq. ft., including expenses of Fixing.

## MOSAIC PAVEMENTS.

### SURPLUS STOCK.

A Large Quantity of

**PORTLAND SAWN SLABS,**  
Varying from 2" to 8" in thickness,  
TO SELL CHEAP. Must be Cleared immediately.

**STEWARDS & CO., Limited,**  
GROSVENOR ROAD, PIMLICO, S.W.  
R. N. CRABTREE, Manager.

## SALES BY AUCTION.

**FOY, MORGAN & CO.** beg to announce that their Next PUBLIC AUCTION will take place on  
WEDNESDAY, APRIL 1, 1885.

at the BALTIC SALE-ROOM, Threadneedle Street, E.C., when they will offer their usual assortment of DEALS, BATTENS, BOARDS, TIMBER, &c.  
Catalogues will be issued in due time.

**FOY, MORGAN & CO.** {Wood Brokers, 108 Bishopsgate Street Within, E.C.

To be SOLD by PUBLIC AUCTION, pursuant to an Order of the High Court of Justice, Chancery Division, made in an Action Re Van Hagen's Estate, "Spurling v. Rochfort," 1877, V. 53, with the approbation of the Honourable Mr. Justice Pearson, by

**JOHN WHITTAKER ELLIS** (the person appointed by the said Judge), at the Auction Mart, Tokenhouse Yard, in the City of London, on Tuesday, the 17th day of March, 1885, at Two o'clock in the afternoon, in One Lot, the FREEHOLD ESTATE, situate on the west side of the High Road leading from Woolwich to Dartford, in the parish of Bexley, in the county of Kent, known as the Eight Acres, Thomas Lands, Little Brampton Field, Great Brampton Field, Ten-acre Field, and Long-lane Field, containing altogether 72a. 2r. 27p., or thereabouts.

The lands are at present let for market garden purposes, and are in the occupation of Francis Trowell, Esq., as yearly tenant, at the rent of £120 per annum.

Particulars and conditions of sale may be had gratis of Messrs. Rickards & Sons, Solicitors, 2 Crown Court, Old Broad Street, London, E.C.; Messrs. Dixon, Ward, & Co., Solicitors, 10 Bedford Row, London, W.C.; and of the Auctioneer, 29 Fleet Street, and is Old Broad Street, London, E.C.; at the Auction Mart, E.C.; the Bull and Victoria and Bull's Head Hotels, Dartford; Upton Hotel, Bexley Heath; and White Hart Hotel, Bromley. Dated this 6th day of February, 1885.

Rickards & Sons, 2 Crown Court, Old Broad Street, E.C., Solicitors.

## CITY OF LONDON.

St. Paul's School, and 35 St. Paul's Churchyard.  
**MESSES. DANIEL SMITH, SON & OAKLEY** have received instructions from the Worshipful Company of Mercers to LET by AUCTION, at the Auction Mart, Tokenhouse Yard, LONDON, E.C., on Tuesday, March 21, 1885, in one Lot, on lease for a term of 42 years, the very important, substantial, and extensive premises at the east end of St. Paul's Churchyard, which have been for so many years occupied by St. Paul's School, together with the adjoining corner house, No. 35 St. Paul's Churchyard. These premises occupy a position which is almost unrivalled in the City of London, having extensive frontages to St. Paul's Churchyard and Old Change, and also a frontage to Watling Street, and having the great advantage of first-rate light, especially on the Churchyard side.  
The premises occupied by the School and the Masters' houses are extremely strongly and well built, with a fine Classic façade in stone.

The premises are well adapted for any Public Institution requiring a prominent situation and a large building. They are capable of conversion and alteration for commercial purposes, and with the addition of the corner House, No. 35, form such a block of premises as is seldom to be met with in the heart of the City.

The total area is about 10,000 square feet.  
Full particulars, with plans of the premises, may be obtained on application to John Watney, Esq., at the Clerk's Office, Mercers' Hall, Ironmonger Lane, E.C.; of George Barnes Williams, Surveyor to the Company, Mercers' Hall; at the Auction Mart; and of the Auctioneers, 10 Waterloo Place, Pall Mall, S.W.

On Tuesday and Wednesday next.  
Stock-in-Trade of a Looking-glass Manufacturer, Two Horses, Two Vans, superior Office Furniture, including an excellent Cylinder Writing-table, a Two-door Iron Repository, an Iron Safe, Fittings, &c.

**MURRELL & SCOBELL** will SELL, on the premises 65 Mansell Street, Goodman's Field, on Tuesday and Wednesday next, commencing at One o'clock punctually each day, the STOCK of PLATE-GLASS, all foreign, and principally French, comprising 32,520 feet of unsilvered, plain and bevelled, 1500 dozen small sizes, chimney and console glasses and tables, carved and compo frames in the white and gilt, over-mantels, a large mahogany and gilt glass cabinet, mahogany and pine-boards, curl-veneers, work-benches, and numerous effects.

May be viewed two days prior to the Sale.  
Catalogues may be had of Messrs. G. C. Warden & Co., Glass Factors, 14 Queen Street, Cheapside; on the Premises; and of the Auctioneers, 1 Walbrook (opposite the Mansion House).  
Note.—Approved bills will be taken.

**BRADFORD.**

ARCHITECTURAL ASSOCIATION,  
9 CONDUIT STREET, W.

The Twelfth Ordinary Meeting will be held on Friday Evening  
next, March 20, commencing at 7.30, when a Paper will be read by  
L. L. PENROSE, Esq., M.A., on "Proportion in Architecture,  
especially as Exemplified in the Works of the Greeks."

W. H. ATKIN BERRY, } Hon. Secs.  
HERBERT D. APPLETON, }

TO  
ARCHITECTS, BUILDERS,  
AND  
CONTRACTORS.

STEEL CUT NAILS!!

The modern and important discovery in the process of making  
Steel has so reduced the price, that Steel Cut Nails of the well-  
known "Mitre Brand" can now be supplied at only 1s. 6d. per  
cwt. more than the price of the ordinary Common Iron Cut  
Nails.

The Steel Cut Nails are far superior in quality and more uni-  
form in size than any wrought or hand-made Nails yet pro-  
duced, and being lighter in weight than ordinary Iron Cut Nails  
and free from rust, they are found cheaper in actual use than  
common Iron Cut Nails at 1s. 6d. p. cwt. less.

These Steel Cut Nails are specially suited for Builders, Joiners,  
Coopers, Packing-Cas-Makers, &c., and a single trial is sufficient  
to convince any one of their superior quality and cheapness.

PATENT WROUGHT STEEL NAILS.  
OVAL WIRE NAILS.

Ask your Factor or Ironmonger for  
"MITRE NAILS."

WHOLESALE AND EXPORT ONLY.

FIRST-CLASS CERTIFICATE AND SILVER MEDAL  
AT CALCUTTA EXHIBITION.

Cream, Fumigators, &c., &c.

AS SUPPLIED TO 600 PUBLIC HEALTH  
BODIES.

The Sanitas Co., Limited, Bethnal Green E.

**GRUNDY'S PATENT  
WARM-AIR  
VENTILATING FIRE GRATE.**

The novelty, superiority, and advantage of this patent  
consist in the heating surface being greater than any  
other Fire-grate introduced to the public. It is very  
simple in construction, and is made in the form of a Stove,  
the back of which is semicircular in shape, with gills  
behind and smoke-nozzle on top, all cast in one piece.  
The same can be attached to any design of a Register or  
Stove front. It is very suitable for schools, class-rooms,  
waiting-rooms, hospitals, offices, dormitories, and dwelling-  
houses, from the cottage to the mansion. Design and  
specification post free on application.

**TESTIMONIALS.**

"9 Victoria Chambers, Westminster, S.W.

"June 10, 1884.

"SIR,—I have much pleasure in testifying to the  
efficiency of your patent Warm-Air Fire Grate. It has  
been very successful, and given every satisfaction where I  
have used it. Yours, &c.

"To Mr. Grundy. JAMES WEIR, F.R.I.B.A."

"Baptist Chapel, Clapham Common, London. Richard  
Webb, Pastor, 10 Grafton Square.

"February 15, 1884.

"DEAR MR. GRUNDY,—I have pleasure in testifying to the  
excellency and efficiency of your patent Fire-Grate. It is  
the most charming invention for heating a large room I  
have ever known. I shall have pleasure in showing it to  
anyone who wish to have their schools or rooms pleasantly  
and efficiently heated."

From James Garry, Esq., Architect, West Hartlepool,

July 1884.

"DEAR SIR,—I have very great pleasure in stating that  
the first stove, or patent warm-air ventilating fire grate,  
adopted by me in school at Seaton, and a second in a  
Cocoa Palace, have given such satisfaction that I now  
order eleven to be inserted in New Upper Grade Schools in  
course of erection at West Hartlepool. They are the most  
economical, efficient, and easily managed stove at present  
before the public.

"Mr. John Grundy."

From Hon. and Rev. G. G. C. Talbot, M.A., Withington  
Cheltenham.

"DEAR SIR,—You will be gratified to hear that the school  
is completely warmed by your new grate. It is the most  
economical and efficient that I have ever seen."

"Mr. John Grundy."

From F. J. Yates, Esq., Architect, Birmingham.

"The best of the kind I have seen. I shall have pleasure  
in securing their adoption whenever opportunity offers."

# THE "HARDING" VENTILATING COMPANY,

30 EAST PARADE, LEEDS.

## HARDINGS' PATENT AIR DIFFUSER

FOR VENTILATING ALL KINDS OF BUILDINGS.

Mr. T. PRIDGIN TEALE, F.R.C.S., M.A., Surgeon to the General Infirmary at Leeds, says of Hardings' Diffuser in his book called "Dangers to Health":—"I am satisfied that by means of this apparatus, we can secure in a town freshness of atmosphere, absence of draught, and exclusion of dirt."

The fresh air is conducted through a grate and aperture in the wall, as shown on section, about 7 feet 6 inches above the floor level; it is then conveyed through the filter, and passed into the room through a series of small tubes placed at an angle of about 30 deg. with the wall.

By these means the currents of air rushing into the apartment are compressed whilst passing through the tubes. The currents of air, as soon as liberated, expand, cut into, and break each other up, and diffuse in all directions so effectually that no draught or chilly sensation can possibly be experienced by the occupants, and at the same time a large volume of pure air is constantly being admitted and dispensed evenly through the apartments.

Diffuser with Filter.

**CHURCH WALL VENTILATOR.**—As used in the ventilation of Archbishop Zouche's Chapel, York Minster.

The DEAN OF YORK, with reference to the ventilating of Archbishop Zouche's Chapel at York Minster, says:—"I think the ventilation is perfectly successful, and all I have spoken to about it are well satisfied with it, and much pleased with the result."

**OUR PATENT EXTRACTOR** is the best in the Market, and is supplied at a very much lower price than any other.

**CHURCH WINDOW VENTILATOR.**—These Ventilators are used for Churches, Chapels, and other Public Buildings where it is not desirable to have holes cut through the walls to admit air in the usual manner. The appearance is not more noticeable than the ordinary Hopper Ventilator so frequently seen.

"Armley, Leeds, Oct. 29. 1883.  
"GENTLEMEN,—I have pleasure in stating that in my opinion your system of ventilation, introduced in our Church this summer, is a decided success. Heretofore when the Church has been well filled at the Evening Service, I have been almost exhausted by the effort of speaking before I have got half through. On Sunday night, October 7, at our Harvest Thanksgiving, we had a very large congregation, and I preached without the least feeling of weariness or exhaustion. I shall be glad to hear that your Air Diffusers are being widely adopted.—I am, yours truly, JOHN GREGORY, Minister of Oak Road Congregational Church, Leeds."

These Ventilators are more suitable for Schools, Warehouses, and other Buildings where cheapness is an object. The result is precisely the same as in our other styles, at a very much smaller cost.

A reduction in price is made where a number of Diffusers is required.

Estimates and further information given on application to the "HARDING" VENTILATING CO., 30 East Parade, Leeds.

**BUILDING EXHIBITION AT THE AGRICULTURAL HALL.**

THE sixth annual Building Trades Exhibition will be opened on Monday at the Agricultural Hall. Among the exhibitors are some who have not hitherto been represented at this exhibition. Others, again, are on the present occasion conspicuous by their absence, and possibly are reserving their powers for the International Inventions Exhibition; but a large bulk of firms who may always be counted on to give their support to the exhibition will be represented as usual, and, as far as can be judged in advance, the exhibition promises quite to equal, if not to surpass, the preceding ones, and to present in an interesting manner the progress achieved by industry in the time that has elapsed since the exhibitors met last year in friendly rivalry at the Agricultural Hall.

*Robert Boyle & Son.*

Messrs. ROBERT BOYLE & SON, of the Holborn Viaduct and of Glasgow, will, as usual, be represented at the exhibition. Besides the practical businesslike show of apparatus connected with warming and ventilation, by various modifications or by some special principle of action suited

**BELLMAN'S PATENT GULLY.***This Gully possesses the following advantages:—***Receives and disconnects one Rain-water Pipe and Three Waste Pipes.****Avoids all Splashing.****Ventilates the Pipes and Trap.****Forms Drain for Area or Surface.****Is easy of Access for Clearance.**

The ordinary P or S trap to be used in connection with Gully being in a separate piece, can be placed at any angle to meet the drain exactly, thus insuring a perfect joint, the Gully being fixed at right angles. This is a great advantage over other arrangements made with the trap in one piece.

*The Holes for Rain-water Pipes are made both Circular and Square and of various sizes.*

DESCRIPTIVE CIRCULAR ON APPLICATION.

**THIS GULLY IS HIGHLY RECOMMENDED by Authorities on Sanitary Matters.****PRICE AT WORKS, 8/6 EACH.**

Also SINGLE GULLIES, for Sink Wastes only, price 3/9 each.

**BELLMAN & IVEY, 95 Wigmore St., London, W.****ART PLATES FROM "THE ARCHITECT."**

Proof Impressions of the following Illustrations which have appeared in "THE ARCHITECT" can now be obtained in a separate form suitable for Framing:—

**The History of Art.**

In Two Plates, reproduced from the Splendid Painting around Cupola, in Place St.-George's, Paris.

**BY M. FRANCOIS EHRMANN.**

Showing Typical Figures of Ancient and Modern Styles of Art.

Size, Thirty-six Inches by Fourteen Inches.

Price One Shilling each; by post, carefully packed inside patent roller, One Shilling and Threepence each.

May be obtained from all Newsagents or Booksellers, or from the  
 Publishers, **GILBERT WOOD & CO., 175 Strand, London, W.C.**

to meet the circumstances of different needs, to remove foul air and bring in pure air to buildings of all kinds, from the most monumental down to the labourer's cottage, railway carriages as well as ships' cabins, &c.—besides the plain and practical appliances, the same appliances

may be studied under decorative forms. The architectural forms, representing many styles, are quite a striking feature of Messrs. Boyle & Son's exhibit. These ventilators have been designed so as to harmonise with different styles of buildings, and among those shown will be seen elaborate designs in Gothic, Italian,

Classic, and Queen Anne. The latter, a new design, was on view for the first time at the Floral Hall Exhibition, and there it was much admired; and one pleasing detail to be noted in the composition is the roof covered with small red terra-cotta tiles. An elaborate Byzantine design shown at the Floral Hall is absent, but in its place is a design executed from an architect's drawings. If a visitor wishes to see the principles on which air-pump ventilators, soil-pipe ventilators, and cowls, &c., act, he will find models shown by Messrs. Boyle & Son clearly illustrating their action.

#### W. H. Lascelles & Co.

Messrs. W. H. LASCELLES & Co., 121 Bunhill Row, E.C., exhibit at their Stand, No. 128 Avenue C, and 148 Avenue D, some excellent examples of their well-known concrete and joinery. From a well-assorted variety, we especially noticed a concrete bay window and porch, for Messrs. Perry & Co., of Bow, designed by Mr. Basset Keeling; two enriched panels, designed by Mr. J. M. MacLaren, architect; also several finials, copings, balusters, lintels, slabs, &c.; also a fine chimneypiece, with overmantel, designed by Messrs. Ernest George & Peto; and a wainscot door with raised panels and a collection of mouldings, designed by Mr. H. E. Rumble, Eastbourne. The exhibits of this firm are always a source of attraction to the visitors who throng the hall, and the name of the firm is a household word for good work. Greenhouses, conservatories, all sorts of wooden buildings, and, moreover, all varieties of high class joinery are supplied by them. Chimneypieces, dados, stairs, and fittings for churches, public buildings, offices, &c.

#### T. Lawrence & Son.

Messrs. THOMAS LAWRENCE & SON, of Bracknell, Berks, exhibit a moulded brick arch doorway on piers of gauged and moulded brickwork, with the year and wreath of flowers carved over the arch. This, with the handsome oak door and frame, is intended to be used as the private entrance to the Bracknell Supply Store, a handsome building faced with Messrs. Lawrence &

Son's red facing brick, the piers being in gauged work of their noted rubber bricks. The carved work is of the same bricks. A drawing of this building is on view at their exhibit. On one side and the back of their exhibit is shown a specimen of their red wall and roofing tiles, and on the other side strawberry tiles. The tiles manufactured by this firm are made from a clay that resists, when burnt, any weather, and are impervious to moisture, and will retain their colour in any climate and the most exposed place. That the bricks and tiles manufactured by Messrs. Lawrence & Son are giving great satisfaction may be gathered from the fact that year by year their trade is increasing. Last year the works were considerably enlarged, and more bricks and tiles were turned out than in any previous year, and now again, in order to meet the increasing trade, not only are the present works being still further enlarged, but an entirely new brickyard is being opened. This speaks for itself.

#### St. Pancras Ironwork Company.

The ST. PANCRAS IRONWORK COMPANY, St. Pancras Road, N.W., have a choice exhibit of some of their specialties at their stand. Among them we should like to call attention first of all to a beautiful spiral iron staircase of floriated pattern and most artistic composition throughout, from their own designs, and specially suitable for conservatories, private residences, &c., and indeed for any position where the surroundings necessitate a particularly ornamental or high style of work to be in harmony with the rest. The design of the panel balusters, treads, risers, &c., have evidently been carefully studied, and the result is most effective, whether looked at as a whole or as individual specimens of good design in metal-work. From every point of view and in all details down to the smallest, to the very collars of the treads, there is character about the design of the work, power as well as judicious reticence. The company are among the oldest manufacturers of iron staircases in the world, and the increased demand of late years has been met by the firm in a variety of staircases excellently designed and

## READING CASES FOR THE ARCHITECT.

Price Two Shillings. — Office: 175 Strand, London, W.C.

improved in construction, so that they have become serviceable where formerly they would have been considered unsuitable. The spiral staircases made by the company are truly geometrical and self-supporting, which is not always the case in such staircases. Notwith-

standing the good work and the employment of the best material the prices are low, which is rendered possible by the care and attention given to the details of the design, and to the perfection of the manufacturing plant, &c. Besides working out their own designs, architects' drawings are carried out when ordered. Another staircase less elaborate, but of careful and ornamental design, must be mentioned. Our illustration will give an idea of it. The

firm have been carrying out a good deal of work lately in fitting various institutions with staircases, at several infirmaries, &c., and a work has just been completed at the Shoreditch Infirmary, and various lunatic asylums have been fitted with outside staircases as fire-escapes. Visitors to the exhibition will do well to inspect the ornamental wrought ironwork shown. It is all hand-forged, and a capital reproduction of the style of Mediaeval ironwork is presented. A lamp bracket with quaint details, candelabra, balusters, grillework for gate, grillework for segment over gateway, and various samplespecimens of hand-forged work. An elaborate model of a stable is shown, consisting of five stalls and loose box, the stalls furnished with the safety barrier bars, patent paving and gutters for flooring, and glazed tiles at head of stall and round loose box, and the stable fitted with the patent adjustable ventilators. The reputation of the company in regard of specialities and fittings for stables is however well known.

*Robert Adams.*

Mr. ROBERT ADAMS, of 7 Great Dover Street, Borough, shows a new patent spring hinge, "The Victor." This is a hinge designed to obviate the discomfort arising from swing doors in exposed situations, which do not offer sufficient opposition to strong winds, so that intolerable draught fills the building. This spring is so made that the slightest pressure in one direction will swing the door open, from the other direction it can only be opened by main force. By a simple operation the hinge can be made to act in the reverse direction. The spring only cushions a quarter of an inch in working the door three-fourths of the entire circle. The pivots working on centres in the levers have but little friction, and the wear can be compensated by turning set screws at will. The obvious utility of the spring hardly needs to be dwelt on. Mr. Adams has introduced various modifications and improvements in certain of his well-known specialities. An improvement of an ingenious description is the substitution of a folding chain instead of a bar in the fan-light opener. By pulling a cord the

light is opened a desired distance, and becomes immovably fixed directly the grasp of the hand is released. Mr. Adams devised an easy mode of converting ordinary windows into reversible windows on the anti-accident principle. This was done by making a slit in the sash and sash-frame, into which metal tongues are slid, also pivoting the sashes centrally. The windows open as usual, the tongue hinders wind shaking, and checks draught when shut. To clean the

windows the tongues are withdrawn, and the sashes can then be reversed. An improvement lately made in regard to the use of metal tongues in the reversible windows is that they can be so made that the turn of a key releases the window for reversing, and obviates the trouble of removing the tongues. Among other things shown are the Norton check-door and spring and the panic door, for securing immediate means of exit in case of fire in public or other buildings.

## ART PLATES FROM "THE ARCHITECT."

Proof Impressions of the following Illustrations which have appeared in "THE ARCHITECT" can now be obtained in a separate form suitable for Framing:—

### The History of Art.

In Two Plates, reproduced from the Splendid Painting around Cupola, in Place St.-George's, Paris.

BY M. FRANCOIS EHRMANN.

Showing Typical Figures of Ancient and Modern Styles of Art.

Size, Thirty-six Inches by Fourteen Inches.

Price One Shilling each; by post, carefully packed inside patent roller, One Shilling and Threepence each.

May be obtained from all Newsagents or Booksellers, or from the

Publishers, GILBERT WOOD & CO., 175 Strand, London, W.C.

*Broughton & Co.*

Messrs. BROUGHTON & CO., 169 Queen Victoria Street, E.C., show their patent Chelsea mortise and other locks. The Chelsea patent reversible centre-bit mortise lock is a great improvement on the old-fashioned door-locks of cumbrous manufacture, and is superior even to later and better class locks. The advantages

claimed for it are that a mortise can be cut in a door and the lock inserted and fixed in five minutes, and that the mortise is cut with a centre-bit and without knocking the door about with mallet and chisel. The sinking for the striking-plate can be cut in a similar manner with the same bit. The mortise required for the lock does not injure the door. One screw only is required to fix the lock in the door, and

the lock can be withdrawn from the door instantly by simply unscrewing this fixing screw, which pulls the lock out with it. This renders it easy to remove the lock for painting the door, or for oiling or repairs to the lock itself, and its removal does not injure the door in the least, as no lever is required to prize it out. Also the furniture roses can be securely fixed by screws which go nearly through the door, and by the side of the barrel of the lock. With the ordinary mortise lock the furniture roses can only be secured by screws which pass a short distance into the wood, and if, as often happens, the screws are a little too long, their points come against the lock before they are fully screwed home, and an extra turn of the screwdriver strips the thread in the wood, rendering the screws useless. For this reason that class of furniture in which the knob is attached to the rose has been found unsatisfactory, particularly with thin doors. With this lock all objection of the kind disappears. Without enumerating all the advantages of the lock, it will be sufficient to note that it is substantially made of the best materials, and with the best workmanship, and the greatest care is taken in its manufacture to insure its accurate working and durability.

*Phillips's Patent Lock-jaw Tile Company.*

Mr. CHARLES D. PHILLIPS, patentee of the lock-jaw roofing tiles, Emlyn Works, Newport, Mon., occupies Stands No. 93, Avenue B, and 94, Avenue C. He shows the same class of roof as he exhibited last year at the Agricultural Hall, being a sample of a weatherproof roof, impervious to wind, rain, and snow. The lock-jaw principle will be seen to be that each tile locks into its four neighbours respectively, on sides, top and bottom, by means of a system of grooves, with corresponding tenons, on each of the four sides of the individual tiles. Half tiles are made similar to the above in every respect, and lock in the same manner, so that in every alternate course a half tile is used, which forms a "break-joint" throughout the roof. These half tiles are of two sorts, the single grip and the double grip, the latter, as its name implies,

having a double grip, with two grooves and two tenon joints instead of single ones. The single grip makes a notably light roof, weighing 600 lbs. per square of roofing. The double grip is heavier, and more suited by its massive appearance for mansions, &c., weighing 800 lbs. per square. An alluvial plastic clay is used for the manufacture, and in the process the pores of the clay are effectually closed by pressure of

SINGLE GRIP.

SECTION OF GRIP.

DOUBLE GRIP

SECTION OF GRIP.

heavy weight; the clay thus acquires density of texture, and a beautifully smooth surface. The preparation and after manipulation of the clay are matters of primary importance. In many ways these roofing tiles have the advantage over slates or ordinary tiles, and a point worth notice is that the roofing tiles are admirably adapted for use on iron roofs. In addition to the tiles themselves all accessories for finishing the roofing in character can be obtained from the firm, such as ridge tiles of varied design, weather-boards and finials, both plain and ornamental, and shields or apex for the centre.

*Chambers, Monnery & Co.*

Messrs. CHAMBERS, MONNERY & CO., of 41 Bishopsgate Street Without, E.C., have arranged a large and varied exhibit of general builders' ironmongery, well worth a close examination. The firm have a reputation for their productions, and during the past twelve months they have been exceedingly busy in meeting the numerous wants of their *clientèle*, and as yet the press of business shows no signs of slackening. Attention must be called to a new range.

Monnery's Patent Cast Wall Ties.

Monnery's Patent Cast Wall Ties (Turned down points).

The "Fawcett" range is a self-setting range with close fire, a serviceable and efficient range that is likely to become a favourite. It is compact, well arranged, and economic of heat, that is not let run to waste before doing good duty. The useful kitchenette, the improved cottage range, appears among the exhibits, being an open fire-range having the advantages of a kitchener. The oven is large considering the

dimensions of the range, and the flues are all arranged so as to utilise the heat to the utmost. The firm have several new pattern registers—tile, slow combustion, &c.—which are sure to find favour. The wall-ties for bonding hollow walls made by the firm are well known. At the Health Exhibition last year they took a bronze medal award. Among other things noticeable are the assortments of fancy wood and polished brass furniture for doors—entrance doors as well as internal ones. It is understood that a new departure is being taken by Messrs. Chambers, Monnery & Co. in plumber's goods, the price-list for which compares very favourably with other lists in the market.

*Attwood & Co.*

Messrs. A. ATTWOOD & CO. (late Salmon, Barnes & Co.), of Ulverston and 20 Bucklersbury, London, E.C., exhibit at Stand 16, Avenue A, their well-known revolving shutters and divisions, worked by patent balance motion, patent A B C self-sustaining lifts, model of hydraulic passenger lift, and patent revolving and expanding shop front guards or grilles. The secret of the success obtained by this firm in the manufacture of revolving shutters lies in the patent balance motion. This motion insures the shutter a long life and absolute freedom from drag on the roller or working parts, so destructive and prevalent in the working of shutters manufactured by other firms. These shutters are now being largely adopted for use in schools, colleges, chapels, halls, &c., as divisions, with very successful results. Their patent A B C self-sustaining lifts are adapted for all purposes, and may be driven by gas or steam-engine, or worked by hand-power. These lifts possess some entirely new features. They require no hand-brake; the cage cannot possibly run down by overloading or mismanagement, and are therefore unusually safe, no matter how inexperienced the individual may be who is working them. The gearing is complete on one base plate, and easily fixed and adjusted. There are no complicated parts difficult to get at or regulate, all being of the most simple construction and easy of access. The

automatic brake-wheel is so arranged as to increase its grip with increase of load, and however rapidly the lift is worked there are no shocks or jerks in its travel. The next we notice is a model of an improved hydraulic, direct-acting balanced lift. This is shown as worked from an accumulator contained in the plinth or case on which the lift is placed. The cage and ram are balanced by hydraulic pressure; automatic stops are applied to the starting-chain, so that the lift stops itself at top and bottom, and the valve arrangements are so designed and adjusted as to give the most perfect control over the movement of the cage. The model of patent revolving and expanding grille or guards for shop windows, doorways, &c., explains itself, but we think a description of their construction may not be uninteresting to our readers. They are various forms of iron openwork protections arranged either to coil on rollers like revolving shutters, in conjunction with their patent motion, or to expand and contract somewhat on the lazy tongs principle. This form of protection to shop windows, &c., is coming largely into vogue, especially in large towns, where a certain amount of police supervision is necessary when the premises are locked up for the night.

*Kite & Co.*

Messrs. KITE & CO., of Christopher Works, Chalton Street, London, N.W., exhibit their well-known roof and other ventilators. A turret ventilator of new design will commend itself to architects by its very moderate price and adaptability for use on exposed parts of buildings, where its appearance would certainly not detract from the general effect. They also show models of ventilators which can be put together in parts, and be placed in towers, &c., of buildings already erected or in course of construction. In cases where there are no towers or turrets, Messrs. Kite supply their various kinds of plain and ornamental ridge ventilators, or a special form of their patent, which is made to fit in with the pitch of roof, and does not appear above the ridge line. This firm are constantly adding to their already large assortment of patterns, and are prepared to follow out any

Publishers, GILBERT WOOD & CO., 175 Strand, London, W.C.

designs suggested by their clients, at little extra expense, to bring their ventilators, where applied, in conformity with the architecture of the building. With respect to interior ventilation—private rooms, &c.—their chimney-breast ventilator is so generally known that a description is unnecessary, but the ingenious method

Nº 4.

which they show of using ornamental items, such as brackets, mirrors, hanging cabinets, &c., as mediums for introducing fresh air into rooms, must commend itself to most householders who dislike the appearance of the familiar Tobin's tube. Their drain ventilators, for which a silver medal was awarded at the Health Exhibition, are in very general use by municipal authorities, who have been improving their system of drain ventilation during the last few years, such as Brighton, Torquay, Hastings, Burton, &c., and recently by the School Board for London, their price, as well as their efficiency, being a great recommendation. Messrs. Kite obtained the highest award, viz., gold medal for exhaust ventilators at the Health Exhibition, after practical test, and they

claim that their ventilators, comparing the amount of ventilating way given, are the cheapest of any in use. This firm are at present engaged on ventilating work for Ilkley Hospital, West Bromwich Institute, Hinckley Board School, and several public buildings in Ireland and elsewhere, and have in hand contracts for the London Tramways Company's stables, and various Government departments.

### FLORAL HALL EXHIBITION.

THIS Exhibition of Architectural and Building Trades closed on Saturday evening, after remaining open the whole of the week, and in the following remarks we close our notices of the exhibits shown at the Floral Hall:—

#### Burke & Co.

Messrs. BURKE & Co., 17 Newman Street, W., showed some exquisite decorative work by application of their marble mosaic, Venetian mosaic, and marble for floor and wall dados, wall-lining, and floors. Also figured mosaics, marble balustrades, columns, vases, dados, wall-lining, &c.

In describing the exhibits of Messrs. Burke & Co., it may be remarked that visitors to the Health Exhibition will remember the beautiful mosaic representing "Justice," which was made expressly to show at that exhibition. It formed a striking object at Messrs. Burke & Co.'s stand at the Floral Hall. All the tints and all the shades of tints in the composition are of different marbles. Among the magnificent marble dados shown was a rouge royal, with alabaster panel, double moulded top; specimen of a dado for the Hotel Métropole, Charing Cross, the execution of which was begun on March 6. A specimen column for the same hotel was also shown. A specimen was shown of the beautiful marble griote dado lately executed at St. Marylebone parish church, a most effective and massive work in marble. The rouge royal columns in front of this, 10 feet in height, are also the work of Messrs. Burke. Among other specimens was a rouge royal dado, with plain moulded cornice

of Belgian black marble and skirting of fossil marble; an Egyptian granite, with mouldings and base of Belgian black marble; Italian griote, grand antique base with moulding, and grand antique top moulded; also Devonshire marbles, with mouldings and base, &c., of Levant, vert, and Siena; specimens of marble balustrade pilasters, &c., and specimen of balustrade of the grand staircase at the Holborn Restaurant. The exhibits at this stand were particularly rich and deserving of attention.

#### Phillips's Patent Lock-Jaw Tile Company.

At Stand No. 72 this company showed a structure the roof and walls of which were covered with the patent lock-jaw tiles. Mr. CHARLES D. PHILLIPS, M.I.M.E., the patentee, Emlyn Works, Newport, Mon., by invitation read a paper on Wednesday afternoon (March 4) on the subject of "Clay Ware," with special reference to the exhibit at his stand, in which he mentioned that the patent roofing tiles had been for three years successfully in the market, and he was convinced that their merits required only to be more widely known to insure their immediate and universal adoption both at home and abroad. The object of the invention is the production of a roofing tile that will form a perfectly weather-resisting roof and be impervious to wind, rain, or snow, while combining all that is necessary for an efficient roof, economical and ornamental. Thus on each of the four sides of the tile a system of grooves with corresponding tenons is formed, so that each tile locks into others on each side, top and bottom; and the invention has the novelty of the bottom tile butting against or locking into its corresponding lower one. Arrangements have been made with the proprietors of seven works in different parts of the country for the manufacture of the tiles during this year to the extent of a million, which is about the quantity sold at the present day. Considering the tests these tiles have undergone, and their success where used, Mr. Phillips is warranted in considering that wherever their merits become known they will be used.

## SIXTH ANNUAL BUILDING TRADES EXHIBITION, AGRICULTURAL HALL, ISLINGTON, N., STAND 10.—MARCH 16 TO 28.

Awarded a DIPLOMA at the FISHERIES, 1883; also the SILVER MEDAL at the HEALTHIERIES EXHIBITION, 1884

# TWO MILES

OF

# THE "VICTORIA" DRY GLAZING!

ONE YARD WIDE.

Messrs. DEARDS have been favoured with the order from Mr. J. C. HUMPHREYS to GLAZE the **NEW BUILDINGS AT THE INVENTIONS EXHIBITION, 1885,** At SOUTH KENSINGTON, with their Patent "VICTORIA" DRY GLAZING. About 50 Tons of Glass will be used for the purpose, 30,000 Feet super.

MESSRS. DEARDS have also just erected **ONE LARGE CONSERVATORY** 100 feet long and 22 feet wide, requiring 5,000 feet of Glass, for Messrs. ELSDON & CO., Cambridge.

Also Re-glazed the "ROYAL EXOTIC NURSERY," South Kensington, for Messrs. WILLS & SEGAR, the Roof of which had been leaking for years, and is now made perfectly watertight by the Patent "Victoria" Dry Glazing.

And they are now erecting **A LARGE PEACH-HOUSE** for Madame ADELINA PATTI, Craig-y-nos Castle, South Wales, 100 feet long, besides numerous other Orders.

Orders for the "Victoria" Dry Glazing have been executed for:—

Sir H. J. SELWIN-IBBETSON, Bart., M.P.,  
Down Hall, Harlow.  
Major TAIT, Epping.  
W. F. MASTERS, Esq., Brixton.  
Rev. ALBERT DEARN, Burgess Hill.  
Mr. T. SELBY, Victoria Street, Westminster.

G. R. HUNT, Esq., Hornsey.  
Major HORROCKS, Paddock Wood.  
Messrs. GURTEEN & SONS, Haverhill.  
Mrs. MONTEFIORE, Worth Park, Sussex.  
S. CHISENHALE-MARSH, Esq., Epping.  
CHAS. EDE, Esq., Guildford.

Sir HOWARD ELPHINSTONE, Bagshot.  
Mr. J. BERRYMAN, Redhill.  
C. W. F. GLYN, Esq., Durrington House, Sheering.  
The Council of Health Exhibition—All the GLASS CASES for the FANCY COSTUMES.  
Mr. MAYAL, Studio, Park Lane, W. &c., &c.

Also 6,000 Feet at the FISHERIES and the HEALTH EXHIBITIONS.

The "Victoria" Dry Glazing Works, Messrs. DEARDS, HARLOW, Essex.

*C. Kite & Co.*

Messrs. C. KITE & CO., Christopher Works, Chalton Street, N.W., showed at their stand a model house, by means of which visitors were able to see the practical working of the ventilators made by the firm, as applied to ordinary dwelling-houses, rooms, &c. Their patent exhaust roof ventilators are used, and found to promote thorough and efficient ventilation without draught in private houses, dwelling-rooms, offices, churches, schools, halls, &c. They are plain or ornamental, and fitted to ridge, lean-to, or flat roofs, or may be fitted into openings in the side of walls where the circumstances of any particular case renders connection with the roof impracticable. Their turret ventilators are of metal wholly, or of metal and wood, in varied designs, and also are made to fit into turrets of architects' own designs, whether of round, square, or polygonal forms. The chimney-breast ventilators, wall inlet ventilators, along with their practical merit are unattended with the objection that they produce an unsightly appearance, as they can be disguised by any ornament that has a place in the room, for instance, by mirrors, hanging cabinets for old china, &c. The drain ventilators must also be mentioned as most useful appliances, most efficient and inexpensive, including the induced current outlet ventilators and down-cast inlets. The practical working of all these appliances could be seen by model apparatus. It will be remembered, too, that Messrs. C. Kite & Co. received the highest award, a gold medal, at the Health Exhibition for their induced current ventilators, and a silver medal for drain ventilators.

*John Grundy.*

Mr. JOHN GRUNDY, of 30 Duncan Terrace, City Road, N., showed his patent warm air ventilating firegrate, which has proved so successful and such a favourite among his customers. While the heating surface is greater than that of other firegrates, the chimney is used for a considerable distance as a hot-air chamber for diffusing heat. Thus,

with great success, it has been applied to churches, chapels, schools, and other buildings. Durability, safety, and simplicity are combined in the patent. Applied to churches, it not only diffuses warmth throughout the building in cold weather, but in summer time the apparatus becomes the means of introducing cool air into the church.

*Hayward Bros. & Eckstein.*

Messrs. HAYWARD BROS. & ECKSTEIN, of Union Street, Borough, S.E., were well represented. On Friday (the last day but one of the exhibition) a new coal-plate, patented the previous day, was exhibited for the first time. The patent self-locking coal-plate is, as its name implies, self-locking, and locks itself when dropped in its place just as easily as the front door of the house latches itself when pulled to in leaving the house. The contrivance is as simple as it is effective. From the inside of the cellar it can be set free by little more than touching it; but there is no possibility of moving or opening it from above. An explanatory description of the patent will be given next week in the notice of exhibits of this firm at the Agricultural Hall. The great power possessed by Hayward's patent semi-prism pavement lights, for throwing the light into remote corners where otherwise no light could penetrate, was ingeniously shown. A specimen was shown of Hayward's improved circular iron staircases, tread, riser, and spandrel in one, &c.

*Pictor & Sons.*

Messrs. PICTOR & SONS, of the Bath Free-stone Works, Box, showed a good variety of Bath stone from their quarries, or mines, as these quarries may be called, for, with the exception of one quarry, the stone is worked from underground, oil lamps being used now in the workings instead of candles, as used to be the case. As a weather stone Box ground will yield to none, and a standing proof of its qualities may be seen in the church at Box, built in the thirteenth century. Messrs. Pictor & Sons showed, at their Stand, No. 65, 12-inch cube

specimen samples of Box ground, Stoke ground, Corsham Down, and Farleigh Down stone. The purpose and position for which the stone is to be used would determine the particular kind, in view of endurance, economy in working, suitability for carving, &c. Samples of stone tracery, and a section of fluted column with carved cap, were also shown. Many other specimens served to show the adaptability of the stones for general use.

*James Stiff & Sons.*

Messrs. JAMES STIFF & SONS, London Pottery, Lambeth, showed an excellent collection of architectural terra-cotta in buff and red, including a specimen of a capital and column which has been carried out, showing good work deeply undercut; also medallions, cornices, mouldings, terminals, ornamental balusters, string courses, spandrels, execution and design especially noteworthy in all. Among sanitary ware shown was the Weatherby disconnector trap improved. All syphons and seals being outside the case of the trap allow of access for removal of any grease. This apparatus is now made with an air-tight cover for fixing indoors, arranged with valve which excludes all gas. The interceptor sewer-air trap which effectually prevents any sewer-gas from drains entering the house, and is so arranged as to cause a minimum of contamination to the outer or surrounding air. Drain-pipes, with connecting bends, junctions and gully traps, kitchen and hospital sinks, patent drain disinfectors, patent drain inspection shafts, air bricks, ventilating damp-proof courses, &c., were among the exhibits shown. The Weatherby registered up-draught louvre cowl must also be mentioned. The firm have completed four large groups of statuary for the Government at Calcutta, and photographs of these gave a good idea of the meritorious work produced by this firm.

*F. Rosher & Co.*

Messrs. ROSHER & CO., of Upper Ground Street, Blackfriars, showed selections of architectural decorations, garden decorations and ornamental appliances, &c., in artificial stone.

# THE GREAT PROBLEM OF THE XIX<sup>TH</sup> CENTURY. VENTILATION WITHOUT DRAUGHT.

The hitherto unsolved problem of "Ventilation Without Draught" is to be seen practically illustrated at FREDERICK HENRY SMITH'S Test Room, No. 68, 52 Queen Victoria Street, E.C., Patentee of the Automatic Siphonic Aspirator System of Ventilation. A personal inspection invited.

*Extract from the Annual Report of the "French Hospital and Dispensary," issued 29th January, 1885.*

We have also to return our best thanks to Mr. Smith, who undertook gratuitously to repaint one of our wards and to apply a new system of ventilation of his own invention, which was very successful.

*Letter from David Urquhart, Assistant Engineer to Colonel Sir Francis Bolton, C.E.*

F. H. SMITH, ESQ., 52 QUEEN VICTORIA STREET, E.C.

4 THE SANCTUARY, S.W., LONDON: NOVEMBER 22nd, 1884.

In reply to your inquiry, I have much pleasure in certifying that your system of ventilation as applied to the "Island Room" of the illuminated fountains at the Health Exhibition reduced the temperature during the displays from about 110 deg. to about 70 deg., and thus enabled the men to perform their duties without inconvenience.—Yours faithfully,

DAVID URQUHART.

*Extract from H. C. Bartlett's, Esq., Ph.D., F.C.S., Report of 20th October, 1884.*

In contrast to these experiences of the effects of the method of ventilation adopted in the "Island Room," I may mention that on June the 4th I was instructed to report on the condition of the "Island Room" while the men were engaged in playing the illuminated fountains. I found the external air 54 deg., that of the room before it was shut up 56 deg., and a clinical thermometer, graduated to 115 deg., burst in its case, while the suspended thermometer registered no less than 127 deg. Fahrenheit. The atmosphere of the room was indescribably fetid and oppressive, and the attendants complained that they were exhausted and rendered unfit for further exertion after twenty minutes' work in that highly injurious condition of the air produced by the accumulation of carbonic acid. This is not to be wondered at when we reckon that each man expires from the lungs and skin three-fourths of a cubic foot of carbonic acid per hour, and the five arc lights each give off more than double that of a man; so that, in the unventilated condition, there was, at the end of half an hour, 15 feet of carbonic acid in addition to the possible half-foot the air of the room naturally contained, an accumulation of thirty times the largest permissible proportion of this dangerous contaminating gas.—I am, faithfully yours,

H. C. BARTLETT, PH.D., F.C.S.

prepared by the process known as Bennett's stent indurating process. Specimens also of their red and white Suffolk bricks and facing bricks, dark and bright; red moulded bricks, imths, splays, jambs, beads and labels, various ring courses, dentil, cable and leaf red pings, moulded coping and arch bricks, chimney pots, plain and special ridges, ornamental finials, &c. Among other matters the firm showed Messrs. Phillips's patent lock-jaw roofing tiles, as manufactured under license by Messrs. F. Rosher & Co.

#### Thomas Lawrence & Son.

Messrs. THOMAS LAWRENCE & SON, of Becknell, Berks, made a thoroughly effective display of happy results obtained by the employment of their red rubber and facing bricks, in the erection of a carved and moulded red brick arch doorway fitted with a handsome English oak door and frame as their exhibit. Completed by side and back walls, the structure as a whole showed the application of their iron-ry bricks, red wall tiles, &c. The rubber brick takes a remarkably sharp and clean finish, and nothing more could be desired in the way of sharp and clean outline in mouldings and arving. The material is most workable, and is cut with ease by a knife, and may even be rubbed away with the finger. This is an advantage that is not attended with bad results, because the material hardens with exposure, so that soon renders the work durable and lasting. The bricks, &c., have been extensively used in London and in the provinces with happiest results. It may be mentioned as regards the arch doorway that Messrs. Cubitt, of Gray's Inn Road, put up the work for Messrs. Lawrence & Son. No small amount of effect is imparted to the general appearance by the neatness of the courses, laid with a white putty joint with run line.

#### Norton Door-check Co.

THE NORTON DOOR-CHECK AND SPRING COMPANY, of 46 Holborn Viaduct, showed doors fitted with this check, an ingenious apparatus, which is fixed to the upper part of the door and frame over. The apparatus comprises a cylinder, piston, spring, and self-adjusting valve, which react on each other. The power is derived from the spring, the check from the piston cushioned on air, so that the door is surely closed and latched, though noiselessly. A gold medal was awarded at the Health Exhibition to this door-check.

#### John Matthews.

Mr. JOHN MATTHEWS, Royal Pottery, Weston-super-Mare, manufacturer of terra-cotta statuary, fountains, vases, &c., ornamental and plain wares for gardens, conservatories, &c., showed a collection of Poole's patent bonding roll roofing tiles. A small structure erected showed a roof covered with the patent tiles. The superiority of the tile consists in its bonding principle, and the advantages are strength, lightness, and security against rain-drifting and wind-stripping. The weight is given as one thousand tiles to four tons, covering eleven squares of ninety tiles to the square; weight per square, 7½ cwt.

#### J. A. Somerset.

At Stand 78, Mr. J. A. SOMERSET, of Newcastle-on-Tyne, showed for the patentee, Mr. Geo. Connell, of the same city, his mode of ventilation without draught, by bringing fresh air from the outer atmosphere, warming it by means of gas jets, and discharging it into the apartment pure and warm. The aid of diagrams is required to thoroughly explain the plan carried out, which differs somewhat from other modes now in use where gas is used. It may be adopted either by means of a shaft built in with the wall, by an independent shaft in or against the wall of the room, or the windows, by making them double, can be utilised in the same manner. In all cases the products of the gas are carried into the outer atmosphere, and an ingenious arrangement for preventing a back draught is adopted, which we think should be successful. In addition to the ventilating appliances, an ingenious "combination" dormer window was shown, that, being made of cast iron, can be fitted in three different positions—namely, projecting with flat roof, ditto with gable, or recessed in the slope of the general roof. By its use plastering

is dispensed with; it can be produced at from 30 to 50 per cent. less than an ordinary "dormer," and a great saving of time is effected in its erection. We may probably refer to these inventions more fully when illustrations are obtainable.

#### W. & R. Leggott.

Messrs. W. & R. LEGGOTT, general brass-founders, 70 Park Road, Bradford, showed their patent adjustments for opening and closing fanlights, skylights, ventilators. This most useful and efficient apparatus has given great satisfaction, and is spoken highly of by professional men of note among old and esteemed subscribers of this journal. Perfect ease and noiselessness of action is united with great simplicity and durability. It is self-locking, and remains fixed at any desired angle. They are capable of lifting a weight equal to 2 cwt., and also answer well in exposed situations where strong winds do not cause them to move or rattle. Pleasing examples of plain and ornamental metal-work were to be seen among the exhibits at this stand. In the show of fireplace furniture was an elaborately designed and executed pair of firedogs, with honeysuckle ornament conventionalised, and an especially neat fender, with machine-cut brass rail and polished black moulded base; also highly-wrought metal-work of floral pattern.

#### Ewart & Son.

Messrs. EWART & SON, 346 Euston Road, showed their various baths, water-heaters, ventilators, and smoke curers; also window conservatories and ornamental zincwork. The "Califont," a new water-heater, with special merits, was also shown. The advantages are—the parts separate for cleaning, so that if the boiler becomes foul from use or overpressure of gas, or any part gets by chance damaged, the whole can be taken apart, examined, cleaned, repaired without skilled labour and without going to the makers; also the burner swings outside for lighting, and thus avoids risks of explosion from confined gas; and also the joints are loosely fitted, rivetted, or seamed. No solder is used, so that the apparatus would not be melted if the gas were lighted before or left on after the water is running. The No. 4 quality warms three gallons of water per minute 60 deg. to 90 deg., that is to say, provides a warm bath of thirty gallons in ten minutes.

#### Engert & Rolfe.

Messrs. ENGERT & ROLFE, of Barchester Street, Poplar, E., showed their valuable specialities in roofing and other felts; and also brick work set in a cistern of water, illustrating the mode of application and the utility of fibrous asphalt as an anti-damp course in walls. The roofing-felts are of various kinds for a lining to be placed under the roof slates, and for covering the outside of roofs. It may also be used under iron roofs, and is invaluable as being impervious to wet as well as non-conducting.

#### Chambers, Monnery & Co.

Messrs. CHAMBERS, MONNERY & CO., 41 Bishopsgate St. Without, showed various stoves and ranges and general builders' ironmongery, and also their patent wall-ties for hollow walls, and an improved wall-tie arranged so that one tie grips two courses of brick. An admirable kitchener was also shown among others. This is a strong, improved, self-acting and self-setting kitchenette, with wrought bars and brick backs, combining the advantages of a kitchener and an open fire range—a most useful apparatus, cleanly in action trouble and time-saving.

#### Archibald Smith & Stevens.

Messrs. ARCHIBALD SMITH & STEVENS, of the Janus Works, Queen's Road, Battersea, manufacturers of the patent low-pressure suspended hydraulic lifts and the complete self-sustaining dinner lifts, double as well as single, showed a most serviceable lift at the Floral Hall, which had not been previously exhibited. This lift, Stevens & Major's patent self-sustaining lift for 2 cwt., has the gearing arranged to sustain the load in lifts of double form or single, by a brake which comes automatically into operation upon release of the hand-rope, but leaves the lift free as long as the hand-rope is pulled. A special arrangement for quick

lowering by the brake is provided. As in the other patent lifts of this firm, the grip of the brake increases directly with the load. Also was shown Stevens & Major's patent hydraulic door-spring and check, by which, when fitted to a double-action or swing door, the door is silently and steadily closed with or against the wind without slamming. Also the same fitted to a single-action door closing against a rebate. This apparatus is a hinge as well as a spring, and therefore no other hinges are required. It is fixed beneath the floor, and a carpet may cover it. There is no unsightly projection of apparatus, and nothing to distinguish it from an ordinary door. The moving parts work in oil, and thus are always sufficiently lubricated, and wear and tear reduced to a minimum. Nothing more perishable than metal is employed, no leather valves, &c. The closing action is very slow, giving time to pass through, and the rate of closing can be adjusted by any unskilled person. It is silent in action and inexpensive. The spring contains improvements not before exhibited.

#### D. Ap Lloyd.

An effective stand was arranged and exhibited by Mr. LLOYD, of 43 New Oxford Street, W., consisting of specimens of effective artistic wood mantelpieces and over-mantels, tastefully decorated in Adams's and other styles, and possessing the great merit of being very inexpensive. There were also some over-doors to match, pedestals for busts, &c., and some specimens of marble mosaic for halls, &c.

#### Lincrusta-Walton.

Messrs. F. WALTON & CO. contributed some good examples of their Sunbury wall decoration, consisting of three sections of wall and a door, all handsomely decorated in gold and delicate shades of colour. The door was specially worthy of attention, being elaborately adorned with mouldings and enrichments in lincrusta of remarkable sharpness and decision.

#### James Pulham & Son.

Messrs. JAMES PULHAM & SON, of the Terra-cotta Works, Broxbourne and Brixton, had a section in model of a dome they are preparing for the Inventions Exhibition, to show the mode of constructing a large or small dome with dome-building blocks; also were shown some full-sized dome-building blocks. The blocks are constructed to joggle themselves, so that the dome can be built without centreing. The inner and outer shell of the dome are bonded with dowels, and the haunches may be filled in with concrete. If desirable to carry up a staircase within the thickness of the domical roof, arrangements can be made for the purpose. Besides the outer abutment to carry the dome, an ornamental feature, giving extra support, may be introduced in the shape of an interior circular colonnade, the circumference of which would correspond nearly with that of the interior ring of the dome, and so add support to the inner shell. A panel of a fire-resisting door, which is being prepared to show at the Inventions Exhibition, was on view. The complete door will consist of three panels, made of the most fire-resisting clay produced. These are joined together by a special cement, and further consolidated by, so to speak, an iron framework, as provision is made for iron rods to pass through and bond all the panels. As the iron is a full inch inside the door everywhere, fire cannot touch or affect the metal part of the work. The doors may be used as swing or sliding doors, double or single, and hung so as to close by their own weight. Specimens of balustrading instanced the sharpness and truth of execution that the terra-cotta is capable of receiving; it showed no flash of fire, and in appearance was equal to any cut stone. Specimens of work done for the late Mr. Street, R.A., were shown, and samples illustrating the difference between the relieved and unrelieved work. Two capitals, side by side, were a striking instance. The hand-modelled ornamental work was effective, varied, red modelled on buff, and *vice versa*, &c., all sharp and true in execution. Terra-cotta balusters, bluish, to match Irish limestone; spar wall facing, a stone-like concrete; and red and stone-coloured concrete, among many other interesting samples, were to be seen. A weathered block shown had no signs of failure or decay.

# "THE PEDESTAL VASE," JENNINGS' IMPROVED W.C. APPARATUS

(Combination Urinal and Slop Sink).

Registered No. 16,300.

A PORCELAIN VASE set on a tiled or mosaic floor, within walls or a dado of glazed tiles. The usual wood framing, forming a storehouse for the retention and accumulation of *damp*, *dirt*, and *disease germs*, with the joints, crevices, and imperfections in work which the closet enclosure so often conceals, is entirely abolished. The seat is hinged, permitting free access for use as a *slop sink* or *urinal*, and for cleansing, so that the entire apparatus and space can be freely washed down. For this latter purpose the floor should be slightly sunk, and laid to fall to a grating, with waste carried through the external wall, and terminating in a copper flap valve to prevent draught.

The suggestions as regards wall linings and floor, may, of course, be modified as best adapted to the building in which the closets are used; and in the consideration of such details, alternative schemes will readily present themselves.

At the recent **HEALTH EXHIBITION** (South Kensington, 1884), amongst a series of official tests, under the supervision of Baldwin Latham, Esq., C.E., and the Jury No. 9, Class XXIII., and successfully withstood by this closet, the following may be cited in evidence of its efficient action. Being fixed in position shown in illustration, with "**JENNINGS' PATENT SINGLE FLUSH WASTE-PREVENTING SYPHON CISTERN**" 5 feet over, with  $1\frac{1}{2}$  inch down-pipe, ten apples (averaging  $1\frac{1}{4}$  inch diameter) and a flat sponge about  $4\frac{1}{2}$  inch diameter were thrown into the basin. The water, as well as the whole of the exposed or dry surface, was first blackened with plumber's "smudge," and the sides covered by four pieces of thin sanitary paper, which adhered closely to the soiled surface. The handle of the cistern was then pulled, and the two-gallon flush liberated. After seven seconds (the time occupied by the discharge), a receiver placed under the trap outlet was removed, containing in the blackened water the ten apples, the sponge, and the four pieces of paper, no traces of the soil remaining visible upon any part of the apparatus.

**GOLD MEDAL AWARDED.**

THESE CLOSETS are already in use in Hospitals, Banks, Hotels, Offices, Private Residences, &c., with most satisfactory results, and, fixed in the manner described, in appearance and action leave nothing to be desired. By the novel arrangement of the supply to Basin, as shown in the sectional sketch annexed, the whole surface is well flushed and cleansed, whilst the bottom of Basin and Trap are thoroughly scoured by a concentrated rush of water which insures the instantaneous removal of the contents, thus overcoming the inherent defects in the many imitations recently produced of "**JENNINGS' MONKEY-CLOSET**" (the original form of wash-out watercloset), which was invented and patented by G. J. in 1852.

**GEORGE JENNINGS,**  
SANITARY ENGINEER, STANGATE, LONDON, S.E.  
A VISIT TO THE SHOWROOMS IS RESPECTFULLY REQUESTED.

**EASTWOOD & CO. (LIMITED).**  
LIME, CEMENT, AND BRICK MANUFACTURERS.

**SHOEBURY, COWLEY, & KENT BRICKS IN ANY QUANTITY DELIVERED ALONGSIDE.**  
Shoebury Malm Facings and Paviers | Dutch, Adamantine, and Red English | Laths, Plaster. Lathing in the best style. | Ridge Tiles, Terminals, &c.  
Stourbridge, Welsh, and Newcastle | Clinkers. | Moulded Bricks of all kinds. | Staffordshire Blue Bricks.  
Fire Bricks, &c. | Red and White Suffolk Bricks. | Red, White, and Black Rubbers. | Chimney Pots, Slates.  
Glazed and other Drain Pipes. | Greystone, Blue Lias, and Chalk Lime. | Broseley and Yorkshire Roofing Tiles. | Hair, Sand, &c. &c.

**PORTLAND CEMENT**

(WELLINGTON BRAND) of Unsurpassed Quality.

Sole London Consignees of Messrs. Gibbs & Co.'s (West Thurrock) **PORTLAND CEMENT**, and the **LUMLEY GLAZED BRICKS**.

R. A. ALLEN & Sons well known Red and White Suffolk Bricks, and the Chemical Paper Company's (Limited) Water Damp, Wind, & Dust Proof Paper.  
**BRICKFIELDS:—WEST DRAYTON, MIDDLESEX; SITTINGBOURNE, KENT.**

**WHARFS:—**

VICTORIA WHARF, MORTLAKE, S.W.  
BLACK HORSE LANE, RICHMOND; and  
LEA BRIDGE WHARF, CLAPTON.

**CASES FOR BINDING THE ARCHITECT.**

Price Two Shillings.—Office: 175 Strand, London, W.C.

# The Architect.

## THE WEEK.

ON Monday a meeting was held at the Office of Public Works, in Beresford Place, Dublin, to elect surveyors to represent the intending contractors in the taking out of the quantities for the new Science and Art Museum, of which Messrs. T. N. DEANE & SON are the architects. Messrs. GRIBBON & BUTLER were elected by a large majority, and as the working drawings are ready no time will be lost in preparing the bills of quantities. The contract is likely to amount to 100,000*l.*, and in the present state of the building trade a work of that amount is sure to secure many competitors. The Prince of WALES is to lay the foundation-stone on April 10, but the ceremony can be only formal.

THE Direction of the Musée de Cluny in Paris, which is so rich in examples of Mediæval archæology, has been confided to M. DARCEL, whose name is well known from his success as director of the tapestry works of the Gobelins. He will be succeeded at the latter by M. GERSPACH, chief of the bureau of National Manufactures. The appointment of M. DARCEL to the Thermes suggests that the collections are to be utilised for something more than antiquarian study.

SIR EDMUND BECKETT has at least one admirer, in the person of the Archbishop of YORK. A new church is about to be built in the Holmes, at Doncaster, and the foundation-stone was laid by Sir EDMUND himself, who appears to have gone through the ceremony without saying a word against architects, although he is the designer of the building. When it was his Grace's turn to speak, a very high admiration of Sir EDMUND was expressed. "Sir EDMUND BECKETT had not told those present," said the Archbishop, "that among his other accomplishments he possessed that of being a very eminent architect, and when the proposition was sportively made that he should undertake to be the architect, it was in a moment seriously embraced, and he was now in charge of that building as its architect. He ventured to foretell that that was a guarantee of its solidity, its beauty, and good taste. Sir EDMUND was not the man merely to draw a cheque for a large amount and hand it over to a committee, but he came to the work, he knew what needed to be done, and he took care that it was done. The church was already about paid for, so far as the building was concerned, and as Sir EDMUND was the architect one might very well rest satisfied that in due course a handsome church would arise." This shows a very satisfactory state of harmony—for we believe it does not always happen that a chancellor is a hero to his diocesan.

AT the present juncture it is impossible not to take interest in the long paper which Mr. H. G. PROUT, formerly a colonel on the staff of the Egyptian army, contributes to the *American Engineering News*. In 1875 Mr. PROUT was acting as chief of the geographical and topographical section in the General Staff Bureau at Cairo. He was ordered to join COLSTON's expedition to the Soudan, and to make a careful reconnaissance of the Suakim-Berber route, noticing particularly the water supply. He arrived in the harbour of Suakim in the last week of March, and on the 14th of April he reached Berber. The first difficulty in laying a line along the route is, he says, at about thirty-two miles from Suakim, where for some miles the pass is narrow and crooked and the gradient steep. Masonry would be required to protect the road-bed from the wash of the torrent, and possibly there may be trouble in getting practicable gradients without rock-cutting. According to Mr. PROUT, the defile is an extremely ugly one to cross in the face of an enemy. Then, after passing for nearly thirty miles through small valleys, the narrow pass between Wady Ahmed and Wady Haratree is reached. It is over 3,000 feet above the sea, and heavy cutting will be unavoidable unless another pass can be

found. The difficulties of the route vary, and at eighty-seven miles from Suakim is a winding pass which may be said to offer the last of them. Mr. PROUT maintains that for seventy-five miles from Suakim, at no one point could a force of 2,000 or 3,000 men with their animals find water for their needs. There are two absolutely waterless stretches, after leaving Bir Ariab, of fifty miles each. A large body of men must, then, carry three days' water, twenty days' food, at least fifteen days' forage, and a large amount of ammunition. But, in spite of the difficulties, Mr. PROUT reported to his chief that throughout far the greater part of the distance a railway can be constructed with unusual ease and economy. As to the cost, nothing is said. Iron ties must be used, as the white ants would destroy wooden ones. There is not an ounce of fuel to be had in the country. Surveys must be made as the line advances, involving costly mistakes and tedious delays. But when the road is built the Mahdi is "smashed," and the restoration of order in the Soudan would be quickly followed by profitable and growing commerce. The pipe line is considered impracticable without the railway. In no other way than by a railway can the machinery, pipe, and coal be carried. As the line advances the pipes must stand practically empty until the Nile is reached, and water pumped back.

THE Provincial Art Societies are securing a great many distinguished artists as members. At the election of honorary members of the Leeds Art Association, which was held this week, the following Academicians were selected, viz.: Sir F. LEIGHTON, P.R.A.; Mr. E. ARMITAGE, R.A.; Mr. W. P. FIRTH, R.A.; Mr. J. C. HORSLEY, R.A.; Mr. E. J. POYNTER, R.A.; and Mr. C. W. COPE, R.A. A good deal of prestige arises to a small society when painters of this class are willing to join it, and as it is almost a duty to foster local art, the President and the other Academicians are acting rightly in giving all the aid they can to the cause.

MONDAY, May 4, has been selected for the opening of the International Inventions Exhibition. Last year the Health Exhibition was opened on a Thursday. The first Monday in May is probably the more suitable day, although it is likely to diminish the number of visitors to the Royal Academy.

It is understood that in the upper official world there has been much dissatisfaction with the proceedings at the South Kensington Museum when Mr. MUNDELLA attended to distribute the prizes. Very few students had sufficient self-denial to visit the lecture-theatre, and the number was much diminished before the peroration of the address was reached. The prize-winners were not all in attendance. The speaker was heard with coldness, and at the close Mr. MUNDELLA left the platform rather abruptly. The indifference of the students to the oration has been interpreted as a slight to the Government, and we believe that some foolscap has been expended in the expression of the official annoyance. But a little reflection would have shown that the students were not to blame. Under the best of circumstances the distribution of prizes is not an enticing ceremony, for the addresses are all on one pattern, in which the late Prince Consort, the Exhibition of 1851, the bad taste of the public in days before the Department was constituted, and the danger of foreign competition are the elements. But on Wednesday in last week the distribution was put into competition—and we believe for the first time—with a soirée in the same building. Music and singing and pleasant conversation naturally became the more attractive. "Some one had blundered"; but the organisers of the soirée were not to blame. In other schools of art, when the distribution of prizes becomes the occasion for a soirée, there is not a general flight to witness the ceremony, and why should Mr. MUNDELLA pout when he finds that South Kensington does not differ from Notting-ham, and that young people are no more disposed to hang upon his words in the metropolis than in the provincial town? The affair shows a despotic spirit on the part of the Council, and we hope it will never be tolerated among art students.

## THE WESTMINSTER DIFFICULTY.

THE inquiry into Mr. PEARSON's proposals for dealing with the exterior of Westminster Hall still drags along. So much is said for and against the plans, and the witnesses on both sides are so well balanced, that the members of the Committee would be justified in complaining about the difficulty of their task. Unless they draw lots, there seems to be no way of arriving at a conclusion. But it was inevitable that every one, except the witnesses, should be puzzled in the case. The project is but an archaeological guess, and it seems a pity that so much time should be expended when it is known that, no matter how often they may meet, the Committee will be still in the dark about the original appearance of the building.

It is running a risk to seem to undervalue the efforts which Mr. SHAW-LEFEVRE has made to give a Mediæval character to the exterior of the Hall. But when we consider the kind of masonry that has been made visible, we must say that, with all our reverence for architectural relics, we can see no advantage in keeping the wall before the public as if it were a thing of beauty and a joy for ever. At Westminster the Houses of Parliament are of much more importance, architecturally and politically, than the Hall, and they should be allowed to dominate the position.

The document which we published last week appears to have been overlooked in the discussions on the proposed restoration, but it shows very plainly that from the first the late Sir CHARLES BARRY held an idea which is only partially realised in the existing buildings. In other words, his design has not yet been carried out. It will be seen that as far back as 1836 he proposed the enclosure of New Palace Yard in order to shut out an unfavourable view of Westminster Hall, and urged "that all the entire mass of building forming the Houses and adjuncts be treated in its architectural composition as a single edifice for the sake of unity, public character, and effect." Every one who has had the least experience in dealing with Parliamentary Committees is aware that it is often fatal to a scheme to disclose too much, and in interpreting BARRY's document we must read between the lines. In 1836 there were houses in Bridge Street, and the inconvenience of the Law Courts was not generally acknowledged; it was therefore prudent on the architect's part to secure the erection, in the first place, of the House of Lords and the House of Commons with the offices, and trust to time for the remainder.

In less than twenty years the opportunity arrived for a full explanation of his design. An application was made to the architect in 1853 by the Office of Works, and the reports which followed may be seen in our correspondence page. BARRY proposed, in the first place, that the north and west sides of New Palace Yard should be enclosed, in order that it might form a part of the New Palace as it did of the old, and he wished to have the public entrance where it should be—through an archway at the north-west corner of the quadrangle. St. Stephen's Porch, which is now the entrance, has a sounding name; but it is not in the position where one would expect to find it. It was well known that last year, when the designs for the New Government Offices had to be deposited there, cabmen and railway carriers, who are supposed to be omniscient as regards London, were not all clear as to the whereabouts of the porch. In the second place, BARRY proposed a connection between St. Stephen's Porch and the quadrangle. The exterior of Westminster Hall would be preserved in all its sacredness and gauntness by the arrangement; but it would be masked or enshrined by a range of buildings in keeping with the Houses of Parliament. As there was an open court between the Hall and the building, the masonry could be seen; but it might be safely assumed that a dozen pilgrims would never ask to look at the wall in the course of a year.

Mr. SHAW-LEFEVRE says that the buildings proposed by BARRY are unnecessary, and, if it were requisite to employ a number of expensive officials in order to utilise the rooms, there would be a strong objection against the proposal. But it has been generally supposed that the Government offices are cramped for space, and, unless we are mistaken, if buildings existed in that position they would be certain to be occupied without much loss of time.

It will be asked why Sir CHARLES BARRY's plans for the additions were not carried out when they were brought forward in 1854. Sir WILLIAM MOLESWORTH, who was at the time First Commissioner of Works, said that the buildings would be useful as extra committee-rooms and public offices. "Accommodation of this description is," he wrote, "frequently and suddenly wanted by this department, and, when suddenly wanted, can generally only be obtained by hiring ill-adapted private houses at an extravagant rent, upon which large sums of money must be expended to fit them for official use." Whether the Office of Works has to find accommodation of the kind of late days is best known to the officials. On the score of convenience, it was plain that the buildings would then be an advantage, and whatever may be the capabilities of the existing offices, there are always probabilities of a demand for extra space.

Sir WILLIAM MOLESWORTH, in his recommendation, was not over zealous; for while he reports that the works would "greatly improve the appearance and design of the New Palace, would afford valuable and much-needed accommodation, and ought to be executed if Parliament would consent to vote the requisite funds," he winds up by saying, "but they are not in my opinion indispensable for the completion of the New Palace at Westminster." The concluding words may have been little more than parliamentary tactics to save Sir WILLIAM's own reputation, in case the outlay came under the inquisitorial scrutiny of JOSEPH HUME. It is sufficient for our purpose to take the Commissioner's opinion on a question of accommodation, and, as we have seen, he believed that the buildings "ought to be executed." Where art and architecture were concerned Sir CHARLES BARRY was undoubtedly the better judge, and when he says that the buildings are requisite for the completion of the Palace it does not matter much whether Sir WILLIAM MOLESWORTH did not agree with him.

It is easy to understand that in 1854 there was a fear of undertaking new works. The buildings had been subjected to the criticism of an ignorant public, and, as generally happens with good architecture in this country, the opinion on them was unfavourable. A Minister would naturally hesitate before giving another opportunity for men like Dr. REID to try experiments at the public expense. But the case is now different. In spite of all that has been said against them, the Houses of Parliament form a building of which England may be proud, and the money expended on its completion would be well laid out. A respect for archæology is a commendable quality in a Minister who has to deal with buildings, but, unless we are mistaken, future generations would prefer to see the Houses of Parliament completed rather than the most careful restoration on the proposed lines.

## ANTAGONISM IN ARCHITECTURE.

IT is an old truth in physics that action and reaction are equal and contrary. It may still hold, although so many things in natural philosophy have been set aside or simplified that advanced inquirers possibly are able to demonstrate that there is not the slightest difference between one kind of action and another. The subject we propose to consider is the influence of the principle in architecture, and we think it will be found that action and reaction have played an important part in the art.

We cannot better commence than by taking what may seem to have had very little to do with the subject—we mean the figures which are called caryatids. It was at one time imagined that they perpetuated the cowardice of the Caryans, who supported the Persian invaders, and who were afterwards punished by their Greek countrymen. The placidity of the women who carry the entablature of the Erechtheum, and who reappear in St. Pancras Church, is not, however, suggestive of a forced captivity or of humiliation of any kind.

The legend is, like many others connected with the history of architecture, based on an absurdity, and in books it has been superseded by others which are almost as fantastic. Would it not be more rational to suppose that caryatids are merely the expression of a principle which must have been in the minds of builders from the time that men first emerged from the caves in which they found

refuge? That principle is the stability which arises from the opposition of force to force, or of action *versus* reaction.

Long before NEWTON saw the apple fall, and from the phenomenon announced the laws which keep the stars from tumbling about and causing mutual destruction, builders knew very often to their cost that stones and other materials had a way of falling just as if they were endowed with life. We now interpret every collapse by ascribing it to gravitation, but what that means was as little known to NEWTON as to the builders of Babel. The primitive masons were not possessed of so simple a catchword to explain away difficulties, and a structure was to them something else than a mass of inert matter. When the Arabs say that an arch never sleeps, we have more than a rude attempt at poetry: it is an expression of a belief in a force that must be dangerous if it were not for the opposition of another that was equally powerful. Mr. RUSKIN, in his description of TURNER's pathetic *Téméraire*, suggests that it is the privilege of ships, among the works of men's hands, to be endowed with life in our imagination, but there is no reason why we should not likewise see in a building a thing which has to sustain the brunt of great natural forces, and which exists because it is able to overcome them.

It may be only fancy, but we cannot help thinking that the origin of the use of figures to support a part of a structure arose in a desire to express the opposition of force and the builders' victory. It is only by the aid of organic life that we can do so effectually. An algebraic formula will be more explicit to a mathematician than any work of a painter or sculptor, but in days when the world knew nothing of formulæ something else was needed. As symbolism nothing could be better than a row of figures like those of the Erechtheum. If they resembled the Telamones which are to be seen in Pompeii, they would be suggestive of a colossal weight, which was carried with so much difficulty that Titans were bent beneath it. But as we see that the Greek heroes are shown in battles with the calmest faces, so those Greek girls are perfectly unconcerned under their entablature. The figure in the Townley collection in the British Museum probably supported a Roman building, and may have been a reproduction of a Greek example. It suggests more than passive endurance, for one of the hands is extended as if in the act of discourse. If we like, we can suppose that the lady is laying down the difference between building of a massive and, so to speak, a brutal kind, and building which, by the recognition of what has to be done by the materials, becomes artistic. In the Arch of the Goldsmiths in Rome the caryatid represents a captive, and, therefore, unwilling support; and in some of those designed by MICHEL ANGELO it is difficult to see more than men who have grown weary of their burdens. With caryatids of the kind it is impossible to resist the conclusion that in a short time the weight must overpower the supporters, and to the majority of minds that would be an uncomfortable thought. It is only in cases where a lesson was to be conveyed to the owners of the building that they would be appropriate. COLBERT, for example, who evidently foresaw the effects of the building mania of his master, and who remonstrated in vain against the enormous expenses, might well have ordered unfortunate peasants to be represented as the supports of gateways. But if the Greek architects were only eager (as we suppose) to make all the onlookers understand that a heavy mass had been restrained from falling by their scientific skill, the beautiful figures they had carved were the best exponents of their idea. We see reaction personified in the most pleasing forms.

But without having recourse to sculpture, the Greek architect was able to suggest the everlasting opposition between loads and supports. He did so by his columns and stylobate, and to them we may add, perhaps the triglyphs. Columns, and especially Doric columns, are more expressive of support than a solid wall. Indeed, the wall of the cella seems so unimportant to the popular mind, that it is often difficult to make people realise that it existed. The massiveness of a Doric column was in excess, if we apply no other test than is afforded by a table of the crushing strength of stone. But in architecture a thing should not only be strong, but look strong. The fluting tended towards the expression of strength. No one can give any clue to its origin, but that the flutes imparted an

appearance of strength by the multiplication of the vertical lines, will be evident to any one who compares the upper and lower parts of the Doric piers under the railway bridge over the Thames in connection with the Cannon Street Station. The plain parts of the cylinders look less strong than those which are channelled.

The baseless Doric having been supposed to be an evolution directly or indirectly from the trunk of a tree, it ought to spring directly from the ground. But when that has been done with the fronts of village chapels and other buildings in England, the effect is anything but satisfactory. The stylobate not only gave dignity to the building, but it was apparently more secure as a firm platform than the ground itself. As DRYDEN says, "All below is strength and all above is grace." The limitation to the number of steps was an advantage, for when there are a great many steps with risers of uniform height, as in the Madeleine at Paris, the increase in effect is not proportionate to the increase in the quantity of cut stone. The investigation of the properties of a Doric temple is, however, better adapted for a large volume than for a few paragraphs in an article. We can only indicate a few of the ideas which are suggested when the building is considered in one relation.

In good building of all ages we think that there is sufficient evidence of a desire to express the antagonism between certain parts of the masonry. The boundaries between them have, of course, to be fixed arbitrarily, for caryatids and Doric columns are as subject to the law of gravitation as any part of the entablature which they support. A line has to be drawn somewhere to distinguish crushing from supporting, and according to the way it is done will be the character of the building. When there is no demarcation, as in the cubical blocks which serve for dwelling-houses, then it is difficult to produce a work of art.

The Greek artists made no secret of how their effects were produced, but Gothic architects were rather prone to be mysterious. The saying attributed to WREN when he saw the roof of King's College Chapel, "that if anyone would show him where he was to place the first stone he might construct such another work," would, in spite of its absurdity, be rather flattering to the builders of many of the churches. They endeavoured to excite wonder in the interior by suggesting that the roof was self-poised, or carried by columns of marvellous lightness, and capped with flowers. But on the outside we see another mode of treatment, and a legion of buttresses is a proof of a desire to make the most of the security that was necessary in order to keep the roof in its place. Flying buttresses are in their way as exaggerated as Doric columns, but they serve to suggest an enormous force on one side, and that it was to be withstood only by means of intricate devices.

There are many ways to express the difference between action and reaction in buildings, but they may be resolved into two classes. The first is by a difference in the character of the masonry, the second is by means of projections in one or another form. In modern towns the latter way is difficult to attain owing to the operation of various kinds of regulations. Buildings are from necessity in one plane from the ground to the roof, although the plate-glass in shop-fronts would cease to seem supporting the storeys above if the front could be brought forward for a foot or two. To explain the various ways in which masonry may be contrasted would be to write a description of the best examples of building in all parts of the world.

#### A BELGIAN CANAL PROJECT.

THE ministerial *Journal de Bruxelles* announces that among the works the Belgian Government propose undertaking to improve the canal system of Belgium, a first place is assigned to the project of putting the old city of Bruges in direct communication with the North Sea by means of ship-canal. Its projectors estimate the cost of constructing such a canal at a million pounds sterling, on which they will ask the Belgian Government to guarantee an interest of three per cent. for at least two years. This plan for restoring to Bruges some of its pristine prosperity is rapidly finding favour with many, not merely in Bruges

and Flanders generally, but also at Antwerp, Brussels, and even beyond the Belgian frontiers.

The idea of such a canal originated with, and has been ably advocated by, a Belgian civil engineer, M. DE MAERE-LIMNANDER, formerly Deputy for Ghent in the Belgian Lower House. His plan was originally to connect Ghent as well as Bruges by a deep and broad canal, which would find its outlet near Heyst, a rising seaside resort three miles north of the better-known watering-place, Blankenberghe. The canal from Terneuzen to Ghent renders an extension of the proposed canal to the last-named city a matter of little moment. Meanwhile the canal between Bruges and Heyst, between which places, as the crow flies, the distance is about nine miles, could be easily constructed. The soil is light. Little drainage work is requisite. Most of the country is below the sea-level. Three not unimportant canals converge at Bruges, at the spot where NAPOLEON I. constructed a roomy dock for the gunboats with which he intended invading England. Near this dock it is proposed to excavate a larger one, and to erect suitable warehouses. At the Heyst end of the proposed canal only low and narrow sand-hills would have to be cut through to obtain access to the sea. As the water is deep close to shore, short piers need only be run out to protect the entrance to the canal. As the tendency of the sea is at this point to eat into the shore by the swiftly passing and repassing of the tide, it is thought that there would be no risk of the silting of the canal mouth with sand.

The advocates of the canal aver that this cannot be demonstrated either of Ostend or Nieuport, both of which places have been put forward as proper outlets for such a canal. The opponents of the canal and the Government engineers employed by the late Liberal Government of M. FRÈRE-ORBAN contend that this question of keeping the entrance of the canal clear of those sands which four centuries ago destroyed Bruges' natural harbour has not been satisfactorily demonstrated. But some months ago several eminent English, French, Dutch, and Belgian engineers, unconnected with Government circles in Belgium, met at Bruges by invitation of the civic authorities there, and, after some deliberations and a visit or two to the coast, agreed to report favourably on the scheme. Two other points are also urged in its favour. The canal would be supplied with water entirely from the sea, consequently no drain would be put on the present canal system of Belgium, for which in dry seasons the water supply is somewhat precarious. Again, it is urged that a short line of railway from Heyst to Antwerp would bring London into more direct and rapid communication, *via* Gladbach, with the North of Europe. Some twenty hours, it is calculated, would be thus saved by the traveller between London and St. Petersburg. That, in comparison with such undertakings as the Suez and Darien Canals, or even with the Ymuiden Canal at Amsterdam, the difficulties and cost of the proposed seaport, with canal to Bruges, would be slight may readily be admitted. But the question that those who embark capital in the undertaking must ask themselves is whether it can be made remunerative.

M. DE MAERE, and those who side with him, urge in favour of the canal becoming a paying concern several specious pleas. They point to the present and ever-increasing prosperity of Antwerp—a port which, largely profiting by the piercing of the St. Gothard, now claims the first place among Continental seaports. They contend that as the military stronghold of Belgium, and as its communication with the sea is through Dutch territory, political events might injure even permanently Belgium's unique seaport. They assert, too, on evidence apparently trustworthy, that the depth of water in the Scheldt is diminishing, and that the day must come when Antwerp will be as much an inland city as is Bruges to-day. Lastly, they show that in winter the ice has more than once impeded the trade of Antwerp, and that on each occasion trade has betaken itself to Flushing, to the clear detriment of Belgian commerce. Suppose, they add, a more than usually severe and lasting frost set in, might not the chance that forced the traders to quit Antwerp induce them to establish themselves in the more favoured and open port of Flushing? Holland would reap what Belgium let drop.

It may be doubted if, so long as ships of large tonnage can make their way to Antwerp, that port will suffer a

diminution of its prosperity. Some sixty additional miles of water-carriage would always tell in favour of that city, just as a somewhat similar cause tells in favour of London, albeit there are splendid harbours more westward at Southampton and Plymouth. The political reasons brought against Antwerp hardly appear serious, for that city is to Belgium what the Colosseum is to Rome. When one falls so will the other, and with Belgium would go the Bruges canal.

The passenger traffic between London and the north of Europe certainly argues in favour of a roomy and easily entered harbour on the Belgian coast, and a point near Heyst may be a suitable one if connected by railway with the northern lines at Antwerp. But of what use then the canal on to Bruges? The King of the Belgians, on receiving some time back a deputation in favour of the scheme, recommended the people of Flanders to convert their fields into market-gardens for supplying the insatiable London market with vegetables. Such a plan might perhaps help the Flemish farmers in their present distress, which is rapidly reducing landowners, farmers, and peasants in what was, a few generations ago, one of the most productive countries in Europe to a level with their Irish brethren. A port at Heyst would certainly aid the Flemish in competing for our vegetable supply with people more favoured in clime further away, and who already send us their fruits and herbs through Belgium. But the suggestion made by King LEOPOLD hardly militates in favour of a canal to Bruges. Perhaps a trade may spring up with the Congo to justify its construction and make it a paying concern.

### EUGÈNE DELACROIX.

THE exhibition of the paintings by Eugène Delacroix, in the Ecole des Beaux-Arts, Paris, which was lately opened, has been remarkably successful, one of the best proofs being that several of the ministers and politicians of all parties have been attracted to the Quai Malaquais. The purpose of the exhibition is to raise funds for the erection of a statue of the painter, and it is likely to be accomplished, for over six thousand visitors paid for admission during three days. The collection comprises 239 pictures, sixty-eight drawings in water-colours, besides sketches, studies, &c. Articles on the exhibition have been written by nearly all the principal art critics in Paris, and among others by M. Albert Wolff in the *Figaro*, whose analytical studies of artists always insure attention.

The life of Eugène Delacroix, says M. Wolff, may be summed up in one word—work. His days were spent in his studio, and during the half century between his fourteenth and his sixty-fourth year, he held aloof from the world of Paris. In those days society had not mixed up artists and financiers, the industrious and the idle, for the sake of its pleasure. Every one lived in his own circle. In our time more gossip is written in a few years about an artist than was possible during the fifty years in which Delacroix laboured. He had no desire for notoriety, and his studio was shut against all but a few tried friends. According to his contemporaries the cause of his exclusiveness was that he was proud, haughty, self-contained. Delacroix belonged to a good family, and he kept up his connection with the Faubourg Saint-Germain. Occasionally he might be seen in some select salon, and it could hardly be supposed that a man who had the bearing and smiles of a diplomatist was the painter whose works were full of passion and revolt.

Géricault guessed rightly when, at the first sight of Delacroix, he said that the young artist was destined to become one of the forces of French painting, and this opinion was supported by Thiers in the days when he was a newspaper critic. His first picture of importance, the famous *Bark of Dante*, placed Delacroix in the very first rank among the creative spirits of painting, and henceforth his name was a battle-cry in the contest against the academics and their chilling mannerism. Géricault had thrown down the gauntlet when he produced his immortal *Raft of the Medusa*, and after his death Eugène Delacroix was recognised as his successor in the struggle to bring back French art to reality, or, in other words, to inspire it with life and passion.

The revolutions of art, like those of politics, are never free from excesses, and men pass from one extreme to another. It is natural that the leaders should, in spite of themselves, be sometimes carried away by the excitement of the time, and that their works should be marked by exaggeration. In the exhibition at the Palais des Beaux-Arts this is exemplified. We can see that all that was needed to gain for Delacroix the

highest position among painters was a calm and serene spirit. His life seemed to be a fever. In every work there are marks of the finest temperament and inspiration, but in the majority of them there are shortcomings which abate the impression that was made by the first sight. The works of Delacroix are at once majestic and defective; they excite our admiration by their arrangement, which is always appropriate to the occasion, and by their colour, which is always in harmony with the event; but we cannot help criticising them, and accordingly our pleasure is incomplete.

It very rarely happens that a picture of Delacroix sustains analysis when the momentary enchantment which arises from a first glance is over. The spell is transient. Scenes from sacred and profane history, subjects which have been inspired by great writers, recollections of Morocco, or of dreams, all alike have the glow of a first thought and an equal charm of colour. But when one wishes to affirm that a certain picture is a masterpiece one is arrested by something or other which makes us feel that, if Delacroix is one of the greatest of French painters, there was another artist who was still greater, and that it is Géricault, although he died so young, who holds the first place in the art of the century.

There is only a single work of Delacroix which approaches the grandeur of Géricault's *Raft of the Medusa*. It is the *Entry of the Crusaders*. The two works denote the culmination of French art in this age. The picture is the truest exponent of the genius of Delacroix, a work of thought and handling, worthy of admiration on account of the grandiose character of the legendary figures, and of the landscape which environs them. If we wish to value the painter justly, we must often return to this vast work, to his ceiling in the Gallery of Apollo at the Louvre, or the decorative paintings in the Chamber of Deputies. Eugène Delacroix was above all a man of grand thoughts, and it was in works of this class that he was more in his element than with ordinary easel pictures. Among the latter class there are fine works, but the genius of the artist was restricted by their limits, for it required a large surface to display its fervour. There is an apparent disproportion between the largeness of ideas in his smaller pictures and the size of the canvas.

If he had lived in an earlier epoch Delacroix would have inscribed his art on the walls of churches and palaces like the old masters, whose good fortune it was to belong to an age when painting was recognised as an integral part of architecture, and the largeness of the available spaces gave wings to the painter's thought. We must imagine what he might have been if there were walls and ceilings at his disposal, and regard his easel pictures as if they were the cruel restrictions which had impeded the development of his power.

He was, however, spared from the difficulties of other painters of his time. Delacroix inherited an income of about fifteen thousand francs, and in 1830 to such a man it was a veritable fortune. He was thus freed from the necessity of producing pot-boilers. In the early part of the century painting was not considered in its commercial relations; the romanticists felt they were the torch-bearers, whose mission it was to enlighten the world rather than to make their fortune. Delacroix sold his *Good Samaritan* for 300 francs; now it is worth 30,000 francs. He was paid 1,000 francs for his *Hamlet and the Gravedigger*, and his splendid picture, *The Two Foscari*, brought 2,500 francs. And yet it is recorded that in spite of the price it was difficult to find purchasers for his pictures, for he never condescended to attract the public.

Delacroix may be said to have been self-taught—his art was the result of a loving contemplation of the ancient works in the Louvre, and of a hatred against the style of historical painting which he saw in practice. He was but a short time in the studio of Guérin, and that artist did not conceal his dislike of his recalcitrant pupil. Géricault was the youth's idol; and when Delacroix gained an introduction to him, he was overpowered by the painter's recognition. The request for one of his sketches seemed so great an honour that Delacroix felt as if he had been knighted, and bent his knee when he offered his drawing.

Apart from his art, Delacroix was entitled to distinction. He spoke little, but a vulgarism never passed his lips. In his most intimate correspondence there is always something superior. He was a good listener, and whilst one spoke to him the intensity of his gaze seemed to pierce one's thoughts. He was little accessible to flattery, and disdained attacks. In the midst of the war that raged about him and his works, he alone seemed to take no part. He was like one of those strategists who, in their cabinets, plan battles on paper. With every fresh picture the contests assumed additional violence between the partisans of romanticism and of classicism. As happens in such cases, there was injustice on both sides. Those who denied the genius of Delacroix were as much in the wrong as those who scorned Ingres. Time has allotted to both their true positions. We can now recognise in Delacroix a magnificent colourist, and in Ingres one of the purest of draughtsmen, without running any risk from either party.

There is a close affinity between the genius of Delacroix and that of Victor Hugo. The great writer is a colourist like the great painter. The two men have revolutionised the literature and the painting of their time. They have rescued art from the formulas in which it had been imprisoned; they have restored the connection between the past and the present, which had been broken, and both have been derided for the sake of that conventional art which enabled mediocrity to strut with an air of triumph. Both, however, have had their satisfaction, and have gained renown by the overthrow of their enemies.

But it was not granted to Eugène Delacroix to witness the glorifying of his name—he was without the robust health of Victor Hugo, which defies time. Delacroix was always ailing, and in his studio he was to be found in winter clothing, with a thick woollen muffler around his throat. It may have been from this cause that he was misanthropic. He lived always solitary, whether in his modest *atelier* in Paris, which formed such a contrast with the magazines of rugs and silks where contemporary artists labour, or in his country-house at Champrosay, where he received a few intimate friends. But even to them the private life of Delacroix was hermetically sealed. He had no time for trifling, and scandal-mongers could never make free with his name. He had a foreboding that he was not destined to enjoy a long life, and to filch an hour from his art appeared criminal. Delacroix attained, however, his sixty-fourth year, and the heretic, who was so long excommunicated, had before his death the satisfaction of sitting among enemies in the Institute. Not one vote was solicited by him. The election was owing to the friendly spirit of M. Robert Fleury, and ten years earlier it would have been considered an impossibility. He took his seat as a conqueror.

When we wish to judge of an illustrious artist we must take into account the manner of his death as well as his life, for at the last hour a great spirit often reveals itself with peculiar majesty. It may be said of Eugène Delacroix that his end was worthy of him. His artistic convictions surmounted all the terror of the closing days, and he met death with the loftiness that beseeemed a grand soul. When he felt that he had done with this life, he returned to Paris, in order that he might die in his studio, as if it were a battle-field, and surrounded with the trophies of his hand. There was no complaint heard from him, not even a regret at quitting this world. He sent his housekeeper, who had grown old in his service, to bring a notary, and to him he dictated his last wishes with the utmost calmness and serenity. When the legal formalities were over, he ordered that he was to be left alone, and thus, without a witness, he awaited death.

Now, after twenty years have elapsed, it is proposed to erect a monument to Delacroix. But, if it is to stand in the Place Vintimille, it is to be hoped the project will be abandoned, for it is hardly worth the trouble to have a statue in such a position. The site that is most befitting for a statue of Eugène Delacroix is in the court of the Louvre, near the works of men who were his ancestors in art, and where it would be constantly seen by the young artists of France.

## THE RESTORATION OF WESTMINSTER HALL.

ON Monday last Mr. Shaw-Lefevre, M.P., gave evidence before the Restoration Committee. The late First Commissioner of Works explained the circumstances under which, on the demolition of the old Law Courts, he had instructed Mr. Pearson to prepare plans for the restoration of the west side of Westminster Hall, then for the first time exposed to view. Mr. Pearson's instructions were in general terms, and the plans prepared were the result of that gentleman's inquiries, uninfluenced by any pressure from the Office of Works. It might be considered that the idea of completing Sir Charles Barry's scheme had been given up. As to the possibility of utilising the vacant space for the erection of public offices, according to his view there was no very serious demand for accommodation at the Houses of Parliament that could not be met by a rearrangement of the rooms already existing under the roof of Westminster Palace. If in the future any further considerable needs were apparent, he thought they might proceed in the direction of utilising official residences, and he mentioned the rooms occupied by Black Rod and the librarian of the House of Lords as premises which might be appropriated to the general service of the House. With regard to Mr. Ayrton's statement that the country was paying 37,000*l.* per annum for rent of Government offices, he pointed out that no inconsiderable portion of this sum was devoted to offices in the provinces, and could not, of course, be saved by the provision of further accommodation in London. About 15,000*l.* a year was paid for offices in the West End, including 8,000*l.* for the War Office—an item which would disappear on the completion of the new offices—and the rents

for the offices of the Board of Trade, Charity Commission, and Land Commission, none of which could be conveniently removed to rooms at St. Stephen's. Royal Commissions, he thought, might be accommodated at the House, and by this step 3,000*l.* a year could be saved. It was not, in his opinion, worth while to spend a large sum of money in building rooms for Royal Commissions, as there were committee rooms which could be placed at the disposal of those bodies. The total cost of the execution of Mr. Pearson's plans would be 34,000*l.*, of which 5,000*l.* would go to cover the cost of completing Sir Charles Barry's work in St. Stephen's Porch. Of the 29,000*l.* remaining, 16,000*l.* must be expended under any circumstances, so that for 13,000*l.* they would get two galleries, a large room, and a stand for horses.

### BIRMINGHAM ARCHITECTURAL ASSOCIATION.

THE annual dinner in connection with the Birmingham Architectural Association was held on Tuesday evening, at the Grand Hotel, Colmore Row. Mr. F. B. Osborn, the president of the association, occupied the chair, and among those present were Messrs. W. H. Kendrick (vice-president), V. Scruton (hon. sec.), J. Cotton, A. Reading, F. Cross, H. Collett, F. G. Hughes, F. C. Spencer, J. K. James, D. Cochrane, H. Lloyd, T. F. Newton, J. Pratt, E. Taylor, T. Tonks, F. Camm, Lakin Smith, Hart, &c.

The President proposed the toast of "The Association," remarking that the association was deserving of the most hearty support, as it was the only representative assembly of the profession of the art of architecture in the town, and also on account of the important educational work it was doing amongst students and younger members of the profession. There were many useful classes in connection with the association of a social and pleasant character, by means of which members had opportunities of instruction in architecture which they would otherwise find it difficult to obtain. The association was eleven years old, and he was pleased to say that it was stronger and more vigorous at the present time than it had ever been before. The classes, he understood, were well attended, and the papers read at the meetings were instructive and valuable. He advised young architects to join the association on account of the advantages they would receive; and he also advised older architects to become members for the purpose of giving that assistance to the younger members which it was advisable they should have.

Mr. Kendrick responded, expressing an opinion that the association had a brilliant future before it. He suggested that representations should be made to the Town Council for the establishment of a technical museum for the benefit of the profession, and observed that in the new Art Gallery accommodation might be found for a section devoted to the interests of the association.

Mr. Doubleday gave "The health of the President," and urged that the Post Office authorities should be requested to allow the designs for the new post office to be confined to Birmingham architects.

The President, in reply, said he would endeavour to do all he could during his term of office to advance the interests of the association.

Other toasts were proposed, and were interspersed with vocal and instrumental music.

### TESSERÆ.

**Bramante as an Architect.**

PROFESSOR DONALDSON.

THE predominating principle of Bramante's idea of architecture is breadth. He, therefore, lays down in his composition a great mass. To diversify this, he introduces slightly-projecting orders, which in their whole, as well as their parts, he preserves also small to serve as contrast. These orders are elegantly profiled, though it is to be remarked that they are too much portraits of each other. His openings are also very small in order not to destroy the effect of his mass. These details produce an incongruous medley of nobility and meanness, dry in effect, hard in detail. All the elevations of his palaces appear like neat architectural drawings unshadowed, with the under lines of the cornices and one side of the perpendicular projections marked with a thicker line. His courts, however, are very elegant and effective. There is this great defect in Bramante's buildings, that not one of them is soundly built. All his constructions are falling in some part or other, and only kept together by iron ties put in since his time. The noblest of Bramante's works is the Court of the Belvedere at

the Vatican, where he has displayed much ancient magnificence by means of grand flights of steps, uninterrupted lines of statues, pedestals, and fountains.

### Coignet's Concrete.

CAPTAIN FOWKE.

M. Coignet has, as a series of experiments, given us the recipes for making two kinds of concrete suitable for house building, which he distinguishes by the epithets of economic concrete and hard and solid concrete. The first is composed of sand, gravel, and pebbles, 7 parts; argillaceous earth, 3 parts; quicklime, 1 part. This concrete, he says, properly beaten up and mixed, has given walls nearly as hard as the common soft rubble masonry used in Paris. In price it competes with ordinary pisé work, over which, however, it has the advantage of being able to resist moisture. The hard concrete is composed of sand, gravel, and pebbles, 8 parts; common earth, burnt and powdered, 1 part; cinders, powdered, 1 part; unslaked hydraulic lime, 1½ parts. The materials to be perfectly beaten up together. Their mixture gives a concrete which sets almost immediately, and becomes in a few days extremely hard and solid, which property may be still further increased by the addition of a small quantity, say one part, of cement, and the price, depending principally on that of the time and labour, was in Paris, under unfavourable circumstances, 3½*d.* to 4*d.* per cubic foot; with more favourable conditions, 2*d.* per cubic foot. A house, three storeys in height, 65 feet by 45 feet, standing on a terrace, having a perpendicular retaining wall 200 feet in length and 20 feet high, has been actually constructed with every part, including foundations, vaults of cellars, retaining wall, all walls, exterior and interior, without exception, of this hard concrete (Beton Dur), as well as the cornice, mouldings, string courses, balustrades, and parapets, and without bond iron, lintels, or wood throughout. The use of plaster in the interior is also avoided, as the concrete takes a surface sufficiently fine for papering.

### Buckingham Palace.

F. L. G. VON RAUMER.

Many objections might be made to the external arrangement and proportion, though its extent and the colonnade give it an air of grandeur. But what shall I say of the interior? I have never seen anything that might be pronounced in every respect more of a total failure. I should not care to have a free residence in it, for I should vex myself all the day long at the fantastic mixture of every style of architecture and decoration, the absence of all pure taste, the total want of an eye for measure and proportion. Even the great entrance-hall does not answer its object, because the principal staircase is on one side, and an immense space, which has scarcely any light, seems to extend before you, at the entrance, to no purpose whatever. The grand apartments on the principal storey are adorned with pillars; but what kind of pillars are they? Partly red, like raw sausages, partly blue, like blue starch; bad imitations of marble, of which there is none, standing upon blocks, such as art rejects, to support one hardly knows what. Then in the next apartment no pillars but pilasters—these pilasters without base or capital, and those with a capital, and the bases foolishly cut away. In the same apartment fragments of Egypt, Greece, Etruria, Rome, and the Middle Ages, all confusedly mingle together; the doors, windows, and chimneypieces in such incorrect proportions that even the most unpractised eye must be offended. The spaces unskillfully divided, broken, insulated; the door sometimes in the centre, sometimes in the corner, nay, in one room there are three doors, differing in height and breadth; over the doors in some apartments bas-reliefs and sculptures, where pigmies and Brobdingagians pell-mell together, people from 2 to 6 feet high range admirably together. The smaller figures especially have such miserable spider legs and arms, that one would fancy they had been starved in a time of scarcity, and were come to the king's palace to fatten themselves.

### English Painting in the Thirteenth Century.

DR. E. A. BOND.

In the course of the thirteenth century the arts of painting and of illumination left the cloister and became a secular profession. Warrants for the execution of mural paintings in the royal palaces, from the time of Henry III., show that the artists employed lived by their work, and were not always ecclesiastics. Works of poetry, of romance, and of history began to be freely circulated, and must have helped to establish a large class of illuminators and miniaturists. Books of devotion, too, were more generally in the hands of laymen. A number of minutely-written and compact Bibles are still extant, written from the middle of the thirteenth century, partly, no doubt, for the use of the mendicant friars, but principally, I conceive, for the convenience of students and laymen. The psalter especially, accompanied with the litany, canticles, and prayers, and forming the private service book of the time,

was extensively circulated among the laity; and it was on such manuscripts that the highest talent of the miniaturist and illuminator was exercised. Entries in the royal wardrobe books of the period show that professed painters were employed in illuminating manuscripts for the sovereign; and writers and illuminators were attached to the king's household. With this secularisation of the art painting rapidly threw off the conventionalism of the cloister, and instinctively turned to the study of nature. Up to this time the ornamentation of manuscripts had been architectural in its character. Mouldings of arches and sections of pillared piers were adopted as designs for illuminated initial letters. But from about the middle of the thirteenth century, the forms of foliage and of animals began to be copied from nature. Where a leaf is timidly introduced at the extremity of the border lines springing from the initial letters, we are able to recognise the foliage of the oak, the vine, or the ivy. And when the figure of an animal breaks the stiffness of the ornamental lines, it becomes the genuine portraiture of a bird, a dog, a hare, or monkey, executed with more or less success; or, if a monstrous compound, still designed with a regard to the true forms of its component parts. The study of the human figure and the art of composition were no less attended to, and probably at no other period was the progress of these higher branches of the art so rapid as during the latter half of the thirteenth century.

#### A Sixth Order.

SIR WILLIAM CHAMBERS.

The ingenuity of man has hitherto not been able to produce a sixth order, though large premiums have been offered, and numerous attempts been made by men of first-rate talents to accomplish it. Such is the fettered human imagination, such the scanty store of its ideas, that Doric, Ionic, and Corinthian have ever floated uppermost; and all else that has ever been produced amounts to nothing more than different arrangements and combinations of their parts, with some trifling deviation scarcely deserving notice, the whole generally tending more to diminish than to increase the beauty of the ancient orders.

#### The Church of St. Martin-in-the-Fields.

J. H. BURTON.

The work on which Gibbs's fame rests as the embodiment of a great thought unbroken by partial defects, is the church of St. Martin-in-the-Fields, fortunately opened up to the admiration of the present generation by the works in Trafalgar Square. It was a bold and an original idea, greatly censured in his day as a barbarous combination of two distinct and antagonistic types of architecture, and a rank rebellion against the first Horatian rule of taste. The spire or steeple had been held peculiar to Gothic architecture, and was deemed the natural terminus of the aspiring character of the pointed arch. Yet Gibbs placed a spire on a pediment supported by Corinthian columns. It was, however, no mixture of styles in luxurious confusion like the efforts of the French Renaissance. The edifice in itself was untainted by Gothic, and even on the spire that architecture had no more claim than merely as it was a spire, since its details were carefully and severely Classic. Illegitimate or not it was a great hit in architecture—something like Michel Angelo's mounting the dome in air—and became so prevalent that it is now never deemed an anomaly. For the general merits of the building it may be truly said that it is one of the chief architectural glories of London. Formerly buried in a mass of obscure streets and lanes, its thorough architectural character has been tested by the severest ordeal to which the innate character of a building can be trusted—a general clearing away which lays it bare for all full inspection and either close or distant criticism. To try how it bears this, look first upon St. Martin's and then turn to the costly modern edifice to the right, built as a suitable repository for the artistic treasures of the British Empire.

#### Economy in Scottish Architecture.

R. W. BILLINGS.

The Scottish have always been taken for an economical nation, but they sometimes carried this feeling of economy into most extravagant architectural faults. In general, however, they carried their decoration only so far as it was absolutely necessary. Take one of the pinnacles of Roslin Chapel, for instance. There are three sides in sight, and these, as you know, are richly carved. The crockets are beautifully finished, and not only that, but the face of the pinnacle itself is a perfect network of elaborate detail. Go to the back (the fourth side), and you will find that, where you cannot see it, it is as plain as possible. The same things occur at Melrose Abbey. Economy was the order of the day wherever nothing could be seen. They carried their decoration only so far as it seemed absolutely necessary, but not one jot further. The English never seem to have carried the same feeling into their works, for, in sight or out of sight, the work is all finished in the same way.

Perhaps no nation in the world ever made so much use of simple materials as the Scottish, or have changed so little in the course of ages the staple of their ornamentation. This is a very remarkable feature in the architecture of Scotland, and marks it from every other nation on the face of the earth. Now, for instance, if we look to the use of the bead moulding, you will find, beginning at the columns of the Abbey in Dunfermline, and taking the decoration of windows through all times, down to the era in which you have no architecture (the reigns of George III. and George IV.), that this was the staple of all the ornamentation of the country. Then look at the fine effect on some of the most elaborate buildings in the country by the mere use of the chamfer. The great window in the west front of Dunblane Cathedral illustrates this in a remarkable manner. In many English buildings there is a shower of small mouldings; but here is economy combined with elegance, and a breadth of effect which is the very life of the composition. The west window at Brechin has it even in a still more remarkable degree, because in the window itself the simple mullion does not go through it. It has three stages of simple chamfer mouldings. It is a Flamboyant window, without the intricate mouldings of that style. Another peculiar feature of economy we see in the old castles. When Scotland had done defending its castles with cannon, the gun-holes which perforated these battlements were changed in use, but not in form. They were changed to the use of the opposite element—they were made into water-spouts. The battlements themselves shared the same fate, and were treated even more ignominiously; for when they had done service they were literally turned upside down for ornament, showing that their occupation was gone.

#### Variation in Prices of Paintings.

J. J. JARVIS.

The *St. Jerome* of Correggio was executed by him for a price equivalent to about 200 dols. In 1749 the King of Portugal offered 90,000 dols. for it. When the French had possession of Parma the Duke vainly offered 200,000 dols., or a million of francs, to redeem it from being sent to Paris. Correggio's *Magdalen*, at Dresden, was valued at 27,000 dols. at its purchase with other paintings. A *Holy Family* of Murillo's, in the National Gallery at London, was bought for 31,000 dols. Prince Demidoff, in 1837, at the sale of the Berri Gallery, paid 45,000 dols. for fourteen pictures, one of which, the *Breakfast of Ham*, by Teniers, sold for 4,900 dols. At the same sale Demidoff paid 7,500 dols. for the *Pasturage*, by Paul Potter, 1806. One of the pictures was bought in London for 9,600 dols. The best Ruysdaels are now esteemed at from 5,000 to 6,000 dols. each. A century ago they could have been bought for the tenth of that sum. Ostade's pictures are still more valuable. In 1837 his *Village Dance* brought 4,400 dols. The two famous Claudes in the British Gallery were sold in 1804 for 20,000 dols. each. A good Claude readily brings from 5,000 to 20,000 dols., according to its merit. Rembrandt's pictures are equally in esteem, being worth from 1,000 to 15,000 dols. each. In 1844 two of his portraits brought 3,500 and 4,900 dols. respectively. In 1817 West received 4,000 dols., or 80*l.*, for his *Annunciation*; in 1840 it was sold by auction for 10*l.*, or 50 dols. It would be a curious inquiry to trace the price of celebrated works of art from the time they left their author's studios to the present day. But the above examples are sufficient to give an idea of the varying pecuniary estimation put upon art by dealers and amateurs.

#### Weights on Crowded Floors.

In the course of the discussion at the Institution of Civil Engineers of a paper on "The Construction of Charing Cross Bridge," Mr. E. A. Cowper said he had tried the weight of a number of labourers, by weighing each man individually, and then by measuring the exact space they occupied when standing close together, as in a crowd, when he found their collective weight was fully 140 lbs. per square foot. He was, however, aware that from 60 lbs. to 80 lbs. was often taken as a test load, but that was far below the weight of a crowd of able-bodied men. Mr. Mallet remarked that, during the building of Buckingham Palace, Mr. Nash ascertained the greatest possible load of human beings that could be brought upon a given space, with reference to the so-called fireproof floors of the palace. Within a hoop, he thought of about 20 feet diameter, as many men were caused to stand as could be wedged into it, the last men being lowered down amongst the others. The result gave a load of 120 lbs. per square foot. Mr. Hayter stated that 70 lbs. per square foot was probably the maximum living load that could be crowded on a given space. Messrs. Cochrane & Co. had tried an experiment, selecting for it the tallest and most muscular men in their establishment, and the result proved that the estimate of 70 lbs. was ample. Sir John Hawkshaw said he had been found fault with for assuming so much as 80 lbs. per square foot as the weight of a crowd of human beings. French engineers and others were said to be content with 50 lbs. to 60 lbs. per square foot, but he was satisfied with 80 lbs. per square foot.

## NOTES AND COMMENTS.

THE late actions respecting the picture in which a portrait of M. DUMAS was introduced, and others of the same class, have suggested a subject for a conference of the French advocates. The question debated was whether an artist, who is devoid of any intention of bringing disrepute, can introduce a person's portrait in a picture without authority. It was decided in the affirmative. The French being fond of caricatures as a people, it is surprising that any one should become irritable at seeing a distorted figure of himself or herself in a shop window. It is only in Paris that we could find advertisements from artists connected with the comic papers offering to draw the "charge" of any one who will send a photograph, and is willing to pay for the honour of being converted into a subject for laughter.

A DEPUTATION from the Sunday Society had an interview with the trustees of the National Gallery on Tuesday, in order to explain the advantages of opening the gallery on Sundays. Sir AUSTEN H. LAYARD in replying said that a majority of the trustees were in favour of opening the gallery on Sundays, but they were powerless to carry that inclination into effect. Beyond the questions of religion and cost, there could be no objection to opening the gallery, for there would be no difficulty in accommodating the number of people, however great, who might take advantage of Sunday to become acquainted with works of art. They hoped that Parliament would soon give its vote in favour of the opening of museums and galleries on Sundays, and when that step was taken he could assure the deputation that no time would be lost in giving effect to the decision.

At the Congress of Orientalists in London in 1874 the editing of the "Book of the Dead," which was a sort of Bible to the ancient Egyptians, was, at the suggestion of Herr LEPSIUS, entrusted to M. EDOUARD NAVILLE, of Geneva. It was a most onerous undertaking, for all the museums in Europe had to be ransacked in order to collate the various papyri in which there was a reference to the book. After more than nine years of incessant toil, M. NAVILLE was able in last May to announce the completion of the work to Herr LEPSIUS, the German Egyptologist, through whose influence the Berlin Academy had voted the sum that was necessary for the preliminary expenses, and the Prussian Government had promised to defray the cost of publication. When LEPSIUS died it was feared there would be official impediments to the fulfilment of that promise, but owing to the exertions of Professor DILLMANN, it has been definitely arranged that the work is to appear about the end of the present year. The publishing has been entrusted to the firm of ASHER & Co., of Berlin. There will be two large volumes, one containing the text, with 212 photographic plates. The text will be in accordance with papyri of the eighteenth and nineteenth dynasties, when Egyptian civilisation was at its height. The second volume will give various readings, and is to have 448 plates. There will be an introduction and criticism by M. NAVILLE, and it is needless to say that the appearance of the work will be hailed by scholars.

So many works of PRADIERS are to be found in France, it is not strange that the great sculptor is claimed as a Frenchman. He was born in Geneva, and was proud of his birthplace. At one time he proposed to present a fountain to the city, and modelled the figures on a small scale, but now that the design is needed no trace of it can be found.

THE Book or Ritual of the Dead received its title from the circumstance that copies were deposited sometimes in the tombs with the mummies, and it was even supposed to be a passport to the Aahla or Elysium. Extracts were inscribed on the outer bandages of the mummy. Part of it dates from time immemorial, but the book is supposed to have assumed a definite form about eighteen centuries before our era—a period when the Hebrews were suffering under Egyptian taskmasters. The text is illustrated by drawings, one of which, representing the weighing of actions

in a scale, has been often reproduced in books on Egyptian antiquities. In 1841 a version now in Turin was published by LEPSIUS; but later inquiries have shown that it is but a comparatively recent copy, and the collation of so many papyri by M. NAVILLE will, it is expected, reveal much concerning the faith of the Egyptians. For work of the kind there is much advantage in having photographic processes. In England it is even more essential, for, so far as we know, there are no hieratic or hieroglyphical types in London.

A MEETING of the Western Nail Association was lately held in Chicago, when it was reported that iron nails are being driven out of the market by steel nails. Already one-half of the nails manufactured in Wheeling are made of steel, and the machinery and plant necessary for their manufacture are being erected at nearly every nail foundry. At first there were doubts and objections urged against steel nails. The heads flew off in driving, it was said, and carpenters did not believe they would hold in wood as well as the iron nail. A little more care in the manufacture has obviated the first objection, while experience has shown that the last is wholly groundless. Under present conditions, steel nails can be made cheaper than those made of iron, but the plant is very expensive, and its erection and general adoption will render almost worthless the vast outlay of capital now invested in the old-fashioned nail factories.

It is reported from Rome that in the excavations of the Rue du Statuto a fine statue has been found, which may have represented CERES, as there is a cornucopia. It is of marble, and over three feet in height. With the exception of the base, the whole of the statue is in good preservation. Near it were two bas-reliefs in a similar condition.

THE interminable case relating to the VERE FOSTER drawing-books is once more before the Irish Courts. The dispute arose in 1876. After a long litigation, the Courts decided that Mr. FOSTER was entitled to the lithographic stones which were used for the examples of water-colour painting in the drawing-books. In case they were not all delivered, it was ordered that an inquiry should be made—first, to ascertain specifically the lithographic stones that had been withheld; second, what damage was sustained up to the date of the amended writ; third, what further damage the plaintiffs had sustained. It is now alleged by the plaintiffs that lithographic stones containing designs for fifty books had been given up; and stones containing designs for thirty-five books formed a series known to the trade as "Vere Foster's Drawing Copy-books" had not been given up. The fifty books were uncoloured and the less valuable; the thirty-five were coloured and the most valuable, representing one-half of the money-producing value of the series. Moreover, they had been out of print since March 9, 1881. Between 1878 and 1883 the plaintiffs' firm had sold over a million copies of the imperfect set, the profit on them being on the average over 2% per thousand, and as compensation for the loss by reason of the series being imperfect, they claim 1,000%. In compensation for reproducing stones in place of those detained, they claimed 1,005%. The defence is that the stones have been worn out. The case has not been decided, and when it is said that there are five Queen's counsel engaged, the end may be far off. Is not this one of the cases which seems adapted for arbitration? The subject is as technical as buildings.

BIRMINGHAM is supposed to be a town where business is conducted in the most perfect manner, and an engineering contract entered into by the Corporation might be expected to correspond to a penny with the estimate. But the ratepayers are about to understand that unexpected contingencies can arise in other works as well as in building. In 1881 the Corporation approved of a drainage system for Cole Valley district, of which the cost was estimated at 28,000%. The actual cost is in round numbers 62,000%. If the amount paid for a way leave to owners and occupiers be deducted, there will remain about 55,000% for works alone, or almost double the estimated cost. The additional expense is ascribed to the unexpected discovery of running sand along a great part of the line, at a time when it was too late to divert the course of the sewer.

The Architect March 21<sup>st</sup> 1885.

— NEW WESLEYAN CHURCH, SWANAGE, DORSET —  
Edward W. Jennings, Architect —

## ILLUSTRATIONS.

A FAMILY GROUP.

THIS illustration has been taken from a decorative painting by M. EHLMANN, of Paris, whose fine frieze, *The History of Art*, lately appeared in *The Architect*. The original is in the house of M. ENGEL, in Bale, and fills the space over the chimney-piece. It will be acknowledged that M. EHLMANN'S treatment of the subject shows a wide departure from the ordinary portrait groups by modern painters, and that the artist has accomplished a difficult work by converting an incident in everyday life into something that is idyllic.

WAREHOUSES, WOOD STREET AND PHILIP LANE, E.C.

THE above illustrations show portions of Messrs. RYLANDS & SON'S extensive premises, as re-erected and enlarged since the Wood Street fire in 1882, from the designs of Messrs. JOHN & JOHN BELCHER, F.R.I.B.A. They have been well carried out by Messrs. A. & E. BRAID, of Chelsea.

NEW WESLEYAN CHURCH, SWANAGE, DORSET.

THE Wesleyan church, of which we publish an illustration, is about to be erected at Swanage, Dorset, in order to meet a pressing and long-felt necessity in this town, which possesses so many interesting associations with the early history of the connexion. The success in carrying out the church will have been entirely due to the energy of the Rev. G. TERRY, B.A., who has already distinguished himself in a similar manner in other circuits. The building, which is to accommodate, exclusive of side galleries, upwards of 550 people, presents on the exterior the features mainly of the Flamboyant style, and will be executed in local stone, with Langton stone dressings to buttresses and small windows, while the spire and other portions possessing a greater amount of work will be of either Bath or Ancaster stone. The architect is Mr. EDWARD W. JENNINGS, of Swansea and Bournemouth.

ST. MARY'S ROMAN CATHOLIC CHURCH, FLINT.

THIS illustration shows a new Roman Catholic Church, which has been lately designed by Messrs. SINNOTT, architects, of Liverpool. As is usual in such cases it has been necessary to recognise the fact that little money is forthcoming, and reliance has been placed on form rather than ornament.

ALLERTON, CANNES.\*

ALLERTON, Cannes, Alpes-Maritimes, the winter residence of Mr. John Grant Morris, is situated on a shoulder of the Californie Hills, which form the eastern boundary of the Bay of Cannes, and at a height of nearly 300 feet above the sea. It consequently commands a most extensive view. Directly beneath it to the south are the islands of Ste.-Honorat and Ste.-Marguerite, to the west of which is seen the whole extent of the Bay of Cannes, broken only by the harbour and the fortifications of the old town. Behind the harbour rises the long range of the Esterel Mountains, and beyond again in clear weather are seen the pale blue lines of the hills about Toulon. To the left, from the upper floors and the higher parts of the grounds, there is a fine view of the Bay of Antibes and the snowy mountains beyond Nice.

The house stands in a property of about seven acres. In front of it the gardens fall rapidly to the main road, and behind they rise and finish in a wild and rocky pine wood, which entirely protects the house from the north and east winds. The angle bay of the drawing-room is placed so as to command the most striking view of the bay and old town. The porch is on the north, and behind the drive winds round the hill to the stables seen to the right of the house in the perspective view. The whole of the walls of the house are of a very hard blue-grey limestone from the Vallauris quarries, built without regular joints or beds. On the northern and eastern sides they are lined with a thin brick wall and cavity. The whole of the dressings are of Arles stone, all moulded and carved in position. The floors throughout were constructed with small rolled iron joists, and brick arches levelled up in concrete. In every case the bricks used were the light hollow bricks from Ste.-Henry.

A difficulty having arisen about the roof covering, slates from this country were specially sent out, both for the house

and stables. The floor of the loggia, vestibule, and hall is in marble mosaic, executed by Messrs. Burke & Co., of Newman Street, London, and of Paris; and a Carrara marble staircase leads up to a first-floor corridor, also paved with marble mosaic. The floors of all the rooms are of polished parquet. The windows are furnished with louvered shutters, mostly of wrought iron, so arranged that they fold into recesses in the jambs and mullions when not in use.

The contractor for the work was M. Caisson Ainé; Mr. Thomas Lowe, an English plumber, being engaged to carry out the sanitary arrangements under the direction of the architect, Mr. Alfred Waterhouse, A.R.A., the sanitary materials being sent out from England.

## THE ABERDEEN FREE LIBRARY.

THE Building Sub-committee of the Aberdeen Free Library have been inquiring for the most eligible site for the new buildings. The conditions are that the site should be as near to the centre of the town as can conveniently be arranged; (2) that it should, if possible, be ground either unoccupied by houses, or having on it houses of so little value that the cost of their removal would not be expensive; and (3) that it should be such as to permit of the library building being extended at a future time, without the necessity of purchasing valuable property.

It is calculated that provision will have to be made for 40,000 volumes. With this number of volumes as a basis, the following calculations will show the space required for the various requisites of the library, viz.:—(1) For the Lending Library, a room, say 60 feet by 70 feet. (2) A magazine-room, 60 feet by 40 feet—if newspapers to any large extent are procured, the dimensions of this room would require to be increased in proportion. The two rooms just mentioned might be on the same floor. (3) The Reference Library, which would require to be larger than the Lending Library, say 60 by 90 feet, would occupy the upper floor. Beside it might be (4) a smaller room, 60 feet by 20 feet, for containing the specifications of patents, newspaper files, and the like. In addition to these rooms, space would have to be found for a vestibule, a staircase, a librarian's room, a committee-room, a large working-room for the routine work of the library, lavatories, storage and heating apparatus, &c. To provide for all this accommodation, the building would require to be 150 to 160 feet in length, and 65 to 70 feet in width.

Three sites were suggested, one at the east of Gray's Art School, a second near Robert Gordon's College, and a third on the east side of Union Terrace to the north of the footbridge. On a careful consideration of the whole circumstances of the case, the sub-committee are decidedly of opinion that the last-named site is the cheapest obtainable, and in every respect the most suitable for the library.

## THE WASHINGTON MONUMENT.

THE construction of the Washington Monument was begun in the early summer of 1848, by the Washington National Monument Society. The structure, as designed by Robert Mills, was an obelisk 600 feet in height, with a very flat apex, surrounded at the base by a pantheon, with a peristyle of marble columns 100 feet high.

Shortly after the commencement of the work, the height of the obelisk was reduced to 500 feet, and the building of the pantheon deferred to some future date. The foundation of the obelisk as constructed was 80 feet square at the bed of foundation, and this bed was placed 7 feet 8 inches below the general level of the ground about the structure. The foundation was 23 feet 4 inches thick, and was 58 feet 6 inches square at its top. It was built of large pieces of bluestone gneiss, put in the masonry as they came from the quarry, the interstices between the masses being filled with spawls and a mortar composed largely of fat lime and sand.

The shaft was commenced 55 feet 1½ inches square at the base, with walls 15 feet thick. These walls had a facing of large-grained white marble, in blocks of 2 feet rise and from 18 inches to 15 inches thickness, sawed without reference to the quarry-bed, and rubbed smooth, and a backing of blue gneiss-stone rubble. The walls as constructed contemplated a finished height of 600 feet for the shaft.

By the year 1854 the obelisk had been built to the height of 152 feet, and by 1856 some four feet more were added, making the height of the marble shaft 156 feet 4½ inches. At its top the sides averaged 48 feet 9½ inches in length. The well in the interior was 25 feet 1 inch square. The axis of the shaft leaned 1¼ inches to the northward. The thickness of the walls at the top was 11 feet 10⅝ inches. The weight of this obelisk and its foundations was some 31,152 tons, and the cost of the structure about 300,000 dols.

\* See illustration published last week.

On January 19, 1877, the Washington National Monument Society conveyed by deed all their property, easements, rights, and privileges in the monument to the United States, but no further work was done towards continuing the obelisk until 1878. Work was commenced upon the strengthening of the foundation, to the end that the obelisk might be completed to the height of 525 feet. This consisted in enlarging the area of the foundation by digging away 70 per cent. of the earth under the old foundation, and to a depth of 13 feet 6 inches beneath it, and replacing this earth with a mass of concrete extending 18 feet within the outer edges of the old foundation, and 23 feet 3 inches without the same line, thus giving a new foundation 126 feet 6 inches square, and enlarging the area of the foundation from 6,400 square feet to 16,000 square feet. To distribute the pressure of the shaft over this new foundation, the old rubble-stone base was torn from under the walls of the shaft, and replaced by a concrete underpinning extending out on to the new concrete slab. In this work 51 per cent. of the cubical contents of the old stone foundation was removed, and 48 per cent. of the area of the shaft undermined.

The work of strengthening the foundation was completed on May 29, 1880, and as finished the new foundation is 36 feet 10 inches in depth, and extends down to a level 6 inches below the permanent level of water in the site upon which the work is situated. The work of building the obelisk was commenced on August 7, 1880, the old shaft having first been reduced to a height of 150 feet; the masonry of the obelisk was completed December 6, 1884.

As finished the monument is 555 feet 5½ inches in height, the shaft being 500 feet 5½ inches high, and the pyramidion or apex 55 feet. The shaft as completed is 55 feet 1½ inches square at the base and 34 feet 5½ inches square at the top, where the walls have a thickness of 1 foot 6 inches.

Owing to the thinness of the walls of the shaft in their upper portions, additional care was taken in the construction of those parts, and between the levels 440 and 452 galvanised iron clamps were freely used. From the level 452 to 500 the walls are entirely of marble, of through-and-through blocks, and from the level 470, where the ribs of the pyramidion begin, the several courses are secured to each other by mortises and tenons cut in the builds and beds of the several stones.

The pyramidion is built entirely of marble, and its covering slabs are but 7 inches in thickness. Each of these slabs rests upon projections on the marble ribs. These ribs are twelve in number, three upon each side of the well, and spring from the interior face of the walls at the level 470. They are then carried upward, until the ribs nearest the angles of the shaft meet in the hips of the pyramidion, while those in the centre of each face are connected still higher up by voussoir stones, forming two arches intersecting each other at right angles. The thrust of a corner rib is transmitted to its opposite by the use of horizontal stones between their upper extremities. The weight of the pyramidion is 300 tons. The pyramidion is composed of 262 separate pieces of marble, containing 3,764 cubic feet of dressed stock. Marble slabs are fitted as shutters to the nine openings in the walls of the pyramidion.

The elevator columns of the iron framework were built to the level of 517 feet, permitting the elevator platform to be raised to the top of the shaft, while the four outer columns supporting the landings were terminated in the 500-foot platform.

The height of this shaft is slightly greater than nine times the width of the base. Its width at top is five-eighths of the width of the base, and it would come to a point at a height two and two-thirds its present height.

The walls of the new portion are faced with a fine-grained white marble from the Beaver Dam quarry in Baltimore County, Maryland, and backed with granite from several of the New England quarries. The courses are uniformly 2 feet in rise, the blocks of a wider bed than their rise, and the bond, the Flemish, alternate header and stretcher. The marble is very strong, fine-grained, and durable, and weighs 178½ pounds to the cubic foot. The walls at the level of 160 feet were reduced in thickness to 8 feet 7 inches, but from that level are carried up plumb on the inside, giving a well of 31 feet 5½ inches square.

An iron frame, supporting a staircase and elevator machinery, is carried from the floor to the top of the shaft. The weight of the structure is as follows:—

|  | Tons.  |
|--|--------|
| Weight of foundation and earth upon it . . . . .     | 36,912 |
| Weight of 150 feet of old portion of shaft . . . . . | 22,373 |
| Weight of new portion of shaft . . . . .             | 21,260 |
| Weight of pyramidion . . . . .                       | 300    |
| Weight of iron frame . . . . .                       | 275    |
| Total weight . . . . .                               | 81,120 |

It is quite certain the pressure upon the bed of foundation nowhere exceeds 9 tons per square foot, and is less than 3 tons per square foot near the outer edges of the foundation.

The lightning-conductors consist of a metal tip upon the

apex, connected by a copper rod with four other copper rods passing to the upper extremities of the four wrought-iron columns supporting the elevator machinery. The bottoms of these columns are connected by copper rods with the water in the well in the centre of the foundation.

The cost of the work to the present date is as follows:—

|  | Dollars.     |
|--|--------------|
| Expended by the United States . . . . .                  | 887,710 31   |
| Expended by Washington Monument Society, about . . . . . | 300,000 00   |
| Total . . . . .  | 1,187,710 31 |

"Antiquity after a time has the grace of novelty."—HAZLITT.

### THE RUINS AT CASHEL.

THE picturesque ruins on the Rock of Cashel, in the county Tipperary, have been restored by Mr. T. N. Deane, under the Commissioners of Public Works in Ireland, but the injury was allowed to go too far. The following interesting account of the remains was written by the Dean of Cashel, Dr. Cotton, in 1846:—

Almost every person who has cast his eye over any history of Ireland must have felt some degree of interest in the far-famed Rock of Cashel; and those who have visited the spot have generally found themselves well repaid by a view of the venerable ruins, towering proudly over the small town, which owed its trade, and indeed its very existence, to the religious and regal establishments anciently connected with that rock.

It is not surprising, therefore, that a considerable sensation was created throughout Ireland about three months ago, on seeing in the public papers a brief and not very intelligible announcement, that "the Rock of Cashel had fallen!"

To those persons who are totally unacquainted with the locality of Cashel, it may be necessary to state that the real "Rock" is an elevated, detached mass of stratified limestone; conspicuous for many miles around, more especially in the directions of north and west. The tradition of the neighbourhood reports that it was deposited in its present bed by Satan, who had bitten it out of the mountain range called Sliabh Bloom, in the northern part of the county Tipperary, at a spot where a large gap is still to be seen in the outline of the ridge, which is universally known by the name of "The Devil's Bite." St. Patrick, the titular saint of Cashel, observing the fiend flying over with this heavy mouthful, compelled him to drop it where it now remains, and forthwith consecrated it to pious uses.

It might, perhaps, be thought rather unfortunate for the credit of this story that the mountain from which this "bite" was filched is not composed of limestone. But that trifling circumstance was overlooked in times when geology was not so fashionable a study as at present; and surely, whether the change was brought about through the power of the saint, or from the natural heat of the carrier's stomach, it only makes the *miracle* the greater, and adds dignity to the tradition.

Upon this rock has been erected at different periods—(1) a round tower, which is still entire; (2) a small, but beautiful stone-roofed church, of what is usually called the Norman style of architecture, built in the early part of the twelfth century by Cormac M'Carthy, King of Desmond, or South Munster, and still familiarly known by the name of Cormac's Chapel; (3) occupying the whole space between those two buildings, and, as it were, embracing them, stands the larger church or cathedral, which was erected about the year 1169 by Donald O'Brien, King of Limerick. The Round Tower and Cormac's Chapel are built of brown gritstone, which must have been brought from a distance of six or seven miles; the cathedral, of Pointed architecture, is composed of the limestone of the neighbourhood.

There are also upon the rock the remains of another later building, generally supposed to have been the common hall of the vicars-choral; and at a small distance from the church, on the south-west side, stands a curious cross, formed of gritstone, judged to be coeval with Cormac's Chapel.

The ecclesiastical establishment at Cashel shared the vicissitudes of fortune common to all parts of Ireland during several centuries, in which the old annalists represent the country as being in an almost perpetual state of warfare. Churches and monasteries were generally considered to be the depositories of valuable property, and therefore became special objects of pillage to the contending parties. The annals of those times are thickly studded with quiet, pithy notices, such as "the

church of — was plundered"; "the monastery and church of — were burned."

It is recorded that Cashel underwent *one* of those frequent visitations from a very singular motive. An Earl of Kildare, in the year 1495, set fire to the cathedral; and coolly gave as his reason and justification, "that *he thought the archbishop was in it at the time.*"

Cashel, being likewise a regal residence and important military position, was often exposed to sieges and hostile attacks. The rock, which in some parts is naturally almost inaccessible, was strongly fortified by art. The walls of the cathedral were thick and solid; and at its western end, instead of the usual long nave, great western door, and ornamental window, there was built a massive square guard-tower of great height, resembling the fortified castles which are common throughout the kingdom. This contained a large, high, vaulted apartment, having no exterior windows, and a small and strong entrance. Over this vault, and approachable only by stairs within the thickness of the walls, of width barely sufficient to admit a single person, was the chief state-room or hall; and above this were some smaller apartments, with a roof surmounted with battlements and a parapet. A few windows, of various shapes and irregularly placed, gave light to the upper portions of the building.

It is beyond question that this tower was erected for purposes of defence, and probably it was always furnished with a garrison. The latest period at which we have any account of hostilities taking place on this spot, is the year 1647, when it was besieged by Lord Inchiquin and the parliamentary forces, and after a severe bombardment was taken by storm. The buildings suffered much damage from the cannonade; and after the capture of the place, the victors blew off the roof of the cathedral with their cannon. The western tower, which was directly exposed to Lord Inchiquin's battery, was greatly shaken. A large crack, running from top to bottom of the centre of its western face, and which has been distinctly visible during a great number of years, may perhaps have originated in some settlement of the foundation, but probably was much enlarged by injuries received on this occasion.

After the troubles of the Commonwealth had passed, the choir of the cathedral was used for divine service, and so continued till the year 1749, when Archbishop Price, being desirous that the parishioners should have a place of worship less exposed to storms of wind and more accessible to the aged and infirm, caused St. John's Church, within the town, to be made cathedral as well as parochial, and transferred the congregation to that church.

Since that time, "the old Rock" (as it is called by all the people of the neighbourhood), has been left to itself. The Round Tower still stands in its simple dignity, uninjured. Cormac's Chapel has suffered comparatively little damage, except from the lapse of time and some injudicious "adaptations" made while it was garrisoned by troops. But the "cathedral," having become roofless and exposed to the weather of all seasons, has owed its present condition of tolerable integrity chiefly to the solidity of its walls and the goodness of its masonry.

The debris of the roof had accumulated to a great height within the church, burying beneath them tombstones, fragments of windows, capitals, corbels, &c., and, being covered with long waving grass, presented a sad picture of desolation. Some years ago this rubbish was removed; the whole place was cleaned; the level of the original floor was reached; the bases of the four fine pillars supporting on arches the central tower were exposed to view; and the just proportions of the edifice were shown. Some interesting tombstones also were uncovered, but the greater part of them were broken in pieces. However, the fragments were carefully collected, and joined together as well as circumstances would admit.

The lower stone-roofed vault in the western tower, having had its few apertures closed up, had become a chamber of darkness. Not a soul resided on "the Rock." The memory of their forefathers, who had been slain by Lord Inchiquin's troops, was still fresh and festering in the minds of the townspeople, and the spirits of the dead were believed to haunt the scene of their former struggles, in confirmation of which belief strange noises were reported to be heard at night, and mysterious glimmerings of light were occasionally seen to issue from the deep recesses of the western tower.

About twenty-two years ago, when, in the process of clearing away the accumulation of rubbish which disfigured all parts of the church, I came to remove the heap which lay on the floor of this vault to the depth of several feet, I unconsciously interfered with this traditional tale. Not that I encountered ghosts, or any hostility from them; but, concealed under the rubbish, I discovered the remains of a *coiner's forge*, coals, cinders, &c., and have some of the base metal found there in my possession at this day.

Here was a pretty *éclaircissement* of a long-believed legend! Here we had one of the thousand instances in which superstition is befooled by knavery, and the credulity of the un-

reflecting masses of our countrymen is traded on by unprincipled adventurers. At the very time when those forgers of base money were encouraging the religious alarms of the inhabitants of Cashel, they were carrying on their thievish trade uninterrupted, and probably were daily trafficking and cheating those very people with that counterfeit coin.

It had long been observed that the crack in the western tower was widening, and appeared to threaten a serious rupture. At length, on the morning of February 22, 1848, a violent storm of wind so shook the building that the tower parted in two from top to bottom, and the southern portion fell to the ground with a terrific crash. The excellence of the mortar which had been used in the building was now shown most conspicuously. The wall fell in large masses, several of which still remained firmly cemented together (as is seen in the fallen tower of Conway in North Wales, and in the ruins of many other ancient castles in Ireland and England). Many stones were broken in two pieces by the shock, each piece remaining firmly imbedded in its mortar. One large mass, ten or twelve feet in length and four or five feet high, which includes part of the parapet, and therefore must have fallen from the greatest height, appears to have glided down without turning over or altering its position, and now stands upright and entire in the churchyard, immediately under the spot which it formerly occupied.

By this accident the interior of the lower vault and of the hall above it is exposed to view from the south. A small but rather elegant window in the upper part of the building has been destroyed; and the heavy masses of stone in their descent overwhelmed the projecting southern porch, which, together with a guard-room over it, has been almost totally demolished.

All this mischief was not done at the same moment. Part of the building fell several hours before the rest, and having thus loosened the general bond of cohesion, prepared the way for a second fall, and many of the adjoining portions now appear to hang together so loosely and imperfectly that still further damage may be expected to follow, unless timely means be taken to prevent such a misfortune.

As might naturally have been expected, the most lively interest was excited throughout the neighbourhood. Thousands flocked to the spot as soon as the news of the accident was spread abroad; great sorrow was expressed; tales of all sorts were told; the prophecies (always abundantly to be had in Ireland when wanted) were raked up for the occasion. People could not help noticing that the day of this disaster was the day on which the Revolution in Paris broke out; and somebody immediately recollected an ancient prophecy of some wise man or woman, declaring "that there would never be a successful rebellion in Ireland till the Rock of Cashel fell."

## BUILDING IN LEEDS.

THE Building Clauses Committee of the Leeds Town Council have issued the report of Mr. D. Hainsworth, inspector of buildings, for the year ended October 31 last. The total number of plans presented to the committee was 1,668, of which 1,340 were approved and 328 rejected. The total number of buildings shown in the plans was 4,487, of which number 3,780 were approved and 707 rejected. In the preceding year 1,626 plans were presented, 1,294 being approved and 332 rejected. The number of buildings shown upon such plans was 4,502, 3,935 being approved and 567 rejected. Twenty-four miscellaneous plans were presented, in respect of two churches, three additions to churches, three chapels, two additions to chapels, one mission-room, one addition to mission-room, five schools, six additions to schools, and one addition to the Yorkshire College. During the present year 1,030 houses had been completed and certified for occupation; also 1,101 miscellaneous buildings had been completed and certified. During the year 1883, 1,007 houses were completed and certified for occupation; also 1,245 miscellaneous buildings were completed and certified. There had been one conviction during the year for infringement of the law.

## COLOUR DECORATION.\*

I WILL now, with your permission, without going into the subject too deeply, briefly describe some of the general principles which hold good in any scheme of colour decoration, and in doing so I must waive any claim to originality for the statements made, as the information has been chiefly culled from the works of Owen Jones and Chevreul, whose treatises on colour are still considered standard authorities. It may be assumed in the first instance that the decorative arts have their origin in architecture, and that they should, if used properly, be associated and allied with it. In order to secure true

\* From a paper by Mr. W. H. Thorp, architect, read at a meeting of the Leeds and Yorkshire Architectural Society.

beauty, which is largely dependent upon the satisfaction which the cultured mind feels in the contemplation of any work of art, it is necessary that all decorative arrangements should possess due proportion, fitness, and harmony, which are productive of repose.

Another maxim, familiar to all of you, which is equally applicable to architecture as to the decorative arts, is that a design should be first constructed and afterwards decorated—the reverse process never being resorted to. We are told that on the question of general form beauty is produced by lines growing out one from the other in gradual undulations without excrescences, and that the design, when completed, should be so arranged and distributed that nothing could be added to it or taken away from it without impairing its general effect. Attention having been paid to the general form of the design, it may then be elaborated by means of subdivisions, and the spaces filled in with ornament, these being again further subdivided and enriched, the ornament based upon a geometrical construction.

A true proportion must always exist in every assemblage of forms used throughout the decorative arts, the whole and each individual number being a multiple of some simple unit; and it will be found by actual experience that these proportions increase in beauty as they are more difficult to detect, the more subtle ratios being more pleasing than the simpler ones. The harmony of form to be found in a design depends upon the balancing of the straight, inclined, and curved. A practice which obtains in Oriental work, and is equally applicable to work of all periods, is that in surface decoration there should be a parent stem, from which all lines should radiate, and that ornaments should never be detached, but should in all cases be traced to their parent stems and roots.

As an application of the foregoing rules we will take a modern piece of wall-paper of good design, well covered with ornament of the type commonly known by the name of an all-over pattern. In looking at it in the first instance we notice that breadth of treatment and harmony of tone which is productive of repose, and gives us thereby a sensation of beauty. It is only when we approach nearer and examine it more closely that we observe the principal features of the design, and are enabled to analyse it into its constituent parts. We shall then by careful examination probably notice the construction of the design, and detect the leading lines from which the lines of lesser importance are evolved and radiate. The geometrical construction of the design now being exposed, it is easy to see by what means the general proportion of form has been obtained, and how the whole and each feature is a multiple of some simple unit. If breadth of treatment is aimed at, the straight, inclined, and curved lines will be so balanced in due proportion one to the other as to avoid horizontality of effect on the one hand, and verticality on the other.

It now only suffices to notice how the constructive lines are enriched and the interstices filled in with ornament, the same rules applying to the lines of the ornament as to the constructive features of the design.

Natural forms, such as flowers and foliage, where used for ornament, should not be reproduced as nearly approaching the originals as possible, but they should be conventionalised in their general forms and outlines, in such a manner as to suggest the objects they are intended to represent without impairing the unity of the design in which they are introduced. In all the best periods of art this precept has been obeyed; and where a tendency towards a copyism of natural objects in their exactitude exists, it is indicative of a decline from previous standards of excellence.

In the development of form colour is a valuable adjunct in lending its help for the purpose of distinguishing objects, or portions of objects, one from the other; and it is also of assistance in obtaining the desired effect of light and shade. To obtain these results the primary colours should be used with a sparing hand in small quantities, and they should be balanced by a more liberal use of the secondary and tertiary colours spread over larger surfaces. There are three primary colours—namely, yellow, red, and blue—and these, when used in equal intensities, will harmonise with one another in the proportions of three of yellow, five of red, and eight of blue. The secondary colours are combinations of the primaries, namely, orange, purple, and green; and the tertiaries—citrus, russet, and olive—are compounds of the secondaries. Both the secondaries and the tertiaries, where used together, must, as well as the primaries, be applied in such proportions as will harmonise or neutralise each other. When mixed with white each colour has a variety of tones, and when with black or gray a variety of shades. By admixture with other colours in addition to white, black, and gray, each colour has a variety of hues, and each of these has its numerous tones and shades.

It is desirable that when a full colour is used in contrast with another of a lower tone to increase the volume of the latter proportionally in order to balance the former, and when a primary tinged with another primary is contrasted with a secondary, the latter must have a hue of the third primary.

When moulded surfaces are decorated with the primary colours, blue, which recedes, is most suitable for concave surfaces; yellow, which advances, for the convex; and red, the intermediate colour, for the undersides; white being used in the vertical planes to separate the colours.

One or other of the primary colours, either in its natural state or in combination with some other colour, should be present in every composition; and in every decorative arrangement the colours should be blended in such a way as to result in perfect harmony and rhythm.

According to Chevreul, if you place two tones of the same colour in juxtaposition, the light colour will look lighter and the dark one darker; also, when two different colours are placed side by side, they each are modified in two different ways, firstly as to their tone (the dark colour appearing darker and the light one lighter), and secondly as to their hue, when it will be noticed that each is tinged with the complimentary colour of the other.

In any coloured design on a white ground the colours will appear darker, and if on a dark ground they will appear lighter.

Vivid colours should never be allowed to impinge upon one another, but they should be separated by lines or belts of colour of a neutralising tendency.

A practice which obtains in decorative work of Oriental origin, where coloured ornaments are drawn upon a ground of a contrasting colour, is to separate the ornament from the ground by an edging of lighter colour.

Where ornaments in any colour are used on a gold ground, it is well to emphasise the ornament by outlining it with a darker edging; and where ornaments of any colour are used on grounds of any other colour, they may be separated by edgings of white, gold, or black.

In the case of coloured ornaments or designs in gold being used upon white or black grounds, they do not require to be outlined, and this rule holds good when a light tint, shade, or tone of colour is used upon a ground of the same colour. Another rule which I have found to work well from experience, and I will conclude this section of my paper. In any scheme of colour of wall decoration, for example, it is well to keep the darker shades of colour for the lower portions of the walls, and let the colour get lighter as you ascend towards the ceiling. Avoid top-heavy effects. Avoid the use of too large a variety of colourings productive of parti-coloured effects, which are conspicuous by their absence of repose. Some of the most successful examples of colour decoration have been produced by the simplest means. Where possible try and repeat the prevailing tints of the dado and wall surface in connection with the colours of the frieze, cornice, and ceiling. They must be used in a subordinate capacity, but when introduced with artistic judgment they fulfil the object of binding the whole of the design together, and produce the breadth, unity, and rhythm of effect which alone can give us that æsthetic satisfaction which the contemplation of a beautiful work of art produces in our minds.

We have now arrived at the last portion of the subject which has engaged our attention this evening, and mention must be made of a few recent examples of decorative work, with some reference to modern materials of an artistic character which may be applied as useful adjuncts in the carrying out of schemes of colour.

We will take in the first instance, as an example, a residence in the neighbourhood of Leeds, in which I was engaged to design the decorations of the entrance hall, corridors, staircase, and dining-room. The drawing-room and library had already passed through the decorator's hands, the decorations being elaborate in character, of a modern French type. The house in itself is a plain stone-built residence, with some recent additions, possessing no special claims upon attention with regard to its architecture—its characteristics being more of the Classical than the Gothic school. My client's tastes leaning towards elaboration of treatment, it seemed best to adopt the Italian Cinque-Cento style of colour decoration as a basis to work upon.

We will commence with the dining-room, a large oblong apartment, well lighted at the end by a projecting bay of several lights. The plaster-work of the ceiling was completed, and comprised the usual cornice with two or three orders of enrichments and an elaborate ornamental flower in the centre. A grate enclosed within a dark marble chimneypiece was in position, and these must not be disturbed.

The first thing to do was to divide up the wall surface into three divisions—dado, intermediate wall space, and frieze; the dado and upper wall surface being separated by means of a carved walnut surbase moulding, and the frieze from the wall below by a brass picture rail and two or three horizontal lines of strong colour and gold.

The dado was then covered with "Lincrusta-Walton," which, as you will all be aware, is a species of linoleum with patterns in relief stamped upon it. The pattern selected in this instance was a kind of Italianised linen-fold panel arrangement, which

was painted a bluish-grey, the vertical lines of the design being emphasised by means of a little gold.

The next surface to treat was the intermediate wall space between the dado and frieze. As it was intended to cover nearly the whole of this wall with large oil paintings, and knowing the value of a good background, I followed the example set at the Royal Academy and Grosvenor Gallery, and had it painted in shades of Indian red with a purply bloom. A diaper design, somewhat after the manner of those decorative hangings and altar frontals, as seen in the pictures of Paolo Veronese and other Italian artists, was introduced, the pattern being in a light shade on a darker ground. This was effected by means of stencil-plates, and was touched up by the hand afterwards. To meet the wishes of the head man of the decorative staff, who had seen considerable experience with Messrs. Crace, of London, by the adoption of an ingenious process a tapestry effect was given to the ornament.

In the frieze a running design, in which festoons, medallions, shells, and cornucopia were introduced, was adopted, the ornament being painted in a brown-pinkish red, relieved with gold upon a delicate grey-blue ground, the two prevailing colours repeating to some extent in paler tones the colours of the dado and wall surface below. These colours in stronger shades were repeated in the cornice, and neutralised together by lines of grey and cream white, and a liberal use of gold.

The ceiling must next be described. It was in the first instance divided into three compartments, the middle one containing as its chief feature the plaster centre-flower. The compartments were divided one from the other and from the cornice by broad belts of ornament, knots of fruit and foliage, banded together with ribands painted and shaded in French grey on a pale-russet ground, forming the central design of the bands. Each compartment was again sub-divided into further geometrical divisions, and their borders ornamented by strings of husks, shaded in pale grey-blue upon a purple madder ground. In each of the end compartments, three panels, and in the central one, four panels, were singled out for elaborate decoration, and were filled in with arabesque compositions of a Renaissance character in various colours enriched with gold upon a cream-coloured ground. The subordinate panels were treated as before with a cream-coloured background overspread with a conventionalised olive-spray pattern; the leaves painted a grey neutral green, and the berries in low-toned reds.

Leaving the dining-room, the entrance-hall, corridors, and staircase must next be noticed. In all of these departments of the house the treatment of the wall surface was the same. The surbase mould, or chair rail, was dispensed with, and the division between the dado and the upper wall space marked by a band of ornament in cinnamon browns and blue shaded with grey on a dark red ground, enclosed within line borders of red, brown, and gold.

The wall surface, like that of the dining-room, being in demand for pictures, was painted a salmon-hued Venetian red in plain colour, without any ornamentation; whilst the dado below was covered with a geometrical pattern in two shades of sage green, divided up with gold lines.

On account of the want of height prevailing in these portions of the house, a very narrow frieze was only permissible. This was ornamented with a repeated pattern of semicircular medallions, filled in with radiated readings in blue-grey on a dark brownish-red ground, and the spandrels between treated with conventionalised foliage in brownish-pink on a saffron ground, the whole being enclosed top and bottom with lines of dark red, brown, and gold.

The decoration of the hall and corridor ceilings is of a very simple character, and yet, in spite of its simplicity, it is the most pleasing example of colour in the house. Above the cornice a border runs round the ceiling, with a vellum ground, and ornamented with a continuous spray of olive; the leaves a greyish-green and the berries crimson. The central spaces of the ceilings were then covered with a geometrical pattern of rather intricate design, the prevailing colours being cinnamon brown and gold upon a vellum ground.

The decoration of the staircase ceiling slightly differs from the foregoing, the geometrical pattern being of a different design, and its prevailing colour a blue grey instead of cinnamon brown, the background being vellum as before.

If in a former part of my paper I could not see my way to recommend very strongly the use of glazed materials for exterior application to buildings, there is no drawback to stand in the way of my warm advocacy of the merits and capabilities they possess for interior decoration.

There are two firms whose success in this particular department of work places them in the first rank, and gives them a premier position over other makers who are endeavouring to follow in their footsteps—viz., Messrs. Wilcock & Co., of Burmantofts, and Messrs. Doulton, of Lambeth.

By permission of Mr. James Holroyd, of the former firm, I am enabled to give you descriptions of two or three enterprises of importance where this material has been successfully used, and has called forth a large amount of admiration. It

has been in large demand for hotels, clubs, and restaurants, on account of its pleasing decorative effect, combined with its cleanliness and capacity for reflecting light, and it is in some of the best known resorts of this class in London that it is to be seen to the greatest advantage. Among them may be mentioned the Auction Mart Restaurant, First Avenue Hotel, Yorkshire Grey Restaurant, new dining-room at the Liverpool Street Station, and the Circus Restaurant. It has also been applied with success in the lecture-hall and the new dining-room of the St. James's Hall, London, and is to be introduced largely in Milling's new restaurant, Bear Lane, in the same city, and in Manchester the new Victoria Hotel will owe some of its interior decorative effects to the adaptation of this useful material.

#### Completion of the Houses of Parliament.

SIR,—Under your column of "Bygones," I see you have reprinted last week my father's original description—written in 1836—of the principles in which he had conceived and laid out his design for the New Palace at Westminster, which gained for him that great work. It is interesting to see by comparison with the work as executed, how persistently he kept his original ideas and arrangements in view during the many years the work was in hand.

It will be equally interesting to your readers and only fair to Sir Charles Barry to add his reports, written in 1853 and 1854, and made to the then First Commissioner of Works, Sir William Molesworth, since in it he gives his proposals of how the building ought to be completed on the land side when opportunity should permit.

He therein gives his opinion as to the fitting treatment of Westminster Hall as a part of the great building, a matter of interest at this moment, when a committee is sitting and considering a different and (as I venture to think) an unsuitable and inharmonious treatment.

This proposal by Sir Charles is contained (with illustration) in a Parliamentary paper, No. 333, of June 21, 1855, of which I have the pleasure to enclose you a copy.

I Westminster Chambers : Yours obediently,  
March 16, 1885. CHARLES BARRY.

The following letters, extracted from the Parliamentary paper referred to in Mr. Barry's letter, will explain the consistency of the late Sir Charles Barry :—

Old Palace Yard, December 19, 1853.

SIR,—In compliance with the instructions contained in your letter of August 18 last, relative to the works required for the completion of the New Palace of Westminster, I beg to inform you that I have given the subject much consideration, and I now enclose a plan illustrative of the additions which I deem to be necessary for completing this great national work in a fitting and proper manner.

I propose, as the plan demonstrates, that New Palace Yard should be enclosed on the north and west sides, and thereby form part of the New Palace as it did of the Old Palace at Westminster, and that the principal entrance for the public should be at the north-west corner of this proposed new quadrangle; that the new building forming the west side of the quadrangle should be continued southwards until it joins the existing building of St. Stephen's Porch, thereby forming a façade to St. Margaret Street and Old Palace Yard, with the convenience of a covered footway throughout the whole extent of it. By means of these additional buildings, the irregular, disjointed, and incongruous character of the present building on the land side would be removed, and a degree of unity would be given to the New Palace on that side in harmony with that already obtained on the river side, and the principal entrance to the Palace would then be a marked and important feature of the building. The effect of these additions also would be to appropriate to useful purposes the waste but valuable space which now not only produces no effect in itself, but injuriously affects the appearance of the New Palace. I now proceed to enumerate the purposes to which the additional buildings might be appropriated, under three heads, as requested in your letter.

1. With reference to the transaction of the business of Parliament, the proposed buildings might contain extra committee-rooms, which, notwithstanding the great number provided in the existing building, have been, and are likely to be,

to a greater extent than heretofore required during busy sessions of Parliament. They might also accommodate several of the public offices, afford rooms for commissions, official residences (if considered desirable), and other accommodation required for Government purposes. Accommodation might also be provided at the south-west angle of New Palace Yard for the stabling and State coach of the Speaker, &c.

2. With respect to accommodation which, although not necessary for the transaction of the business of Parliament, has hitherto been provided for in the Palace of Westminster, namely, the Law Courts, I beg to state for the accommodation of these courts, at least twelve in number on one floor, and lighted from above, together with adequate accommodation for the judges, for counsel, and for the public, the space which could be appropriated for the purpose would not be more than one-fourth of that which would be requisite. The present Law Courts are insufficient in number and size, and some of them, which are only temporary, are placed in upper floors, where they are found to be extremely inconvenient. The rooms for the judges, for the bar, for juries, and for the public generally, are also insufficient in number and size, defective in the mode of lighting, and ill-arranged. In short, the want of space in the present Law Courts, and the inconvenience of their locality, are loudly and very generally complained of.

3. The alterations in the vicinity of the New Palace that would be consequent upon the additions proposed to be made to it, and the erection of the New Westminster Bridge, would be the entire removal of the block of houses on the south side of Bridge Street, and of the Law Courts buildings on the west side of Westminster Hall; and for the sake of the effect of the New Palace as a whole, in conjunction with Westminster Abbey; the removal of St. Margaret's Church, as recommended by a Committee of the House of Commons, would be highly desirable.

The amounts of my estimate of the cost of the several proposed additions to the New Palace under heads as requested, are as follows:—

|   |          |
|---|----------|
| 1. Building on the north side of New Palace Yard  | £67,295  |
| 2. Building on the west side of New Palace Yard, including the entrance gateway                                   | 79,052   |
| 3. Building forming the centre of the fronts towards St. Margaret's Street, and southwards to St. Stephen's Porch | 102,594  |
| 4. Building in the proposed new quadrangle of New Palace Yard, west of Westminster Hall                           | 13,994   |
| 5. The Speaker's stables, &c.   | 3,266    |
| 6. Alterations of the front of Westminster Hall   | 12,085   |
| Total   | £278,286 |

The buildings comprised under the heads No. 3 and 4 could not be erected until the Law Courts are removed from their present situation.—I am, &c., (Signed)

T. W. Philipps, Esq.

CHARLES BARRY.

Westminster, June 28, 1854.

SIR,—In reply to your letter of the 10th inst., I beg to acquaint you that I was induced in my report to the Board of December 19 last to take the view I did of the Board's requisitions of August 18, 1853, in consequence of having already furnished estimates, which have been submitted to Parliament, of the cost of all the works which have been sanctioned in respect of the New Palace at Westminster.

Having now, in compliance with the request contained in your letter of the 10th inst., made a careful estimate of the works still to be executed in completing the New Palace, as far as its design has been already sanctioned, I beg to acquaint you that it amounts to 280,272*l.*, a detailed abstract of which I send enclosed. If this amount be added to the amount of the estimate which I forwarded to the Board on December 19 last, for works proposed but not yet sanctioned, together with an allowance of 25,000*l.* for the cost of raising the roof of Westminster Hall, and of various alterations consequent thereon which was not included in that estimate, the Board will be in possession of the gross estimated cost on March 31, 1854, of all works, sanctioned as well as projected, for completing, fitting, furnishing, decorating, and rendering fit for occupation the New Palace, including the architect's commission and all other incidental charges, amounting in the aggregate to 583,557*l.*

The gross amount of the cost incurred on March 31, 1854, for works already executed at the New Palace at Westminster, including fittings, fixtures, furniture, and decorations, as certified by the architect, and including also his own commission and all other incidental charges, amounts to 1,583,289*l.* Thus, taking into account other amounts already expended on the works, and the estimated cost of works sanctioned, as well as those which have been proposed in further extension of them, the total cost of the New Palace would not exceed the sum of 2,166,846*l.*—I am, &c., (Signed)

To W. Philipps, Esq.

CHARLES BARRY.

Westminster: July 12, 1854.

SIR,—I have to acknowledge the receipt of your letter of the 6th instant requiring information as to the time that would be requisite for the completion of the whole of the works sanctioned, as well as projected, in the New Palace at Westminster, upon the assumption that a vote were taken for the full amount of my estimate of the cost of these works, and no delay occurred in issuing the funds required for that purpose.

If that further portion of the site, now covered by the houses on the south side of Bridge Street, could, as it possibly might, be cleared and obtained within two years from the present time, and if the sittings of the Law and Equity Courts at Westminster could be discontinued, and the site of them cleared and obtained within the next twelve months, I am of opinion that the whole of the works of the New Palace might be brought to a close within four years and six months from the present time, and that an annual expenditure of about 120,000*l.* might, upon an average, be safely and profitably incurred upon such works during that period. As, however, the site of the projected building on the west side of New Palace Yard, proposed for public offices, &c., is now available, that portion of the proposed addition to the New Palace might, if commenced immediately, be completed and rendered fit for occupation within two years and six months from this time.

I have ventured to suppose it possible that the sittings of the Law and Equity Courts at Westminster could be discontinued upon the assumption that those sittings might in future be held in the City and Lincoln's Inn, until the great question of the final location of those courts is determined upon and the requisite accommodation provided for them.—I am, &c.,

(Signed) CHARLES BARRY.

T. W. Philipps, &c.

#### Arsenic and Architects.

SIR,—It seems that I incautiously provoked Sir E. Beckett to pen a trenchant letter on the poisoning of church rats and church-goers with arsenic. My reply not having appeared, it has been surmised that he "has come off first best in the encounter," which left him fully armed, and master of the field, in the *Times* of February 21. It must be confessed he had the best of it in respect of time and chance. And his letter has been quoted in other papers. But "he lives to fight another day," for somehow the opportunity of receiving any response to the sarcastic challenge which he valiantly threw out to me, or to other architects who might be supposed to be implicated in the use of arsenic under floors, was not there vouchsafed to him. The sarcasm, in good truth, becomes amusing when he supposes that I necessarily advocate or even defend the use of arsenic, if I venture to suggest a little scientific study as to its application, not for his own sake, but for the sake of his brother chancellors; and this, whether he considers most of them, or only a few, to be noodles like the whole body of architects. The study would certainly lead them to prefer its use, even "in solution from a watering-pot," beneath a well-constructed floor, to their having it in constant contact in wall-papers, carpets, curtains, or clothes. But, at the same time, it would unquestionably teach them that it ought on no account to be used unless effectual precautions are taken against its coming into contact with moist vegetable matter, such as timber or fungoid growth in a damp or insufficiently ventilated space, and notably so beneath a church floor—rather a crux, perhaps, in some instances. The affinity of arsenic to hydrogen is so strong as to produce dangerous results in the shape of arsenical vapour, which is, I believe, many thousands of times more injurious than an equal quantity of arsenic in any other form. I ought to add, I have never specified or recommended its use in any of my works. I have made use of ground lime and lime wash, sulphate of iron and sulphate of copper. Corrosive sublimate is by many persons considered the best preparation for surface application. All these are free from the special dangers inseparable from the use of arsenic. The charging of wood under a vacuum, as suggested by him, is quite another matter. But for this purpose copper and iron will be as good as zinc; and even zinc, while preserving softer wood charged with it, has failed in the case of oak. But this is not the contention here.

As to Sir Edmund's useful little book on building, he need not be afraid lest architects should estimate it at less than its true value. But he is much mistaken in supposing that they have any fear of its being likely to supersede their office or their art. The old proverb that "when a man becomes his own lawyer, he has a fool for a client," has been found quite as true in, and just as applicable to, the case of a man becoming his own architect. An architect commonly prefers even a contract to come under the control and responsibility of the lawyer. Still, even lawyers, like doctors, cannot always treat their own case successfully. They are apt to be too sanguine and self-confident as to the correctness of their own opinion. And men who have acted as their own architects have been found to leave

ample scraps for the builder and the surveyor, not to mention the lawyer; but to produce uncommonly little for the artist.

Your obedient servant,

WILLIAM WHITE, F.S.A.

30A Wimpole Street, W.

#### The Floral Hall Exhibition.

SIR,—In your notice of exhibits in *The Architect* of 7th inst., you say the whole of the stone in the spire of St. Peter's Church, Bournemouth, was from the Corsham Down quarries of Messrs. Stone Bros. I shall feel obliged if you will, in fairness, correct the same by stating that the base and top part of this spire, to the extent of over 2,000 cube feet, was built from the Monk's Park Bath stone, of which quarry I am exclusive proprietor, and was specially selected on account of its great weight, carrying, and weathering properties. The gate piers and entrance is also from the same quarry.

Yours truly,

Bath: March 17, 1885.

ISAAC SUMSION.

SIR,—We wish to correct an inaccuracy in your last week's notice of our exhibit at the Architectural Exhibition, wherein you say that the "whole of the stone in the spire of St. Peter's Church, Bournemouth, is of Corsham Down, from Messrs. Stone Bros. quarries." We have, however, been informed to-day by the builders that the 7,166 cube feet of Corsham Down we supplied for this spire was not the *whole* that was used but *three-fourths* of it, a neighbour of ours having supplied the remaining fourth. You will much oblige us by inserting this correction in your next issue.

Yours truly,

Bath: March 13, 1885.

STONE BROS.

#### Sedimentary v. Igneous Building Stone.

SIR,—Mr. J. Slater's paper, and Mr. H. Travis' letter, in your issue of 14th inst., should surely convince architects who look to anything beyond the momentary appearance and present lower cost of the buildings they erect, that true economy and their clients' best interests demand the use of stone that will resist the ravages of the vitiated atmosphere of our manufacturing towns and cities, in most of which all over the country may be seen buildings (erected some of them but a very few years) with arrises, mouldings, and projections quite eaten away or crumbled to dust. The proper material for all buildings intended to last twenty years and upwards is granite, as it is also the most beautiful. It can be used either as random rubble—facing or solid, according to cost of conveyance from quarry—with cut granite dressings; as rough or rock-faced coursed work, or in dressed form, "picked and margin draft," "axed," "fine axed," or "patent axed," according to height from eye or money that can be spent. Then in addition to mouldings (which should be as far as possible bold rather than intricate), the architect has polishing at his disposal for ornamentation, as for pilasters, plinths, columns, &c. For good effect in the two latter I refer him to the new Post Office, Belfast, which we have just completed. He can also gain the effect of carving at a fraction of the cost by incising deeply on polished surface, and the effect in friezes, bands, caps, &c., is exceedingly good.

Briefly, in the hands of an architect who will take the trouble of studying the material, granite is capable almost of anything both in effect and cost. If you desire it, I will have a little town hall, just being completed here, photographed for you to show the simplest form of granite building in combination with some of the more expensive; and if any of your readers are really desirous of taking the matter up practically, and make trial of granite, I will be glad to give any advice or answer any questions on the subject. Some years since I advocated its use in your columns, after visiting the United States and seeing the magnificent granite buildings there. And on a more recent visit I found the use of granite rapidly extending. Let some of your subscribers go out there for their holidays this spring, and they will become as warm advocates of granite *v.* everything as—Faithfully yours,

THOS. M. H. FLYNN.

Bessbrook Granite Quarries, Ireland.

**The Patent "Premier" system of wood-block flooring** of Messrs. Geary & Walker, of 7 John Dalton Street, Manchester, has been adopted for the new Industrial Museum of Science and Art Buildings, now being erected in Edinburgh under the superintendence of H.M.'s Office of Works, Edinburgh. It has recently been laid at the new Bromley and Beckenham Joint Hospital; H.M.'s Post Office, Leeds; Bodega, Birmingham; St. Patrick's Training College, Dublin; Macclesfield parish church; basement to offices, Liverpool; cotton mill, Ashton; church at Middleton; The Uplands, Brighton, for Mr. P. A. Taylor, M.P.; church at Exeter; church at Crewe; schools at Swindon, and other places.

## LEGAL.

### Belper County Court.

Before JUDGE WOODFORDE.

KENT *v.* MANNERS.

ARCHITECT'S FEES.

The plaintiff in this case was an architect living at Derby, and he sought to recover twelve guineas from Wm. Manners, of Cotmanhay, Ilkeston, for work done in the preparation of plans and specifications. There was a set-off for 18s. 6d. which was not disputed. The plaintiff prepared some plans for building operations and alteration to premises. Evidence was given showing that the work was reasonably charged for, and that the plans were worked upon to some extent. Defendant's solicitor denied this, and called upon witnesses to show that the plans were not used, as they arrived too late. His Honour said he did not think the plaintiff should have his brains picked for nothing, and gave a verdict for 7l.

## CHURCH BUILDING AND RESTORATION.

**Farnworth.**—A meeting of parishioners has been held for the purpose of approving designs for the formation of a baptistry in the parish church, the erection of a new font, and also of designs for a stained glass window in the baptistry and the erection of a reredos. The vicar said that the plans had been approved by Chancellor Christie upon the condition that they were submitted to and approved by a meeting of the vestry. He then submitted the plans of the font, which had been designed by Mr. R. K. Freeman, F.R.I.B.A., of Bolton. The font will be of Gothic design, in harmony with the pulpit, and it is proposed to carve it from Alderley Edge stone. Dr. Kershaw intended to place the stained glass window in the baptistry in memory of his wife. The reredos had also been designed by Mr. Freeman, and would be placed in the chancel at the expense of Messrs. William, Samuel & George Coope. It, like the other furniture and appointments in the church, would be of Gothic design, and be made of English oak, unvarnished, and would be a great acquisition to the chancel. The whole of the plans met with the approval of the vestry, and were ultimately adopted.

## SCHOOL BUILDINGS.

**Edinburgh.**—During the last three years the School Board have built and opened the following schools:—North Merchiston, Warrender Park, Causewayside (additions to), and Stockbridge (gymnasium, also used as a class-room)—total accommodation 2,138, and the cost 21,704l. 8s. 4d. A new school is contemplated on the old infirmary grounds for 1,060 children. In connection with the High School, the Board have commenced the erection of a gymnasium and new lodge for the janitor. The designs for these additions are thoroughly in keeping with the rest of the existing buildings, and in preparing the designs the architect has taken care to preserve the amenity of the surroundings. The Board have also arranged to provide a swimming bath by utilising the present lodge of the janitor, which will be done at comparatively little cost. The estimates already accepted by the Board for these additions and alterations amount to 2,198l. 15s. 3d., and it is calculated that, after adding for fittings, painting, architect's commission, and extra work, &c., the total expense will be under 2,800l. The cost of providing fifteen new schools—being the total number completed at this date—has been 173,671l. 4s. 11d. Of that sum 38,664l. has gone for sites, and 135,007l. for the erection and furnishing of the buildings. The cost per scholar, exclusive of site, at eight square feet per scholar, has been 9l. 12s. 7½d.; or at ten and nine square feet, respectively in the juvenile and infant departments, the figures at which accommodation in the Board schools is calculated, 11l. 12s. 9½d. Adding the cost of the new writing class-room at the High School (1,735l.), the total money expended on buildings since the School Board came into existence has been 175,406l. 4s. 11d.

## ARCHÆOLOGY.

**Roman Sculpture in Lincoln.**—A sculptured stone has been recently discovered on the site of the new school of art. It consists of a block of coarse-grained local oolite, 3 feet 2 inches high, irregular in texture, and ill-adapted for fine work, although durable as a weather stone. It finishes with an abacus, 4 inches thick, of a Roman character, having a simple leaf enrichment cut upon the moulding. The sides are covered with flowers and foliage, boldly carved. The front angles are arris beaded, and the back levelled off to stand in front of a plain surface; it has not been built in a wall. The draped figure is in a very fair preservation, except the abacus, the face, and the cornucopia (which are mutilated); the feet, the right

hand and its emblem are destroyed; the nude portion of the right arm and the left hand are dilapidated and wasted by the action of the weather. The figure seems to have been youthful, judging from the remains of the right cheek and the ringlets that fell upon the shoulders. The terminal of the cornucopia and a portion of its upper end are intact: whatever was held in the right hand seems to continue behind the knee, and its stem appears between the feet. The attitude of the figure, seen from the full front, is graceful and dignified, the treatment of the girdle and costume so skilfully and truthfully arranged as to suggest a study from life. The delicacy of the workmanship, too, is remarkable considering the unsuitable nature of the material. In some respects this figure slightly resembles the caryatides from the front of the Pandrosion, of which the corner ones are a pair, the right knee of one and the left of the other being prominent, conveying an air of stability. The same effect is produced in the Lincoln example by gathering up a portion of the robe, thereby emphasising the contour of the limb; the tuck of the garment passes under and over the girdle, the remainder is undisturbed, and enwraps the figure's left side, leading to the inference that it stood at that corner of the erection. The sculpture shows a young female, bearing a cornucopia upon her left arm; this is symbolical of Ceres, and a representation of that goddess seems to be intended. The block was probably one of a pair or more of caryatides supporting a slab or other superstructure; the abacus is isolated, and did not intersect a similar moulding upon the abutting wall.

**Stratford-on-Avon.**—The Ancient House, date 1597, a building of great interest to all visitors to Shakespeare's town, has of late shown signs of decay, the beam carrying the upper floors having given way. The whole of the ground-floor front has been taken out, and a new front more in character with the old work has been put in, consisting of strong oak mullions and transoms filled in with lead work. The front removed was about 80 or 100 years old. Mr. T. W. F. Newton, of 7 Waterloo Street, Birmingham, was the architect.

## GENERAL.

**The Prince of Wales** has fixed the date of the Costume Ball of the Royal Institute of Painters in Water-Colours for Tuesday, May 19. His Royal Highness has signified his intention to be present, and will be accompanied by the Princess of Wales and Prince Edward.

**The "Ansidei Raphael"** has arrived in London from Blenheim, and will shortly be exhibited at the National Gallery.

**Messrs. Heywood Hardy and Charles Robertson** were elected Associates of the Royal Society of Water Colours on Monday last.

**Mr. F. Holl, R.A.**, has completed the portrait of the Bishop of Peterborough. It will be exhibited this year at the Royal Academy.

**Raphael's "Madonna di San Sisto,"** in the Dresden Gallery, has been subjected to a cleaning process, consisting in the complete removal of the old varnish and the substitution of new. There has not been interference with the original colours. Titian's *Tribute Penny* has been similarly restored; but an increased brightness of colour has been noticed in some spots, which may have been caused by a diminution of the quantity of varnish.

**The Exhibition** of the works of the late M. Bastien Lepage was opened in Paris on Monday.

**Mr. E. Burne-Jones** (who is a native of the town) was on Saturday elected president of the Royal Birmingham Society of Artists for this year. Sir F. Leighton, Mr. Millais, and Mr. Alma-Tadema were elected honorary members.

**The Halifax Art Society's Exhibition** has been closed. Although more visitors were admitted than in former years, only four pictures have been sold. One of the purchasers was a working-man.

**M. Heurtler**, a pupil of M. André, has obtained the Achille Leclère prize of 1,000 frs. at the Académie des Beaux-Arts, Paris, for an architectural design. The subject was "Un Château d'Eau." M. Marcel, who is also a pupil of M. André, has secured the Edmond Labarre prize.

**A Manuscript Book of Hours**, written in bold characters on 183 leaves of vellum, illuminated in gold and colours, with 35 elegantly-designed borders, composed of figures of birds, insects, flowers, &c., and 19 beautiful miniatures, the whole by a Flemish artist, octavo, was sold by auction in Edinburgh on Saturday for thirty guineas.

**The Annual Dinner** of the Artists' Benevolent Fund will be held on Wednesday, April 22, at the Freemasons' Tavern. Viscount Hardinge will preside.

**An Iron Church** is to be erected in Faversham at a cost of 700£. A site has been given by Earl Sondes.

**An Infirmary** is about to be erected at Crumpsall, Manchester, the estimated cost being 2,415£.

**Mr. Gladstone** has presented a bell, weighing 21 cwt., and framing for hanging to the church of St. Seiriol, Penmaen-mawr.

**Mr. D. C. Thomson**, the author of books on Thomas Bewick and H. K. Browne (Phiz), is a candidate for the directorship of the Edinburgh Museum of Science and Art.

**The Bradford Art for Schools Association** has started free drawing-classes for artisans, which are on two evenings in the week. Once a fortnight a concert is given.

**The Campbell Memorial**, in Stoke-on-Trent, is to be a statue in Minton Square, where one of Josiah Wedgwood has been erected.

**A Monograph** on the Temple of Solomon, by the Rev. Père Pailoux, a Jesuit, is about to be published by MM. Roger and Chernoviz, of Paris. It has taken several years to produce.

**A Pastoral Staff** is to be presented to Dr. Temple, by the clergy of the Deaneries of Moreton and Ipplepen, on his translation to the Bishopric of London.

**Mr. J. H. Morton**, of South Shields, has completed the plans of the new Higher Grade School at Jarrow Grange for 576 children, and they have been adopted by the School Board.

**Mr. J. Nodel**, of Manchester, has been successful in the competition for the Great Sankey Board School, Warrington. The other competitors were Messrs. Bleakley & Cubbon, Messrs. Willoughby & Frazer, Messrs. Pierpoint & Adams, and Mr. William Owen.

**Sir E. Beckett** laid the foundation-stone of the church of St. Mary, Doncaster, on the 12th inst. It is to be erected from his own designs. Messrs. Athrom Bros. and Gill are the contractors.

**Mr. John Clark**, of Paisley, has offered to subscribe 2,000£. towards the cost of deepening and improving the River Cart, provided thirty-eight gentlemen can be induced to subscribe a similar amount, so as to raise the 78,000£. which the proposed deepening and improving is estimated to cost.

**Mr. J. T. Brunner** has presented a building for a free library and museum to the town of Northwich.

**Messrs. Jones & Willis**, of Birmingham and London, have just completed, under the superintendence of the architects, the whole of the gasfittings for Holbeck Church, Leeds. The same firm also supplied the gasfittings and choir-standards for St. Anne in the Grove Church, Halifax.

**Mr. Notley** on Tuesday sold the freehold house, No. 159 Fenchurch Street, at the corner of Lime Street, containing a superficial area of 1,400 feet, for 16,700£., being equivalent to 12£. per foot.

**The Artists Corps** will muster opposite the Grosvenor Hotel, Victoria Station, at 8.30 A.M. on Good Friday, and entrain for Forest Row, under the command of Lieut.-Col. Edis. At Brighton the battalion will be quartered, as in former years, in the Corn Exchange. It is expected that the regiment will be nearly 500 strong on the occasion.

**Messrs. Brown and Albury**, of Reading, have dissolved partnership as architects and surveyors.

**The Bradford Town Council** have assigned a part of the Horton Park Cricket Ground as a site for the orphanage to which the late Mr. Joseph Nutter left a legacy of 10,000£., on condition that the site and building should be furnished by extraneous effort.

**The Black and White Exhibition in Paris** has attracted over 1,400 drawings from English, Russian, Belgian, Swedish, as well as French artists.

**The Duke of Devonshire** has had the walls of the north transept, the refectory, chancel, and sacristy of Furness Abbey supported and strengthened by means of strong stays and tie-rods. It was found that the vibration caused by the heavy mineral trains on the adjoining railway was likely to cause much damage to the ruins.

**The Foundation-stone** of the Municipal Buildings at Schaebeck, near Brussels, was laid on Sunday. MM. Snaps and Mège are the contractors, and M. van Ysendyk the architect. The building will cost 200,000 frs.

**The Duke of Hamilton** having offered 4,000£. for the erection of a church at Bo'ness, the Kirk Session have decided to make arrangements at once for the works.

**The Grand Hotel Ritschard** at Berne has been purchased by a company of French capitalists for 600,000 frs.

**The Boring for a Water Supply** of Bewdley is a failure. It was found that, after passing through the coal and iron stone, the water became worse. The alternative scheme of obtaining water from near the Severn is likely to be tried.

**Messrs. Davey, Paxman & Co.** are to supply the steam-power which will be required for the electric lighting of the Inventions Exhibition. In addition to the ten steam boilers and five powerful steam engines in use for the lighting of the Health Exhibition, eight large steel locomotive boilers will be added. It is computed that with the eighteen boilers 110,000 lbs. of water per hour can be made into steam of 100 lbs. pressure per square inch.

# The Architect.

## THE WEEK.

THE engineers of the Manchester Steam Users Association have introduced severe tests for boiler-plates. The pulling, or extension tests, are applied by means of a testing machine, and the strain is increased until the plate is torn asunder. Elongation, as well as the greatest tensile strain, is noted. The bending test is, if possible, more rigorous. Strips are taken of from 6 inches to 9 inches in length, and an inch in width. They are heated to a low cherry red, and then plunged in water of about 80 deg. Fahr. When cold the strips are bent double, the rule being that every one must hinge on a curve, having a radius of not more than one and a half times the thickness of a strip, and it is expected that the bending will be accomplished without any sign of failure being visible. It has been found that steel boiler-plates as now made are, as a rule, much more ductile than iron plates. Strips cut from iron boilers have, on being tested, in some cases behaved most unsatisfactorily. They fractured on bending at the slightest departure from the straight line, and, on being pulled asunder, broke short off without any elongation, showing that they were of a very brittle character, and unfit for use in a boiler. Short brittle plates are apt to give rise to dangerous cracks, which lurk at the rivet holes and lie concealed under the overlap, till in course of time a rip suddenly occurs and gives rise to an explosion. If all boiler-plates were tested on a similar principle, it is considered that many explosions would be prevented.

A STATEMENT has been prepared by the Dean of ELY showing the expenditure on the restoration of his cathedral. Up to 1870 the outlay was about 70,000*l.*, on works directed by Sir GILBERT SCOTT. In the ten years ending 1884 the sum of 4,621*l.* has been expended on the completion of the dome and lantern, which were restored as a memorial of Dean PEACOCK. Several other sums, amounting to over 2,400*l.*, have been paid for repairs of roof, painting, paving, &c. In addition, works have been carried out in the deanery canon's residences, and the schools and Hereward Hall has been erected. The abstract of accounts is by itself evidence that the members of the Chapter of Ely are not indifferent to the buildings which have been entrusted to their care.

THE Cathedral Commissioners suggest that in the diocese of Manchester it would be well to give power to a Board (subject to the sanction of the Bishop and the Ecclesiastical Commissioners) to encourage and assist in the erection of parsonage houses. The money is proposed to be raised on the security of the tithe-rent charge belonging to the Dean and Chapter, and a sum not exceeding one-half of the estimated cost is to be advanced. Both principal and interest are to be repaid by annual instalments in the course of forty years.

It is the general fate of projects for buildings of a public kind to have opponents as well as advocates, and the contest between them sometimes presents strange scenes before a victory is secured for one side or a compromise is arranged. In Dumfries at the present time a contest of the kind is going on, but it has assumed a Homeric character, for the combatants expect that Heaven itself will join one of the parties. The members of the George Street Free Church propose to erect a hall for meetings immediately, and eventually a church. A part of the site of an old prison has been bought. It is the wish of one party in the congregation to proceed with both buildings simultaneously, and, if economy is considered, that would be the better plan. But others are frightened with the boldness of the undertaking, and they desire to rest and be thankful in the existing building. As both parties are resolute, it was resolved to have a prayer contest. It was conducted in the following way:—"Four office-bearers were called upon to pray, two selected from the 'building' section, and two from the opposition,

a member of each party being called upon in turn. The proceedings thus partook somewhat of the character of the ancient 'jousts,' in which single combatants were pitted against each other. Opinions as to the success of the champions seemed to vary with the sympathies of the congregation; but it was felt that the equality of the forces was disturbed when the minister, who is a keen sympathiser with the 'forward' party, took the last word. The proceedings are to be repeated next Sunday, and it is understood that a meeting of the congregation will then be held to deliver, or to hear, the divine judgment." It is not for us to pass an opinion on the faith that is shown in the contest, but it is plain that the combatants had not exhausted human means. Is there no architect in the case whose opinion can be taken as trustworthy?

THE studio of M. DETAILLE contains a collection of blocks in the form of heads of soldiers, on which helmets and other head-coverings, belonging to the French army, are placed. The artist has also a valuable collection of uniforms. M. DETAILLE has, with them and other data, completed a series of water-colour drawings, which show the uniforms of the French army since the First Revolution in 1789. They have been reproduced and will form a delightful work, for, as every one is aware, M. DETAILLE is the first among living painters of military scenes. It is strange that a corresponding work has not been attempted in England, unless on a scale that is almost trivial.

A DECISION which has been given this week in the Glasgow Sheriff Court suggests a difficulty which appears to arise more often since the passing of the Employers' Liability Act. If an accident should arise to a man employed by a sub-contractor, is the general contractor or another sub-contractor, as the case may be, to be made responsible? The workmen answer in the affirmative, for the simple reason that they prefer to have the privilege of suing wherever there is a better chance of obtaining compensation. But the judges are, as a rule, not disposed to take that view. In the Glasgow case a man was employed by a firm who were engaged in laying concrete in a new building, and he was injured through the carelessness of a man belonging to the contractor for plumbing and gas-fitting. He brought an action against the contractor and failed. According to the Sheriff's note, his lordship is of opinion that in cases where the execution of a work had been given to several contractors, it would be unfair if a workman in the employment of one contractor had recourse against another contractor for injuries caused by the fault of the latter's servants. The principle applied to such cases was that where a workman became one of many working in a common organisation towards a common end, he accepted all risks naturally incident thereto, and could not enforce liability for injury except against the person who caused it.

THE voting for the jury in the section of painting for this year's Salon shows that the ten most popular painters in France are the following:—MM. BONNAT, J. LEFEBVRE, J. PAUL LAURENS, HARPIGNIES, T. ROBERT-FLEURY, BOUGUEREAU, HENNER, HUMBERT, FRANÇAIS, and CABANEL.

It is proposed to restore the Cathedral of Berne, and many designs and models have been prepared for the purpose, which are to be seen in the local Fine Arts Museum. People who know the history of the building have, however, misgivings about the success of the work. According to tradition, the unfinished condition of the cathedral was not caused by want of funds, but by unsafe foundations. The architect, it is said, carried on his work until he saw signs of settlements, and then he wisely desisted. If a tower and flèche are added, there will be much additional weight thrown on the walls, which are now no more than safe. The building is interesting, and contains excellent sculpture. Naturally the townsfolk wish to see it perfect, but they are likely in consequence to undervalue the risks attending additions. If the work is to be done, it would be well to have independent opinion upon the strength of the masonry.

## PHœNICIAN ART.\*

THE Phœnicians appear to have held a place in the ancient world that was analogous to our own in modern times. They were a great trading race, and whenever it was found to be more profitable they were ready to produce goods of an artistic class instead of importing them. When commerce becomes a factor it is always difficult to analyse. Designs are sent from London to Japan to be carried out, and cottons are woven in Lancashire which are printed in India. If any of those examples of Western and Eastern co-operation should survive, it will be impossible to apportion the respective merits of the men who produced them. Thus it was in Phœnicia. The merchants were a sort of organising power; results were the chief consideration, and wherever able artists were found they were turned to account. Who can tell how often the ideas were derived from the brown traders, and whether the Greek craftsman simply worked according to order?

It is not surprising that so little is known about the people. They seem to have looked at life from a merchant's stool, and to have judged of things according to their money value. We can imagine them asking, What was the use of keeping beautiful works when it was so easy to put them in a boat and send them westwards, where a high price could be obtained for them? and wondering why so much should be expended in Egypt on temples and pyramids, things which count for so little in the science of exchange. The typical nineteenth-century man of science, according to WORDSWORTH, would not mind botanising on his mother's grave, but Phœnician irreverence was of a lower kind, for the grave was likely to be rifled if it contained any trinkets which might be bartered. The king himself, the mighty ASHMENASAR, could not expect to moulder in peace. His sarcophagus was discovered in 1855, and inscribed on it was an appeal for forbearance that is more pathetic than the one which is seen on the player's monument in Stratford-on-Avon. It was to this effect:—"I myself ordain that the nobles and people shall not open this place of rest, nor seek for treasures in it, nor carry away my tomb, nor otherwise disturb me. Whoever shall do so, may they find no rest nor burial." A few words like these are a revelation, and throw more light on the character of a people than could be derived from a big book. It is plain from them that in Phœnicia everything, including what should be sacred, was supposed to be subservient to gain, and as the foreign markets were, the most profitable, little would be retained that was of value. It is, therefore, vain to expect much from explorations in the country, or to judge of the art of the people from the remains which may be found in Phœnicia.

For many a year the Phœnicians have afforded a safe subject for speculation, and from SANCHUNIATHO to Sir WILLIAM BETHAM it has been utilised without becoming exhausted. History did not pay in old days, and when a scribe was found in any town of Phœnicia the last thing he would be set to work at was the compilation of records. Modern research has not yet been able to pierce the darkness which surrounds the people, and after all his study M. RENAN can only suggest that they were akin to the Hebrews. When they were most powerful the Jews did not attempt to subjugate the Phœnicians; it was with difficulty they were restrained from borrowing gods and rites from their neighbours, and every one knows that when the great temple was to be constructed, the architect as well as the workmen were brought from Tyre. "If you refuse to admit that the Phœnicians were of the same blood as the Jews," M. RENAN asks, "how do you account for their speaking and writing, not one of the idioms which we encounter at their best in Africa, but a language that differs little from pure Hebrew?"

In the "History of Art in Phœnicia," which is the latest part of the Universal History of Art on which MM. PERROT and CHIPIEZ are employed, the discoveries are put in the first place, and the speculations which are inevitable with such a subject do not assume undue importance. After describing the country and the people, the religion of

the Phœnicians is considered. It was not apparently of an exalted kind, and contrasted strangely with what was found in Judea or in Greece. The idols in the Louvre are hideous, and were fit accompaniments of a belief in the utility of human sacrifices. But the explanation is to be found in the character of the people:—

They were, in fact, merchants and sailors. There was no room in their lives either for literary or philosophic culture, or for those æsthetic pleasures which soften the heart and elevate the mind. Torn on the one hand by their sensual desires and on the other by greed of gain, hardened by conflict with the sea and softened by the pleasures that awaited them ashore, the Phœnicians swung from one extreme to another. When their ventures were turning out badly, when their fleets were threatened by storms or their armies pressed by the enemy, they turned in despair to their gods; and made those impious vows which they carried out only too well. A people of traders and harsh to their own debtors, they believed their gods to be as exacting and pitiless as themselves; hence the terrors which led them to sacrifice so many young and innocent lives.

With those notions respecting gods the Phœnicians were not likely to set much value on beautiful temples; and, moreover, there was a liking for monolithic buildings and grottoes, which would make architecture almost an impossibility. The stone along the shore of the Mediterranean was rather friable, and the builders tried to compensate for the defect by using stones of enormous size. The magnitude was heightened by rustication. In Phœnicia brick was apparently never employed, although brick structures are found in Cyprus and other settlements belonging to the people.

Columns were not much valued, and were rarely employed even as accessories. A Phœnician base has not yet been discovered, and it is assumed that "the column was, as a rule, a monolith; and on those few occasions when it was made up of several pieces, as in some of the Cyprian remains in the Louvre, the sections occurred at random, being governed only by the shape and size of the stones, and not by the natural articulation of the support as a whole." The shafts are generally without fluting. In the capitals there is variety. One from Golgos has a rude Doric character, and there is an indication of the Ionic in the Cypriot pilaster caps which are in the Louvre. But apparently something symbolic is suggested by the mixture of triangles, crescents, and concave curves which cover the face, and recall work in the precious metals. We have also a capital that can be called Corinthian, although the calathos is merely ornamented with a few rows of branches, and it suggests to M. CHIPIEZ the employment of metal sheathing:—

It must have been in capitals of this latter form that metal supports, or wooden columns overlaid with metal, terminated. In Phœnicia, as in Egypt and Chaldea, these slender shafts must sometimes have been used, as, for instance, in the support of the salient parts of a building or of porticoes. The penthouse of the Amrit tabernacle seems to have been thus upheld by bronze columns, of which traces have been found on the entablature. Not that the latter requires any supports; but the probability of their having nevertheless existed is rendered very strong by the arrangements of the hypogeum near Cagliari, known as the Serpent Grotto. This monument seems to date from the Roman decadence, but there are peculiarities about it which deserve attention. To the under surface of the architrave the remains of one or two capitals still cling, which, by their size, must have belonged to very slender shafts indeed—so slender that it is in the last degree unlikely that their material was stone. Phœnician was still spoken and written in Sardinia after the Roman conquest, and there is nothing surprising in the fact that architects and ornamentists should also have preserved their taste for arrangements with which they had become familiar during the long Phœnician supremacy.

The influence of Egypt is plainly marked in some of the details, as in a cornice shown by M. RENAN, in which the asp is the *motif*, and an effective one. The winged globe and other symbols are also found; but in the execution there is a combination of Assyrian boldness with the Egyptian ideas. If expensive metals were occasionally used, it is easy to understand the admiration expressed by HERODOTUS on seeing the Tyrian temple.

From the Greek historian's description it is impossible to form a notion of what the Tyrian temple was like. He says simply that it was enriched with magnificent gifts among them being a pillar of gold, and one of a materia

\* *History of Art in Phœnicia and its Dependencies.* From the French of Georges Perrot and Charles Chipiez. Translated and edited by Walter Armstrong, B.A. Chapman & Hall, Limited.

which was resplendent by night. But as with one exception there was apparently nothing in the Phœnician ritual for which the Temple of Immensity might not serve as well as the Parthenon itself, there was little use in a building unless to serve as a storehouse for donations. Yet, from the remains which exist, it is plain that the temples were very remarkable in plan if not in elevation. It is, however, impossible in a newspaper to enter into the exceptional purposes for which the temples were employed. M. CHIEPZ has a hope that if the exploration of Cyprus were conducted exhaustively, much more information would be derived from that island, which was one of the most renowned settlements. The Phœnician type of temple is not, however, without a sort of representative, and a notion of it may be derived from some of the old Cairene mosques, and especially from the great court at Mecca. On this subject the authors write as follows:—

In spite of the scantiness of the data, the individuality of the Phœnician, or rather of the Semitic, temple stands out with sufficient distinctness to allow the historian to grasp its salient features. It is distinguished from the most familiar of our types, that of Greece and Rome, by one capital difference: it attaches much less importance to the *cella*, the chamber in which the image or symbol of the god is placed. It consists of a great court or open-air hall, in the centre of which, at one extremity, rises a tabernacle or pavilion, with the emblem of divine power beneath its shelter. In Greece the attention of the architect was concentrated on the *cella*, the home of the god, the dwelling-place of his often colossal statue. In Phœnicia the symbol was, as a rule, of no great size. The grandiose feature of the Semitic temple was the peribole, the courtyard with its continuous portico, which in some cases included a fine order and a rich scheme of decoration. Even now the Semitic race is not without places of worship in which the general arrangement is much the same as this. In the first place, there are old mosques at Cairo, those of Amron and Tonloun, for instance, where great quadrangles are surrounded by single or double-aisled colonnades, and nothing is wanting but the idol. But if we go to Mecca we shall find the type in all its completeness in the mosque of the Caaba. Even the triumph of the Koran has not abolished the betye, and there, standing in the centre of the wide enclosure, the mystic stone has received for centuries the homage of the Arab tribes.

The masonry has been so worn by time it is difficult to conclude to what extent it was originally dressed. A relic of the early tabernacles, which were cut into the solid rock or wrought from a monolith, is to be seen in the use of colossal stones in their buildings. Many of them seem to have been set up as they left the quarry. There is one example—and only one, we believe—the remains of the Hagiar-kim temple at Malta, where the stones are sparrow-pecked all over, and the work has been interpreted as an imitation of the star-strewn sky. But M. CHIEPZ believes it was “a decoration suggested by the same ideas, and carried out on the same principle, as the carefully-chiselled joints of which other workmen of the same race were so fond.”

In secular works there was a nearer approach to architecture than in the temples. The fortifications were massive examples of construction, the hydraulic works might be compared with those of the Romans, and the harbours were surprisingly well arranged. There are a few fragments of masonry belonging to dwelling-houses, and it is supposed that the villas at least of the Phœnicians showed signs of taste as well as of luxury. The prophet, in addressing Tyre, suggests that the merchants were surrounded with precious things—“Thy builders have perfected thy beauty; the company of the Ashurites have made thy benches of ivory, brought out of the isles of Chittim”; and, from what we know of the people, it is not unlikely that their dwellings were the best examples of Phœnician building.

Works of sculpture, painting, pottery, metallurgy, textiles, which are ascribed to the Phœnicians, still survive. The examples which were found in Cyprus by CESNOLA, and are now in New York, are by themselves almost sufficient to suggest how much art work was produced in Sidon. But it would be difficult to define the characteristics by which the work is recognisable. There are over six hundred illustrations in the volumes of MM. PERROT and CHIEPZ, but from the variety that is among them they could be divided into groups as representing the work of other races. Some things are markedly Assyrian, others are as distinctly Egyptian: we see even signs of the Greeks. A coin of Carthage is late Greek. The objects found by Dr.

SCHLIEMANN, which are supposed to be prehistoric, have corresponding types in Phœnicia. The traders travelled so far and mixed with so many races as to become cosmopolitan, and slaves from all lands then known may have worked in their factories. The native style of Phœnicia, if there was one, was not fostered, or it was lost in the eclecticism which was a consequence of extensive commerce.

The remarkable variety imparts interest to Phœnician work. In studying the examples we seem as if we were reading a volume which is mainly made up of quotations from unknown authors. There are figures which appear to be bad copies of something better, while others look as if they had been produced to suit particular markets. Indeed we can say that no art is so widely related as the Phœnician. The old race of writers paid little attention to figures in stone and terra-cotta, and to them Phœnicia was a mysterious land, which had given rise to a vast number of fabulous stories. MM. PERROT and CHIEPZ, on the other hand, endeavour to base their conclusions on things which have been discovered; they are wedded to no pet theory, and consequently there is no straining after conclusions in their book. In their pages we can see what modern research has done towards dispelling the gloom which has fallen on the life of one of the greatest peoples of antiquity.

### VICTOR HUGO ON EUGÈNE DELACROIX.

THE exhibition of the works of Delacroix in Paris has recalled many references to the painter which are found in the books of modern writers. Among others is a record of a conversation between Victor Hugo and Arthur Stevens, the painter, who was an enthusiastic admirer of the great artist. The subject of the after-dinner talk on the occasion was painting, and when Delacroix' name arose M. Stevens expatiated on the qualities of his works.

Delacroix has every quality save one, said Victor Hugo, but it is one that is most essential, and is always to be found in the works of supreme artists, whether painters or poets—it is beauty. With the exception of those in the *Apparition of the Angels*, in the church of St. Paul in Paris, and a figure in the *Massacre of Scio*, in the Luxembourg, there is not one beautiful woman in all his pictures. There is expression, but it is not the ideal. The *Algerian Women*, which sparkles with light and colour, presents the exquisite ugliness that is to be found in his works.

But, said M. Stevens, is not expression by itself beauty? Have we not there a type of beauty that is definite and apparent? We can see the constituents of ideal beauty—large eyes, a straight nose, a small mouth, a round chin, a high forehead, an oval visage—in the blocks in a hairdresser's window, and the result is a monster. Out of a low forehead, a large mouth, a short nose, and small eyes, Delacroix is able to create beauty that fascinates.

It is brilliancy, said Victor Hugo, but not beauty. In speaking to Madame Dorval I once ventured to tell her that she was not pretty, but worse. We might apply the same phrase to all the women of Delacroix, and addressing his Odalesques, his Ophelia, his Marguerite, his Medea, his Magdalen, say to them, “You are not beautiful, but dangerous. The line of beauty in your faces, if luminous, is broken; but you dazzle and overcome like a flash of lightning. You are irresistible as Fate, and those who admire you do so in spite of you and of themselves. You may well be proud, for you are irresistible. The *Night* of Michael Angelo, the prodigious seraphim in *The Last Judgment*, the superb angel in the *Tobias* of Rembrandt, and the exquisite little girl in his *Night Watch*; then below those two inapproachable masters, the *Jocunde* of Leonardo da Vinci, the *Antiope* of Correggio, Titian's *Mistress*, the *Virgins* of Murillo; then, lower still, the *Magdalen* in Rubens' *Descent from the Cross*, the splendid nudités in the *Fécondité* of Jordaens, the *Exterminating Angels* of Frank Floris, the *Herodiade* of Quintin Matsys, the *Virgins* of Van-dyke; then, in another sphere of art, the women of Watteau and the patrician dames of Paul Veronese, all realise the eternal type of beauty, and by the unanimous consent of all eyes are tranquilly sublime. But you, creations of some unknown sorcery of art, bewitch us into admiration.”

Surely, said Stevens, that is enough for a painter.

Granted, replied Victor Hugo, but we must then take another point of view. The question we are dealing with is beauty that is eternal, however much it may be multiplied and varied, and is always recognisable by the only definite judge of art, the public. Observe, I have not mentioned Raphael in my list. Raphael's beauty is cold. He was deficient in expression, as we may judge from the monotony of the faces of his Virgins. I don't care for beauty without expression, or expression without beauty. Now we can say of the women painted by Delacroix that they have expression—but are without beauty. They are all, probably, in accordance with the ideal of Eugène Delacroix; but it is not the ideal of the human mind. Passion is there, but where is the face? Would the look be less intense if the eyes were beautiful? would the cry be unheard if the mouth were fine? would there be less thought with a high forehead? The painter, even more than the poet, is bound to render above all things the material form. We writers can, if we think it better, paint the gesture rather than the arm, the looks rather than the eyes, the attitude rather than the body, and life and passion rather than the form. We give expression in the first place, then we draw, and we may not even draw what is expressed. But what is the writer's privilege is far from being the painter's also. I defy any painter to express as we can a blow of a fist that has not five fingers; a look of love without the aid of an eyeball; a reverie without a forehead; or to suggest a great heart unless there is a breast-bone.

One day Eugène Delacroix made me look at one of his finest pictures—*The Assassination of the Bishop of Liège*. Of course I admired it, but I put a question to him. Pointing to a figure, I asked what the man held in his hand. Delacroix, in reply, told me that he wished to paint the flash of a sword blade! Now to paint the flash of a sword without the sword itself is not a possibility with the painter's art, but with ours. There is in one of the Paris churches—I think it is St. Etienne-du-Mont—a picture, by Albert Dürer, which represents the beheading of St. John the Baptist. It shows the very thing that was sought by Delacroix. You get an impression of a stroke that flames as it falls, of a thunderbolt that nothing can resist, much less a head. The effect is formidable. But when we examine the picture we find that the sword is represented in the most painstaking way. It is a large and strong blade, square at the end, with a sixteenth-century hilt, which is as finely wrought as it is adapted to the hand. The flash satisfies a poet, and the sword would please an armourer. The picture is complete. Colour and drawing, spirit and form, life and style, expression and beauty, are so well combined that they cannot be separated. The painter's aim has been attained. If to the perfection of expression and of beauty in his work the painter, sculptor, or writer will add an idea of progress, if the *chef-d'œuvre* be also useful, if it be intended to enlighten rather than to dazzle, if it be not only the beautiful but the true which is sought after, then we have the ideal of art. I have said all this before in a book entitled "William Shakespeare." There also will be found this expression, "It is not against the lions that the prophet roars, it is against the tyrants."

## WESTMINSTER HALL AND ITS ADJUNCTS.

[BY A CORRESPONDENT.]

AS Mr. Shaw-Lefevre informed the Select Committee that "it might be understood that the idea of completing Sir Charles Barry's scheme had been given up," some more modest plan will, I presume, have to be adopted. The present manifestly incomplete arrangements are an eyesore, and it is not quite to our credit that they should have been suffered to exist so long. Let us hope that Lord Rosebery will be not less vigorous at the Office of Works than the late First Commissioner, and that in architectural matters he may be even more successful.

I have been considering this question as a whole, the only method, I think, of arriving at a satisfactory result. At all events, if any one will consider my idea it may aid in the determination of three questions, more or less intimately connected—viz., the treatment of the Hall, the providing of a moderate addition to parliamentary accommodation, thought by

some members of Parliament to be urgently required, and, the Abbey being full, the erection of a monumental chapel for future memorials.

Considering that the present open character of the neighbourhood is very agreeable, and that lofty and continuous buildings would both swamp the Hall and shut out from view the present beautiful *ensemble* of Sir Charles's towers and spires—which time has almost sanctified—I would suggest that any future buildings should be not more than two storeys above ground—one tower, perhaps, being sufficient to maintain architectural character and harmony with the existing structure—and that they should be disconnected except on the ground-floor. The great gateway should be the noblest Gothic gateway ever built, having numerous arches surmounted by the beautiful fan groining characteristic of the style. As the west face of the Hall originally formed part of an internal court of poor architectural detail, but is now destined to fulfil a more important external office, common sense seems to demand that it should be liberally restored with at least a new battlemented parapet. For my own part, I agree with Mr. Seddon that stone dormers similar to, but plainer than those of the Hall at Rouen, would be the best means of getting rid of the unfortunate lowness of proportion.

By diverting St. Margaret Street, which could be easily done, a site for a campo-santo, or monumental chapel, might be secured at the cost only of the diversion. No purchase-money would be required. The cost of the land alone for the proposals to the south of the Abbey—of Dean Stanley and Sir Gilbert Scott, Mr. Shaw-Lefevre and Mr. James Fergusson—varied from 200,000*l.* to 80,000*l.* Nearly the whole of this would, therefore, be saved. Now, if the continuity in the unrivalled series of our national memorials is not to be broken, this is a most urgent question. The diversion of the street would provide an admirable site. The building could be connected with the Abbey by a crypt which, as connected with the commemoration of the dead, would be of appropriate character. Crypts are important features in Continental churches. In some cases they are more beautiful than the churches above them. A few steps in the Abbey would lead to the one now proposed, which might be arcaded to receive future monuments, and be lighted by a lantern, forming an ornamental feature above ground. Doubtless, the Dean and Chapter of Westminster, as patrons, would not very seriously object to a new east end—for such it would appear to be—being added, without cost to themselves, to St. Margaret's Church. The monumental chapel, as a national work, would properly be paid for out of national funds, and, like the present restoration of the Abbey, would be undertaken by the Government and the Ecclesiastical Commissioners. The proposed diversion of St. Margaret Street would also secure a direct approach to the Queen's entrance to the House of Lords under the Victoria Tower, as well as to the Lords' entrance at St. Stephen's Porch, instead of the present tortuous and contracted road, while the Abbey, the Monumental Chapel, the Hall, and the proposed new buildings might be kept as separate as possible. There would result a very striking, if not unequalled, architectural *coup d'œil*.

## DESIGNS FOR CAST-IRON WORK.\*

SO many disturbing elements intervene between the conception of a design in cast-iron, and the completion of the work in the building, that we all have to allow what we call a factor of safety (aptly characterised by the late Alexander L. Holly, C.E., as a factor of ignorance) to cover these contingencies, varying from three, or one-third the breaking strain in very simple cases, where the quality of the castings can be depended upon, to five or even ten where the design is more intricate, or the liability to shrinkage strains, hidden defects in the castings, rough bearing surfaces, or uncertain variations of the load are possible. Much can be done by designers of cast-iron work to reduce this factor of safety, and consequently the weight and cost of castings, by giving serious consideration to the many processes and changes of condition through which their designs pass on the road to the building. Foundrymen exercise great ingenuity in producing any design in iron that

\* From instructions by Mr. C. W. Trowbridge in the Hand-book of the Union Foundry and Pullman Car Works of Chicago.

may be presented to them; still it is possible to design things that are totally impracticable in cast-iron, in which case the designer would probably be asked to modify his drawing, but when it is possible to carry out a design without change it is the almost universal practice to do so without comment and without recollection of the fact that the resulting castings may have very serious shrinkage strains or other defects, which would reduce the strength far below what the designer expected.

For instance, a column, say 16 feet long, 8 inches in diameter,  $\frac{3}{4}$ -inch metal, is sometimes designed with a heavy projecting base moulding near the bottom, say 12 or 14 inches in diameter, giving 3 inches or more thickness to the metal at that point, also having an extension of the shaft to pass down through a shell plinth or pedestal, while at the top there is a shell cap and then a shelf, say 12 by 24 inches for girders, made, possibly,  $2\frac{1}{2}$  or 3 inches thick, to insure strength without the use of brackets or ribs. This, like all other architectural work, will be moulded in "green sand," which is moulding sand slightly dampened with water, and rammed solidly around the wood pattern, forming a mould strong enough to withstand the wash and pressure of molten iron running into the mould. When we consider that iron weighs four hundred and fifty pounds per cubic foot, while water only weighs sixty-two and one-half, an idea may be formed of the strength of mould necessary to stand the wash and pressure, which, in a mould 3 feet high from the bottom of the casting to the top of the gate, where the iron is poured in, is fourteen hundred and forty pounds per square foot, nearly three-quarters of a ton on each square foot of surface: consequently the sand must be firm.

Now, realise that the pattern for this 16-foot column is made 16 feet 2 inches long, to allow for shrinkage; also remember that when this shrinkage occurs something has got to give. The shaft of your column being only  $\frac{3}{4}$  of an inch thick, will solidify and commence to shrink, while the metal in your heavy base moulding and the shelf at the top is still fluid, and a little metal will run out into the body of the column as it draws away in cooling, leaving a little vacancy or depression in the upper part of the shelf or base. Presently these heavy parts will become about the consistency of cheese, but the shaft of the column keeps on cooling and getting shorter. Now the situation becomes serious. The soft metal in the base and shaft is not solid enough to allow the column to draw them bodily through the sand mould, so they stay where they are and the column shrinks away, stretching out more of the soft metal after it, making a weak place or leaving a nice little crack to be filled up with putty before the column is painted, and in an extreme case pulling away so much that the head will drop off when the column is hoisted out of the mould. Then the foundryman looks wisely at the column and says, "Now I will fix you," and puts a fillet around below the shelf, or a bracket, which will cool quickly and help pull, chipping out the bracket when the column is cold. In case all these fail, he just lays in some cold pieces of pig-iron before closing the mould, and they cool the heavy places off rapidly and everything is lovely. This last makes the soundest job in the lot, as they all melt down together; still there is liable to be dirt on the surface, and shrinkage strains that would not be there if the designer had made his metal in the shelf only one and one-quarter or one and one-half times as thick as the shaft, put in some strengthening ribs or brackets, and had also made his whole base shell, except a small bead or fillet, thereby justifying a smaller factor of safety, and allowing all parts to cool at the same time. Mullion columns are often designed with a heavy square face cored out, which stands in front of the wood frames, while a thin web runs back between the sash-weight boxes. This is an exceedingly hard shape to cast without shrinkage strains. The cored part in front only radiates heat from one side (the core being quickly heated through), while the webbed back runs away off towards the remote parts of the mould, giving off heat on both sides, and the extreme back edge radiates in all directions but one, thereby cooling much faster than the front part, so that when the back has attained its length for normal temperature the front is still red-hot, and much longer. When the front cools there results a strain, which gives this column all it can do to hang together until it gets into the building, without doing its full share of work after getting there. Moral: A good, liberal factor of safety, or a nice large rib of metal, round or square, on the back of the web to keep it from cooling too fast.

The privilege of modifying the thickness of parts of castings to avoid shrinkage strains is one that a designer can safely give a foundryman, for it is always cheaper to make castings right than wrong, to commence with. Still, any foundryman can call to mind numerous instances in which he has received serious rebuffs when he has volunteered advice which he considered good to designers who did not care to hear it, consequently they are often backward about volunteering their opinions. Unequal cooling and consequent crookedness of shell pilaster faces, frieze plates, and light ornamental work is usually corrected by the foundryman without asking the designer's permission, as it is utterly impossible to get light work straight

without providing for equal and uniform cooling. But in the manufacture of thicker pieces and parts intended to sustain loads of any kind, the foundryman never makes changes or asks permission to change, if he can possibly execute the work as per drawings received. Generally speaking, a more intimate association between designers and executors of cast iron would result in a great saving of metal and a reproduction of the factors of safety. Imperfect and unsound castings, owing to carelessness in the manufacturing, are much more rare than is generally supposed. Cold shuts from pouring the metal too cold, honeycombs, dirt, and scabs from soft or unclean moulds are quite rare, and never dangerous in the work of reputable foundries. Many more bad castings are made through an honest endeavour to carry out a design which is not positively the best thing possible for the place, than from carelessness in the execution of the work.

Among the most noticeable indications of shrinkage strains in finished castings is crookedness. One side will be shorter, thereby giving the whole piece a crook, or in the case of wide plates they sometimes appear with the centre perfectly straight and both edges "loose," or apparently too long for the centre. The same may be said of the thin back ribs sometimes put on mullion columns. This comes from the apparently long parts cooling first, so that when the heavier parts cool afterwards the light parts are left too long for their places, while the loss of strength incident to these causes is usually provided for by the enormous factors of safety used. Still, if designers would examine their castings carefully they would soon be able to design forms not liable to these defects, and reduce their factors of safety accordingly.

### MR. P. MORRIS, A.R.A., ON ART STUDY.

THE prizes in the St. Martin's School of Art were distributed last week by Mr. Phil. Morris, A.R.A. He said he had yielded to the flattering solicitation of his friend, Mr. John Parker, the master of the school, which has turned out so many competent, and not a few famous, painters.

In studying art it was indispensable that the student should begin at the foot of the ladder—with drawing in outline. At first sight it might not appear an inviting task to have to copy apparently tedious outlines, suggestive of so many worms trying to wriggle themselves straight. But those well-known curves, which were really the outcome of the great knowledge of Mr. Dyce, contained every beautiful outline, and if the student would only work at them and take heart, he would find that they would powerfully contribute to the development of his powers of perception. The tradition of the "O" of Giotto was perhaps no mere fable, but the faculty attributed to that artist was possessed by few. Daniel Maclise had it, and it was said that he could trace a circle so perfect that compasses were necessary to prove its inaccuracy. How many men had started on a wrong road, and with pain and difficulty had had to retrace their steps before they found the right road. It was in schools such as the St. Martin's that they were educated in the first principles of real art. Looking around at the works exhibited in a room above them, he had been very much struck with the ability with which the students had grasped the most difficult branch of all, and that was, painting from the life. While they were drawing from copies they were only in the preface, but as soon as they drew from life they opened the first page of the book which it would take them their whole lifetime to read. He remarked that they had some faculty of sketching, but none of imagination. It was a very good thing to exploit the faculty of throwing off from the mind designs in light and shade, in outline or colour, but the great glory of art was the imaginative faculty, and this was the last faculty developed in humanity. At the present time realistic painting was dominant, and certainly that should be so, for it was upon this that all imaginative painting was built. But he maintained that this was only the bricks and mortar of the edifice; the imaginative faculty took the place of the architect, who gave the beauty of design to a building. Never let them therefore for a moment begin to sketch before they had well conceived their subject. If they had only to depict a couple of horses, or even a couple of tubs, it was possible to give an air of style to them, although the sketch might be a comic one, for there was such a thing as style even in comic art. The study of art was still behindhand in this country, and the only hope for it was in such schools as the St. Martin's, where there were earnest students who formed each of them a centre from which they disseminated well-digested principles of art. It might be hoped, therefore, that in the future generations this country might be a centre of art in Europe, for he was quite certain that in no country had the subject of art been ever taken up more earnestly than in this country at the present time. The beauty of the painter's art was the delight which it gave to the possessor in the opening of the book of nature. The charm of colour in common objects which before had

never been observed, the exquisite grace of curves of line, the form of face, everything in nature had power to speak to the artist. It was like an added sense, and he regretted that those gentlemen who rode behind the art coach, the writers upon art, had not sufficiently shown the beauty of this development, and urged people to see nature as it could only be seen by an artist. To the ordinary man a fine day was merely a fine day; but to the artist the beautiful analogies, the harmonies in sky, distance, and foreground, the effect upon faces and figure, the light and shade, all of which it presented, were a marvellous source of delight, and it was the artist alone who could see and appreciate them. He rejoiced, therefore, to consider the progress which had been made in recent times in the study of art in this country. To be able to sketch is no longer in the professions, and especially in the army, so great a distinction as formerly, owing to the spread of knowledge. In fact, it could no longer be said, as was once said with some truth by Mr. Ruskin, that no one looked at art, no one cared for nature, except when the sun looked like a frying-pan or the moon like a fool.

## YORK ARCHITECTURAL ASSOCIATION.

A LECTURE on "Building Construction" was delivered by Mr. R. A. Parkin, architect, at the last meeting of the Association. In commencing, it was regretted that there was at present no systematic training for architecture. If a youth entered an office he proceeded upon no fixed plan to learn his business, and it would be a great advantage if there could be schools established to teach youths the rudimentary principles of the profession they were about to adopt. Another thing which prevented many from following the constructional part of the profession was the fact that architects who desired to become architectural artists were afraid of becoming utilitarians. An architect to be perfect in his profession should be an universal genius; and surmount any difficulty in construction; and more than that, he should have a knowledge of science, so as to enable him to perform his work in a true manner—true in an artistic sense. Mr. Parkin referred to the varying solidity of the earth which formed the foundation for the building. Uniform resistance should be carried out, and they should avoid underpinning wherever possible. Referring to the construction of walls, he remarked that brickwork could never be crushed by fair means. If the foundation was good, it was almost impossible to build a building high enough to crush brickwork. The scientific construction of the walls was never considered at all by some people building them; they generally built them thick enough to stand, and of course the builder had to pay the cost. He spoke of the formation of arches and the pressure upon the various portions of them, after which he referred to lime, sand, and concretes. Mr. Parkin also referred at length to the construction of wooden roofs, and remarked that in future ironwork would without doubt be one of the architect's greatest features.

## TESSERÆ.

### Pompeian Decoration.

SIR M. D. WYATT.

WITH regard to the position which Pompeii and its decorations should occupy in the history of art, I may observe that we are too much inclined to speak of "the Pompeian style" as though the remains of Pompeii presented one style only; whereas it is difficult to imagine any more concrete phase of style than that of Pompeii. Originally a Greek colony, the town afterwards became amalgamated with its Samnite and Etruscan conquerors. It ultimately degenerated into a mixed race known as Campanian, and became subject to Rome; thus, in its various vicissitudes, obtaining some modification from each existing school of art. Altogether we have a most charming mixture of styles, and any person going carefully through the existing remains cannot but trace many forms which cannot be accounted for, unless they may have been derived from these mixed sources. In some paintings we find green and purple used with curious white lines, more Etruscan in its character than anything else; there is a good deal of Greek work about the tombs, and in the earlier portion of the buildings the Greek style of decoration was most prevalent, according with the monuments which M. Hittorff has illustrated in Sicily. The decorations in such cases are divided into compartments of flat tints, with central pictures, frequently surrounded by frets and ornaments of the kind, apparently derived from mosaic work. Subsequently the fashion changed with what was going on in Rome. In the time of Augustus Pliny relates that Ludius, a celebrated painter, introduced a system of arabesque decoration; and in the most fashionable houses of Pompeii that style appears to have been

carried to very great perfection. Upon this there supervened a more fantastic style, in which there is a quantity of architectural work indicated in thin lines in a most peculiar manner. The Cavalier Canina has attempted to demonstrate, from this style of decoration, that these lines were derived actually from existing models, and that the upper apartments and terraces of Pompeii, some of which were doubtless constructed of wood and gaudily painted, were the models upon which the style was founded. Hence he has endeavoured to demonstrate that every nation possessed, in addition to its severer style, an "architetina svelta," a thin style. This position is one which I think scarcely tenable, because these designs appear to be rather the fantastical conjectures of a person whose mind was filled with *concetti* than serious productions of any kind. Generally the colours at Pompeii are arranged in horizontal zones, the lowest being the darkest, the second intermediate in depth, and the uppermost the lightest of all. Perhaps the most striking characteristic of these works is the extraordinary exuberance of invention which they display. Hardly one moulding or ornament is like another, and even the two sides of the same ornament are seldom alike. This is an interesting circumstance, as proving that their artists did not trace their drawings on the wall, but drew them freely as their fancy dictated. This is further illustrated by one painting, engraved by Mazois, which represents an artist taking the portrait of a gentleman, which he is doing with outstretched arm and a free hand, and seated at a distance from the picture; whereas one of our own portrait-painters would be using the maulstick and resting his hand almost close to his canvas.

### Origin of Flints.

WILLIAM WHITAKER, F.G.S.

The flints of the upper chalk have ever formed a subject of speculation to geological inquirers. At one time thought to be of purely mineral origin, at another to have been deposited solely around organic matter, they are now generally accounted for by a mean between those two opinions; for whereas there is no doubt that the silica of which the flint is formed has very commonly been deposited around the remains of animal or vegetable organisms, whose substance, moreover, has often been replaced by flint, yet there are other cases, notably the more or less vertical or highly-inclined layers that run along joints in the chalk, in which a purely mineral origin is clear, the flint being simply deposited from solution along those lines. The flint in the chalk occurs in two forms: either as irregular-shaped isolated nodules, mostly in definite lines, but sometimes sparsely scattered, and often with an organic centre; or as continuous layers, mostly thin, but sometimes half a foot thick. As a rule the outer coat of flint is white and the inside of a dark colour; the white coating, though differing so much in look from the rest, is really of the same composition, the difference being simply caused by a molecular change in the condition of the silica, the particles of which would seem to have been rearranged through long continued, though partial, exposure to some external agencies. In the tabular layers of flints, however, there are sometimes alternations of black and white layers with some of the latter internal, in which case exposure would not account for the difference.

### Costume in Sculpture.

HENRY WEEKES, R.A.

A statue is not erected to commemorate the dress, but the man; it is sufficient, therefore, if the former be so indicated as to give the general impression of belonging to its wearer and his times. Such peculiarities in it as are unimportant, or offensive to good taste, or that detract from the broad treatment of the work, should be omitted or judiciously concealed. An artist of right feeling finds no great difficulty in this; though, perhaps, nothing serves so much to distinguish his work from that of inferior men as due attention in this particular. There are many kinds of modern dresses as well suited to sculpture as the most simple drapery, such as the robes of our princes and peers, our judges and clergy; and it is rarely that an opportunity is wanting in a statue of selecting one or other of these. Even the ordinary modern dress worn in our streets may, by a little modification and treatment, be so approached in marble as to give a general impression of identity, and yet not be ludicrous or offensive to those who may hereafter have to look at the work when the fashion shall have changed or entirely departed. Were a proof wanting that this is the correct method of solving the question, we might quote the opinion of Flaxman, as shown in his works. Though the most imaginative sculptor England, or perhaps the world, ever produced, his portrait statues are singularly literal; in fact, if they have a fault it is the too close adhesion to the detail of modern dress, evidently showing that he felt the sound judgment of not departing from those things that mark identity of person and period. His figure of Sir Joshua Reynolds in St. Paul's Cathedral is an instance of judicious choice of costume, and will bear comparison with most works of the English school; and his statue of Pitt is another instance of close

attention to this point, notwithstanding which it is a thoroughly characteristic work—simple and elegant, dignified and statesmanlike.

#### **Influence of Materials on the Architecture of London.**

SIR A. ALISON.

The unfortunate circumstance of stone or marble not being found in the neighbourhood of London has undoubtedly had a most prejudicial effect, not only on the durability but the character of its architectural edifices. If the freestone quarries of Craigleith, near Edinburgh, had existed at Highgate or Hampstead, not only would the metropolis have been constructed of lasting materials, but their solidity and cost would have stamped a character of simplicity and grandeur upon its architecture which constitute the only foundations of real excellence. It is impossible to construct long rows of whited sepulchres with stone. The meretricious and overloaded ornament of modern London would have been effectually banished by the mere use of a hard material for building. There is no end to stucco friezes or statues. It is easy to cast capitals, according to "Mr. Nash's positive order," in a mould, and whitewash them to resemble freestone; but it is not so easy a matter to play these antic tricks with solid masonry, or run the risk of destroying a sumptuous edifice by the ridiculous attempt to effect innovations in the Grecian orders. If the National Gallery in Trafalgar Square had been constructed of stone, it would never have exhibited the pepper-boxes and vitiated taste which make all Englishmen blush who recollect the Louvre or the Vatican. Had Buckingham Palace been built, as it should have been, of freestone or marble, it would never have exhibited that overloaded ornament and unbecoming proportion which, notwithstanding much beauty of detail, renders it no fit palace for the kings of England.

#### **Concrete Construction.**

ROBERT ABRAHAM.

The result of the experiments made during the progress of the works (at the Westminster Bridewell) was fully confirmatory of the views originally detailed in contract, which required an admixture of 1 part lime to  $\frac{3}{4}$  gravel, containing sand in the proportion of  $\frac{2}{3}$  of the aggregate, or, in other words,  $\frac{1}{3}$  lime,  $\frac{2}{3}$  sand,  $\frac{3}{4}$  gravel. Care and regularity in the execution of the work are of great importance, success very much depending upon the degree of precision and uniformity preserved in proportioning the components. It is, therefore, necessary that such a system be adopted of depositing the material on delivery, either in rectangular or other shaped heaps of uniform size, as will render obvious any deficiency of lime or sand, and be an invariable measure for the requisite quantity of water. The mode of throwing in the concrete is also important, very great advantage being obtained from the rapid consolidation arising from pressure when cast from a height, instead of being laid in steps or layers. The degree of expansion peculiar to concrete when thus executed may be noticed; this takes place immediately the operation of slacking has occurred, giving an urgent reason for the prompt use of the material after mixing, and showing the necessity of using the lime in a perfectly fresh and pure state; large landings are raised very perceptibly by this peculiarity, and the crown of a brick arch has been known to fracture from its effect. It must, however, be stated that this expansion occurs subsequently to an original loss of some magnitude upon the measure of unmixed material, 27 cubic feet of gravel (with its due proportion of sand included), together with 3 feet of ground lime and a little more than 4 cubic feet of water, yielding only 24 feet of concrete.

#### **Efflorescence on Walls.**

C. H. SMITH.

Under ordinary circumstances, it is scarcely possible to get rid of the various saline or deliquescent substances that have once been admitted into the walls of a building. The fixed alkalies (potash and soda) may probably be considered imperishable, no length of time can injure them; they may effloresce, or rather they may crystallise on the surface of a wall and totally or partially disappear again and again, as often as a change in temperature or of dryness or humidity takes place. These changes may be daily, or the salts may remain inactive during ages, and from some favourable cause a crop of crystals may be produced as vigorously as if the wall had recently been finished. The only way to abate the evil is to brush off the crystals whenever they appear to be in the most flourishing condition. If potash has been introduced into the walls either from the putrefaction of animal or vegetable substances, or from other sources, however thick the wall may be it will make its way to the surface, and then absorbing nitrogen from the atmosphere, which contains seventy or eighty per cent. of that substance, "nitrate of potash" or saltpetre is produced. Salts are generally communicated to a building in weak solutions. The water very gradually evaporates, carrying

with it from the interior of the wall the molecules that compose salt. The solution having arrived at the surface so as to be freely in contact with the atmosphere (always so essential to crystallisation), evaporation continues until the solution is sufficiently strong to crystallise, still leaving the mother water in the wall, which is indicated by a certain dampness.

#### **Treatment of the Upper Parts of Buildings.**

SIR C. WREN.

There are different reasons for objects whose chief view is in front, and for those whose chief view is sideways. Fronts ought to be elevated in the middle not the corners, because the middle is the place of greatest dignity and first arrests the eye, and rather projecting forward in the middle than hollow. For these reasons pavilions at the corners are naught, because they make both faults, a hollow and depressed front. Where hollows and solids are mixed, the hollow is to be in the middle, for hollows are either niches, windows, or doors. The first require the middle to give the statue dignity; the second, that the view from within may be direct; the third, that the vista may be straight. The ancients elevated the middle with a tympan and statue, or a dome. The triumphant arches, which now seem flat, were elevated by the magnificent figure of the victor in his chariot with four horses abreast, and other statues accompanying it. No sort of pinnacle is worthy enough to appear in the air but statue. Pyramids are Gothic, pots are modern French. Chimneys ought to be hid if not well adorned. No roof can have dignity enough to appear above a cornice but the circular: in private buildings it is excusable. The ancients affected flatness. In buildings where the view is sideways, as in streets, it is absolutely required that the composition should be square, intercolumniations equal, projections not great, the cornices unbroken, and everything straight, equal and uniform. Breaks in the cornice, projectures of the upright members, variety, inequality in the parts, various heights of the roof, serve only to confound the perspective and make it deformed, while the breaches and projections are cast upon one another and obscure all symmetry.

#### **Egyptian Art.**

W. A. BROMFIELD, F.L.S.

An extraordinary inequality of design and execution seems the prevailing characteristic of Egyptian sculpture and architecture. As for the paintings on the tombs and on the roofs and ceilings of the temples, I must confess that, with very few exceptions indeed, I never saw any that, to my eye, looked superior to vile daubs such as a country sign-painter might feel ashamed to have executed. Some of the figures of men and animals in processions, &c., are tolerably portrayed, chiefly in their peculiar subdued red or Etruscan vase colour; but whenever they attempt flowers, fruit, foliage, a scroll, or any complicated object requiring strong shading or relief, I have seen nothing but utter failure—flat, sandy, ungraceful designs. I know it is the fashion in England to talk of the extraordinary brilliancy and durability of these colours as being inimitable in these degenerate days, by the loss of the mode of their preparation, one of the pretended secrets of ancient art; but this assertion I have learnt to class with the customary ravings about Eastern skill, sunlights, shadows, moons, flowers, and fruits. The Egyptians knew nothing of oil paints, and all their water-colours that I have seen on the stucco or stone of their walls, whether in tombs or temples, have an opaque, earthy, or (what I believe artists call) muddy appearance, which argues no great skill or knowledge of the materials best adapted for yielding bright clear colours.

#### **The Windows in King's College Chapel, Cambridge.**

J. DALLAWAY.

The most magnificent series of windows in England, now existing in such a state of perfection, is that in King's College Chapel at Cambridge. There are twenty-three windows. Each window has six subjects taken from the Old and New Testaments, exhibiting analogous stories in the richest colours. The drawing is correct, and it is probable that they were finished by English artists from Flemish cartoons. These artists, at that time claiming only the humble appellation of glaziers, were furnished with excellent designs, which they procured from the Continent. Bernard Flower was the original undertaker of King's College windows, but died before their completion. Francis Williamson and Simon Symondes finished four of them at sixteenpence the square superficial foot. Galyon Hoone, Richard Bound, T. Reve, and James Nicholson undertook eighteen others, on the east and west sides, at eightpence the square superficial foot, as agreed by indenture, dated 1527. They are there bound to set these windows up "with good, clene, sure and perfyte glasse, and oryent coullours and imagery of the story of the old and new lawe, after the forme, maner, goodenes, curiosyte and clenelynes of the glasse windowes of the kinge's new chapel at Westminster."

## NOTES AND COMMENTS.

THE Glasgow District Board of Lunacy have decided that a limited competition among local architects is likely to be the surest way to obtain a good design for the new Hartwood Asylum. In response to the advertisement eighty-three architects sent their names, and the following gentlemen have been selected:—Mr. JOHN BAIRD, Messrs. BALDIE & TENNANT, Messrs. H. & D. BARCLAY, Messrs. JOHN BURNET & SON, Messrs. CAMPBELL DOUGLAS & SELLARS, Mr. BRUCE J. HAY, Mr. HENRY HIGGINS, jun., Messrs. LANDLESS & CLIFFORD, Mr. FRANCIS STIRRAT, and Mr. JAMES THOMSON. The conditions are that a premium of 50*l.* is to be paid to each competitor; that on payment of the premiums the respective designs shall become the absolute property of the District Board; that the District Board shall not be held as bound to execute the work according to any of the plans to be obtained; and that the District Board shall be at liberty to employ as architects for the buildings either any one of the architects competing or any other party. The conditions are extremely rigid, for they mean that by an expenditure of 500*l.* an enormous amount of labour will be undergone to the Board's advantage, while the chances of the competitors are put outside all calculations of probabilities. Every competitor has to contend not only against nine rivals, but against the mysterious "any other party." Whatever may be the result the Lunacy Board will win. Whether any one of the ten is also to participate in the joy of victory is another question. However, eighty-three architects were emulous to play the game of hazard.

THE fate of the Manchester Canal Bill is watched attentively by contractors, and with reason, for the works are estimated to cost 7,292,972*l.*, and there never was a time when so large an expenditure was more desirable. The greater part of the sum or 5,224,384*l.* is put down for the navigable canals; the docks are to cost 1,320,135*l.*; the deviations of railways and branches, 457,292*l.*; opening bridges, 129,942*l.*; new roads, 77,529*l.*; locks, diversions, &c., 83,691*l.* An undertaking of the kind is not merely an enormous amount of earthwork and masonry. It will require for its completion many warehouses, sheds, &c., and manufacturers would soon discover the advantage of erecting buildings in proximity to the canal.

AN American engineer, Mr. J. C. GOODRIDGE, jun., has published a pamphlet in which it is asserted that the Washington Monument, which was only lately completed, is unsafe. The shaft, he says, is 55 feet square, resting upon a loose mass of rubble masonry without tensile strength, and is stated in the reports of the engineers as unable to bear any transverse strain. Under this shaft of 55 feet square is left an opening 45 feet square. The walls of the monument are 15 feet thick, and the new foundation extends but 5 feet under this wall, leaving that portion of the shaft giving the greatest pressure as a dead load to be carried by the clay portion of the upper soil. The greatest weight comes where the new foundation stops. The load on the concrete is about 11 tons per square foot, or 200 lbs. per square inch, and if an allowance is made for wind pressure it rises to 14 tons. The concrete is considered to be ill-adapted for the work, as it is made up of one part cement, two parts sand, three parts pebbles, and four parts broken stone. Mr. GOODRIDGE says that it has been demonstrated that a monument can be raised to the height of 555 feet on such a soil as underlies the Washington Monument, but that it can be sustained there has to be proved. The constructors of the monument can reply that a great many structures have been proved to be in danger and by right should fall, but somehow they continue to exist.

In noticing the judgment of the Court of Appeal in the Whitechapel underpinning case, we suggested that it was not likely to be accepted unconditionally. The Lords Justices considered that the railway company were within their rights in underpinning a house, although the concrete was the counterfort of a retaining wall. In spite of the

precedent, the lessee of a house near the South Kensington Station applied, in the Vice-Chancellor's Court, to restrain the company from doing exactly the same kind of work in connection with the subway to the Horticultural Gardens. The plea of the company was the usual one—that they were acting under Parliamentary powers, and in the course of their operations had found it necessary to make these excavations, that the house had been carefully underpinned, and the excavation, as fast as made, filled in with concrete, &c. Vice-Chancellor BACON took the opposite view to the Court of Appeal in the former case, and decided that the company's proceedings were unlawful and unauthorised. An injunction was granted without any limitation.

THE "dowsers," or men endowed with the power of using the divining-rod, are supposed to have been extirpated by the advance of science. But members of the fraternity still exist in England, and it is possible to obtain a printed list of them. About a fortnight back a dowser named MULLINS, from Chippenham, exhibited his skill on the estate of Earl BEAUCHAMP at Madresfield, before a large party. He was armed with the forked branch of hazel which is the customary instrument of the diviners. MULLINS, who was a stranger to the place, was brought into the garden, and no sooner had he arrived at a spot which is above a reservoir for the supply of the house, than an indication of its existence was given by the turning of the branch. In a meadow having an underground pipe the same phenomenon was witnessed, and the movement was on one occasion so sudden as to break the hazel. It was found that a thorn-branch answered in the operator's hands, but hazel has the preference. The proceedings were conducted with simplicity, and there was nothing of the charlatan about the dowser in this case. He has turned his skill to account by discovering underground springs on Earl BEAUCHAMP's property, and he claims to have the power of discovering all minerals except silver by means of hazel. The usual explanation is to say that the divination is a delusion—and there is an end to inquiry. In this case there were several witnesses, and they could not all be deceived. It was observed that the movement was less apparent over water running through glazed pipes, and the difference suggests the operation of some cause which might be discoverable on investigation.

M. DE MAERE gives some fresh details about the projected Belgian canal of which we spoke last week. He states in *La Belgique Maritime* that Mr. LEE, who has had experience of such works at Cronstadt and St. Petersburg, has recently examined the project on behalf of an English company formed to execute the works, if it can get the necessary concessions from the Belgian Government. It is proposed to run the entrance piers out to a distance of 900 metres, and enlarge and deepen the port at the mouth of the canal. This, with the railway works, will, it is now estimated, bring the cost of the undertaking up to 44 million frs., or 1,760,000*l.* sterling. BUONAPARTE, it seems, used the central dock at Bruges to construct some of his gunboats wherewith to invade England, but the dock itself was completed in 1665.

A CORRESPONDENT of the *Scientific American* says that when constructing a new house last year, he had birch folding doors introduced against the protest of his architect, who had never heard of birch-wood being used for that or any analogous purpose. The result is most satisfactory to all parties, and to none more than the architect, who originally preferred the use of walnut or cherry. Possibly the builder took especial care in the selection of his material, so as to convince the architect of his error and his (the builder's) superior knowledge; but, however that may be, the black birch doors, which in texture resemble satin-wood, and in colour dark cherry, are the admiration of every one who has seen them. The correspondent may find that his architect was right, for, in spite of its appearance, black birch, the *Betula nigra* of the botanists, is not considered to be a wood that lasts, and, although there is little strain on folding doors, a wood that is much affected by time is out of place there.

DESIGN FOR LINCRUSTA-WALTON DECORATION.

THE mechanical perfection to which a material like Lincrusta-Walton can easily be brought has been hitherto the chief source of its shortcomings. Mechanical precision has been sought too exclusively, and obtained by the sacrifice of a certain softness of effect, which in less mechanically perfect manufacture is not difficult to get.

Mr. LEWIS F. DAY'S design, which we publish this week, and which was modelled in the artist's studio under his direction, is meant to prove that any hardness in Lincrusta designs is not inseparable from the material, which is capable of the most delicate, as of the most precise, workmanship. It will be seen that this design, which is a "drop" pattern, has been contrived so that the repeat is wider than the width of the material, by which means a bigger and broader effect is produced than would otherwise be possible within the same space.

The style adopted is Renaissance, but treated with a certain contempt for precedent, except in so far as there was something to be learnt from it.

AN ESSEX DOCTOR'S HOUSE.

OUR illustration is a reproduction of the architects' original sketches for a doctor's house recently erected, with some modifications, in Essex. The plan has been so arranged that the doctor's house, while easy of access from the residential part of the house, are quite distinct from it, the study, consulting-room, surgery, and waiting-room being *en suite* on the entrance front of house near the carriage entrance. It will be seen from the plan that the special features required in a medical man's house have been obtained by the architects in a very economical form. The detail of the internal fittings has been carefully studied, the sketches of which give a good idea of the work.

The building externally is faced with Reading bricks and red upright tiling, the roofs being covered with Broseley tiles.

The work has been satisfactorily carried out by Mr. D. TAYLOR, contractor, of Reading, from the designs and under the superintendence of Messrs. CHAS. SMITH & SON, architects, of Reading.

THE O'CONNELL CHURCH, CAHIRCIVEEN.

IT was lately proposed by the Very Rev. Canon BROSNAH that a memorial of the late DANIEL O'CONNELL should be erected in his native town. Subscriptions were sent from the Irish people in many parts of the world, as the building was considered to possess a national character. Mr. G. C. ASHLIN, A.R.H.A., was appointed architect, and we publish this week reproductions of two of his drawings.

## THE ARCHITECTURAL ASSOCIATION.

THE twelfth ordinary meeting of the Association was held on Friday evening, the 20th inst., Mr. Cole A. Adams, president, in the chair. The following gentlemen were elected members:—Messrs. M. E. Sellin, R. W. Roe, H. D. Wilkinson, W. G. R. Bousfield, T. Moore, J. W. Lee, F. E. Haarer, and R. H. Mew.

A letter was read from Mr. Thos. W. Aldwinckle, who wrote offering a sum of 20*l.* this year or next year for a travelling studentship, to be held under the same conditions as the Association Travelling Studentship.

A vote of thanks was awarded in connection with the previous visit.

Mr. PENROSE, M.A., then delivered a lecture on "Proportion in Architecture, especially as exemplified in the Works of the Greeks."

The lecture was listened to with great interest. It consisted in an explanation of drawings, and plans and sketches on the black-board. A report of the lecture will appear next week.

A Bridge is to be constructed over the River Jordan, near the ancient city of Jericho, by order of the Turkish Government. It will be 45 mètres long and 5 mètres wide.

## THE PARIS EXHIBITION OF 1889.

THE report by M. Antonin Proust, president of the commission appointed to organise the Universal Exhibition of 1889, has been published in the *Journal Officiel*. It deals first with the choice of a site. In conformity with the wish expressed by the Municipal Council of Paris that the exhibition should be on the Champ de Mars, the commission recommends that the site shall include, on the left bank of the Seine, the Champ de Mars and the space extending from the Avenue de la Bourdonnaye to the Ministry of Foreign Affairs, and, on the right bank of the river, the Trocadéro from the Avenue d'Antin to the avenue which bounds the Palais de l'Industrie on the side of the Place de la Concorde. The *concours*, requiring a wide space, should, in the opinion of the commission, be conducted at Vincennes.

With regard to the constructions which are to be erected, it is suggested that there should be two great divisions—first, those devoted to purposes connected with the manifestation of ideas; and, secondly, those devoted to the exhibition of products. The commission recommends that greater development should be given to conferences and international congresses, the success of which was great in 1878. The libraries, laboratories, and halls for the conferences will be placed near one of the entrances to the Palais de l'Industrie. There *fêtes* will be organised and prizes distributed. In the space comprised between the avenue parallel to the Place de la Concorde and the Avenue d'Antin all that relates to education will be grouped.

The Seine will divide the two great categories, the manifestation of ideas being on the right, and the exhibition of products on the left bank. The river will be crossed by a bridge doubling the Pont des Invalides, which by its height will not interrupt the traffic on the right bank. The esplanade of the Invalides will be devoted to the Colonial Exhibition, and to that of living animals, which will only last a fortnight. A part of the Quai d'Orsay and the Quai d'Alma will be the site of the Agricultural Exhibition. M. Tisserand has prepared a scheme for this section, the object of which will be to give exact ideas of the conditions and methods of culture in each country.

Two palaces will be erected, one near the Avenue de la Bourdonnaye, devoted to the arts, the other near the Avenue de Suffren, to the sciences. The commission, being consulted with regard to the permanency of a part of the constructions to be erected in the Champ de Mars, recommends that these two palaces just referred to should be preserved. It estimates at 50 millions the total of the expenses necessary for the various buildings to be constructed and fitted up. The receipts anticipated to cover these expenses are grants from the city and the State, 28 millions; admissions day and night, 14 millions; concessions, 15 millions; sale of the materials, 1 million—in all, 58 millions. Thus a profit will be left of 8 millions to meet contingencies.

The commission recommends that exhibitors should be made to pay for the space allotted to them, and that in return they should be allowed to sell their products. The report concludes with a proposal to found an Association de Garantie, with a capital of not less than 10 millions, and not exceeding 24 millions, to which, however, no appeal will be made until the 28 millions have been spent, and the total receipts of the exhibition have proved insufficient.

## ARCHITECTURAL COMPETITIONS IN THE POTTERIES.

WITHIN the last few weeks, writes a correspondent of the *Staffordshire Advertiser*, there have been two architectural competitions of some importance in North Staffordshire, one for two schools at Longton for the accommodation of 700 children in each, and the other for public buildings in Newcastle. In the former an expenditure of about 7,000*l.* is contemplated, and of about double that amount in the latter. These sums are to be provided out of rates, and therefore it is to be supposed that a great number of people are interested in them. With regard to Longton—for the present, at all events—all is over as to the selection of designs, which, to the number of twenty-three, were submitted on the 9th inst., and on the following day the School Board met at three o'clock and dispersed at five o'clock, having examined the designs, considered the reports and estimates, compared their several merits, and selected one set which in the unforeseen termination of events turned out to have been submitted by a son of the chairman of the Board. Immediately following this decision there appeared in the columns of a contemporary a letter from the rector of Longton, he being a member of the School Board, wherein it was stated that there had been a want of consideration in the selection, and that he had appealed in vain for more time, care,

and thought to be given to the designs. To wash his hands of the apparent stain he had written a formal protest to the Education Department. This letter moved the competitors to action, and they have resolved that if legal proceedings will avail them, they will not shrink from taking them. That a moral injustice has been done wants no argument to prove, as every one must see that the time given to the selection was altogether inadequate even for the greatest experts, had such been employed in the work.

In the Newcastle competition it has been decided to call in a professional adviser, and it is expected that the corporation will act on his advice in awarding the premiums. The drawings submitted in this case amount to no less than thirty-seven sets, and they average perhaps six sheets each, so that upwards of two hundred and twenty drawings have to be considered. No one can look round the room where the designs are hung without seeing that brains have been heavily taxed and hands busily employed to produce the schemes there displayed. As the awards have not yet been made it would hardly be fitting to enter upon a detailed criticism of the works submitted, but this may be done at another time. The subject is varied and a somewhat complex one, and the site is one of decided peculiarities. It is very irregular in form, having a long frontage to Marsh Street and a narrow one to the Ironmarket, and a roadway has to be provided out of the site between the two streets. This not only reduces the area of the site, but narrows the small frontage to the Ironmarket. All the designs show the communication between the two streets on the lower side of the land. More or less use is made of this private road for frontages, approaches, and other purposes. The principal portions of the proposed buildings are a large assembly-room, a free library, with reading-rooms, and two swimming-baths, and a number of private baths. Some of the competitors have added Turkish baths, which were not specified to be included in the instructions to architects. Nearly all the designs show the assembly-room on the first floor with its longer axis at right angles to the Ironmarket, with the accommodation for the free library below it. The baths are generally placed towards Marsh Street, but vary in their disposition considerably. One design differs from all the others by placing the assembly-room near the middle of the site in the shape of a large octagon, with a great reading-room beneath it. There are a few of the designs which evidently emanate from amateurs, but for the most part immense pains have been taken to master the subject, and in many instances great results have been accomplished in a masterly manner. The Corporation stipulated that the cost of the buildings and fittings is not to exceed 12,000*l.*; and that the commission would not be given to anyone whose plan could not be carried out for that amount *plus* 10 per cent. as a final margin. Perhaps all the best designs will have to go unpremiated on the score of excessive cost, but even then there will remain half a dozen sets at least which will well merit selection. An experienced assessor will by study be able to set aside the feeble, the impractical, and the unsuitable, and in the course of time to lay his finger on the three designs most marked for their grasp of the subject, its careful manipulation and masterly completion, taking strongest account of the question of cost. In this way the Newcastle Town Council will have been relieved of a responsibility which rightly attaches to professional skill only, and will have discharged a duty conscientiously; yet withal it may possibly be found that the buildings suited to their purposes, the site, and their purse have even yet to be designed.

## Bygones.

*"Antiquity after a time has the grace of novelty."*—HAZLITT.

### SIR HENRY WOTTON ON PAINTING AND SCULPTURE.

THE "Elements of Architecture collected by Henry Wotton, Kt., from the Best Authors and Examples" is one of the earliest English books on architecture, and is the more remarkable from being the work of an amateur. It is the fruit of long residence in Italy at a time when art was still a power. In 1590 Wotton first set out for the Continent, and he remained abroad for nearly nine years. "In Rome, Venice, and Florence," says his biographer, Isaac Walton, "he became acquainted with most eminent men both for learning and all manner of arts, as picture, sculpture, chemistry, architecture, and divers other manual arts, even arts of inferior nature, of all which he was a most dear lover and a most excellent judge." When James the First became king, he resolved to employ

Wotton as an ambassador, and he was offered France, Spain, or Venice. He selected the last for "best suiting with his genius, who did ever love to join with business study and trial of natural experiments, for which Italy, that darling of Nature and cherisher of all arts, is so justly famed in all parts of the Christian world." Wotton lived in Venice for about twenty years. He returned about the time of James's death, bringing with him some German and Italian artists, and it would seem as if the payment to them impoverished himself. Wotton was fortunate in obtaining the provostship of Eton, where, says Walton, "his very food and raiment were plentifully provided in kind, where he was freed from corroding cares, and seated on such a rock as the waves of want could not possibly shake." It was at Eton he wrote his book on architecture. Having no longer despatches to indite, he needed some employment for his pen, and as he was too honourable a man to write revelations of courts and courtiers, he selected architecture as a theme. He was aware of the objections that could be raised against him as an amateur, and it is evident Wotton feared some might think that his love of the art never induced him to patronise builders. "I must shrink up to my shoulders," he said, "as I have learned abroad, and confess indeed that my fortune is very unable to exemplify and actuate my speculations in this art." His book was written for amateurs, and it was received with much commendation. The following extract, although one of the most interesting passages in the book, is not so well known as the remainder. In writing of pictures and statues in relation to architecture, Wotton was speaking of what he had studied, and he was less of a bookmaker than when drawing information about the orders from Vitruvius:—

First, therefore, touching painting, there does occur a very pertinent doubt, which has been passed over too slightly not only by some men, but by some nations—namely, whether this ornament can well become the outside of houses, wherein the Germans have made so little scruple that their best towns are the most painted, as Augusta and Nuremberg. To determine this question in a word. It is true that a story well set out with a good hand will everywhere take a judicious eye; but yet withal it is as true that various colours on the out-walls of buildings have always in them more delight than dignity. Therefore I would there admit no paintings but in black and white, nor even in that kind any figures (if the room be capable) under nine or ten feet high, which will require no ordinary artist, because the faults are more visible than in small designs. In unfigured paintings the noblest is the imitation of marbles, and of architecture itself, as arches, friezes, columns, and the like.

Now for the inside, there grows another doubt, wherein grotesque (as the Italians) or antique work (as we call it) should be received, against the express authority of Vitruvius himself (lib. 7, cap. 5), where "Pictura," he says, "fit ejus quod est seu potest esse," excluding by this severe definition all figures composed of different natures or sexes, so as a siren or a centaur had been intolerable in his eye. But in this we must take leave to depart from our master, and the rather because he spoke out of his own profession, allowing painters (who have ever been as little limited as poets) a less scope in their imaginations even than the gravest philosophers, who sometimes do serve themselves of instances that have no existence in nature, as we see in Plato's "Amphisbæna" and Aristotle's "Hirceo-cervus." And, to settle this point, what was indeed more common and familiar among the Romans themselves than the picture and statue of *Terminus* even, one of their deities?—which yet, if we well consider, is but a piece of grotesque. I am, for these reasons, unwilling to impoverish that art, though I could wish such medley and motley designs, confined only to the ornament of friezes and borders, their most proper place. As for other storied works upon walls, I doubt our clime be too yielding and moist for such garnishment. Therefore leaving it to the dweller's discretion, according to the quality of his seat, I will only add a caution or two about the disposing of pictures within.

First, that no room be furnished with too many; which, in truth, were a surfeit of ornament, unless they be galleries, or some peculiar repository for rarities of art.

Next, that the best pieces be placed not where there are the least but where there are the fewest lights; therefore, not only rooms windowed on both ends, which we call through-lighted, but with two or more windows on the same side, are enemies to this art; and sure it is that no painting can be seen in full perfection but (as all nature is illuminated) by a single light.

Thirdly, that in the placing there be some care also taken how the painter did stand in the working, which an intelligent eye will easily discover, and that posture is the most natural; so as Italian pieces will appear best in a room where the windows are high, because they are commonly made to a descending light, which, of all others, doth set off men's faces in their truest spirit.

Lastly, that they be properly bestowed for their quality, as fitly for their grace: that is, cheerful paintings in feasting and

banqueting-rooms; graver stories in galleries; landscapes and bosage and such wild works in open terraces, or in summer-houses (as we call them), and the like.

And thus much of painting, which let me close with this note, that though my former discourse may serve, perchance, for some reasonable leading in the choice of such delights; yet let no man hope by such a speculative erudition to discern the masterly and mysterious touches of art but an artist himself; to whom, therefore, we must leave the prerogative to insure the manner and handling, as he himself must likewise leave some points, perchance of no less value, to others; as, for example, whether the story be rightly represented, the figures in true action, the persons suited to their several qualities, the affections proper and strong, and such like observations.

Now for sculpture, I must likewise begin with a controversy as before (falling into this place), or let me rather call it a very meet fancy, strangely taken by Palladio, who having noted in an old arch or two at Verona some part of the materials already cut in fine forms and some unpolished, doth conclude (according to his logic) upon this particular, that the ancients did leave the outward face of their marbles or freestone without any sculpture till they were laid and cemented in the body of the building; for which likewise he findeth a reason (as many do now and then very wittily even before the thing itself be true) that the materials being left rough were more manageable in the mason's hand than if they had been smooth, and that so the sides might be laid together the more exactly; which conceit, once taken, he seems to have further imprinted by marking in certain storied sculptures of old time, how precisely the parts and lines of the figures that pass from one stone to another do meet, which, he thinks, could hardly fall out so right, forgetting, while he speaks, of ancient things, the ancient diligence, unless they had been cut after the joining of the materials. But all these inducements cannot countervail the sole inconvenience of shaking and disjoining the commissures with so many strokes of the chisel, besides an incommodious working on scaffolds, especially having no testimony to confirm it that I have yet seen among the records of art. Nay, it is indeed rather true that they did square and carve and polish their stone and marble works even in the very cave of the quarry, before it was hardened by open air. But (to leave disputation) I will set down a few positive notes for the placing of sculpture, because the choosing hath been handled before. That first of all it be not too general and abundant, which would make a house look like a cabinet, and, in this point, moral philosophy which tempereth fancies is the superintendent of art. That especially there be a due moderation of this ornament in the first approach, where our authors do more commend (I mean about the principal entrance) a Doric than a Corinthian garnishment, so as if the great door be arched with some brave head cut in fine stone or marble for the key of the arch, and two incumbent figures gracefully leaning upon it toward one another, as if they meant to confer. I should think this a sufficient entertainment for the first reception of any judicious sight, which I could wish seconded with two great standing statues on each side of a paved way that shall lead up into the fabric, so as the beholder at the first entrance may pass his eye between them. That the niches if they contain figures of white stone or marble be not coloured in their concavity too black. For though "*Contraria juxta se posita magis illucescunt*" (by an old rule), yet it hath been subtly and indeed surely noted, that our sight is not well contented with those sudden departures from one extreme to another; therefore, let them rather have a dusky tincture than an absolute black.

That fine and delicate sculpture be helped with nearness and gross with distance, which was well seen in the old controversies between Phidias and Alcmeneas about the statue of *Venus*, wherein the first did show discretion and save labour, because the work was to be viewed at good height, which did drown the sweet and diligent strokes of his adversary—a famous emulation of two principal artists celebrated even by the Greek poets.

That in the placing of standing figures aloft, we must set them in a posture somewhat bowing forward, because (says our master, lib. 3, cap. 3, out of a better art than his own) the visual beam of our eye extended to the head of the said figures, being longer than to the foot, must necessarily make that part appear further; so as to reduce it to an erect or upright position there must be allowed a due advantage of stooping towards us, which Albert Dürer has exactly taught in his fore-mentioned geometry. Our Vitruvius calls this affection in the eye a resupination of the figure, for which word (being in truth his own, for aught I know) we are almost as much beholding to him as for the observation itself: and let thus much summarily suffice touching the choice and use of these adorning arts. For to speak of garnishing the fabric with a row of erected statues about the cornice of every contignation or storey were discourse more proper for Athens or Rome in the time of their true greatness, when (as Pliny records of his own age) there were near as many carved images as living men; like a noble contention, even in point of fertility, between art and nature, which

passage does not only argue an infinite abundance both of artists and materials, but likewise of magnificent and majestic desires in every common person of those times more or less according to their fortunes; and true it is indeed that the marble monuments and memories of well-deserving men, wherewith the very highways were strewn on each side, was not a bare and transitory entertainment of the eye, or only a gentle deception of time to the traveller, but had also a secret and strong influence, even into the advancement of the monarchy, by continual representation of virtuous examples; so as in that point art became a piece of State.

## DESIGNS FOR METAL WORK.

THE following evidence was given by Mr. A. A. Willms before the Royal Commission on Technical Instruction:—

Mr. Willms, you are the chief artist in the firm of Messrs. Elkington & Co.?—Yes.

How many years have you held that post?—About 26 years.

Previously to that you were similarly employed in France?—I had the good fortune to be trained amongst the great decorative artists of France; amongst others Constant, Didier, Hugues, Protat, and Klagman.

Were you employed in France in designing for any special trade, or as a general designer?—In France we design for everything. I was really a sculptor and learnt modelling, and at the '48 revolution I was just completing my education, when I came to London.

At the age of 18 you were earning money as a designer?—Yes.

What was your training as a designer from the age of 14 to 18?—More for silversmiths' work and brass work.

Where did you receive your artistic education?—In Paris with some of those artists whose names I have mentioned above.

In their *ateliers*?—Yes; I was assisting at the decoration of the Louvre and other buildings. Till '48 I was in Paris. In the year 1848 I left Paris and came to London, and was there for three years.

What was your employment during those three years?—I worked for Messrs. Morell, silversmiths, in New Burlington Street.

Whilst you were engaged in the *ateliers* of these great designers did you also attend the art classes in Paris?—Yes; in Paris we had only one very prominent school, Lequien.

Was that a public school?—Yes, in the Marais quarter. It was a public school in the sense that everyone could attend it?—Yes.

Was it a cheap school?—It was very cheap, but there was something to pay.

Subsequently the city of Paris took over that school?—Yes, it was taken over by the city of Paris, and then it became a free school.

When you were employed in England as a designer, your mind was cultivated by contact with that of English designers, but you attended no school?—Yes.

After having been three years in England you returned to France?—Yes.

What was your employment on your return to France?—I started a studio for myself.

You had a studio in which you prepared designs for some of the great manufacturers of Paris?—Yes.

Were the young men whom you employed instructed exclusively by you or did they attend the art schools which existed in Paris at that time?—Many were students from the art schools, but they were principally from other studios.

You employed a number of artists whose instruction had been completed, and you had also apprentices whom you instructed?—Yes.

What was the course of instruction you gave to these apprentices?—Working in plaster, and drawing and modelling. I taught them especially to give great finish to the plaster models, in order that there might be sharpness in the castings.

Was the instruction which you gave to these apprentices similar to that which is now given in the art schools in Paris?—Yes; but they were constantly employed on such easy work as chandeliers, for instance, and objects for actual use.

In addition to the theoretical instruction which they received, your apprentices were at once employed upon the execution of useful works?—Yes.

You think that the students in the French *ateliers* get on more quickly than the students in any art school?—Of course.

Had the apprentices generally, before they came to you, any knowledge of drawing?—Yes, generally.

You chose your apprentices amongst those who had already

some knowledge, and who showed considerable ability in drawing?—Yes.

Do you consider it necessary for the designer that he should have a good theoretical and practical knowledge of art?—Of course.

A man must understand the principles of art and be a ready executant before he can commence the practice of design?—Yes; there are very few original designers who are worth much unless they have received a training in art.

Are you acquainted with the system which is now pursued in the art schools of Paris?—Yes; one of my friends who has taken the Prix de Rome is now at the head of the school of jewellers and silversmiths.

Is that established by the jewellers and silversmiths?—Yes.

That school is essentially a school of drawing?—Yes, and of designing.

The young men who receive instruction in that school apply the instruction they have received there to designing work, and for that work, I believe, the guild of silversmiths offer prizes?—Yes.

Is that similar to what is done by the Goldsmiths' Company in this country?—The apprentices in the goldsmiths' trade and the jewellers' trade have a school to themselves, and this is situated in the workmen's quarter.

But that school, established in a quarter convenient for the workmen, does not differ greatly from the art schools established by the municipality?—Not at all.

They are not specially taught designing for the trade?—They do not receive any special instruction in designing for silversmiths' work. They are taught general designing, and can apply this. Many of their special works are done on Sundays.

In point of fact the instruction given to these young men is of the same kind as that which is given in the art schools in Paris?—Yes.

You are acquainted, of course, with the instruction in the Birmingham Art School?—Yes.

How do you compare the instruction given in the Birmingham Art School with the instruction in the municipal schools in Paris, and in the jewellers' school in Paris?—It is very much the same. Mr. Jackson, the assistant master, is well acquainted with drawing, designing, and metal work, and knows how to direct. Mr. Jackson was with me 18 years before going to the School of Art as a teacher.

You consider Mr. Jackson a very competent master, and that the methods he pursues under the direction of the Science and Art Department are calculated to produce good designers?—Yes.

From your own experience have you any suggestions to make as to anything that might be done to make that school more efficient?—There are some things which could be introduced. Mr. Jackson addresses himself so well to practical work that he is able to do anything required, and he usually consults with me on matters with respect to which he desires advice.

You consider that one great advantage he possesses in directing the art instruction of a manufacturing town like Birmingham is that he is in contact with those who are executing designs for these manufactures?—Yes.

You consider that in order to form a good designer two things are essential—the first, that he shall have a good knowledge of art and a considerable facility in execution; and, secondly, that he shall understand the nature of the trade to which that art is to be applied?—Yes.

Have you visited the French schools in recent years?—I have only visited the school of M. Fossey.

How long is it since you visited the jewellers' school?—At the beginning of the last year.

You are acquainted with the system pursued in the jewellers' school in Paris?—Yes.

Has it occurred to you that there is more rapidity of execution by the students in that school than in the Birmingham school?—I have met with some men who are really adroit, and can do anything, but it depends on the nature of the men.

You are acquainted with the conditions of the South Kensington competitions?—Yes.

Do you think that more minuteness of finish is required by the South Kensington authorities than is necessary for the training of a good designer?—I never thought that great minuteness of finish was a good thing. The system which was formerly adopted of requiring great minuteness of finish is a waste of time, and I believe that that system has now been modified by the authorities of South Kensington, and the degree of finish now required is necessary. I speak of the school studies.

Can you trace any good effects from the Birmingham School of Art on the industry with which you are connected?—Yes, certainly. I have seen many young workmen who have become good designers, and who have become much better workmen, simply because they have learned in the School of Art. I have two workmen now who are good designers. The art teaching has certainly produced good results. Several of

the men have taken prizes offered by the Goldsmiths' Company.

Do you know anything of other decorative trades carried on in Birmingham?—I generally award the special prizes at the School of Art, and I so see the progress that is made. There are at the school more designers than there were some years ago.

I understand that Mr. Taylor gives instruction in the School of Art in painting. What do you consider to be the influence of this teaching with respect to industrial art?—I think that this has rather tended to diminish the amount of instruction given in designing.

Do you consider that to be desirable, in a town like Birmingham?—No; the object of the South Kensington instruction in art is not to make artists but to train designers, and any encouragement to painting, unless it be of the decorative class, interferes with the more important teaching of design.

You think that they become artists of a certain degree instead of becoming designers?—Yes.

Would you think it desirable that the students in the School of Art should learn chasing before they come to the works of Messrs. Elkington?—It would certainly be a good thing for them to do so. In Paris they intend to have a school for practical chasing and metal work.

You think that they would be more useful to Messrs. Elkington if they came to their works with more skill in chasing?—Certainly. Mr. Elkington said he should be quite ready to take any man already prepared.

Do you think it better to learn chasing in the works or in the school?—If they had a good master, and were sufficiently advanced, it might be done in the school. But they will never be so clever as they will become by the production of real practical work in the shop. Messrs. Elkington have now expert workmen, but when I came they had about thirty Frenchmen.

How have these workmen been trained?—They have been trained by practice. They have been apprentices, and as their abilities revealed themselves they have taken to that department which they have had a particular turn for. Some have become chasers, some casters, some damasceners, &c.

Where do you consider the young men can be better trained, in the workshop or in the school?—It will always be effected more quickly in the workshop. But it would be a good thing if you could take them while they are at school and give them an idea of the work in which they will in after life be engaged.

If they are at school they are earning nothing, and if they are in the works they are earning something?—Yes; still it would be an advantage if they could learn something of chasing in the school. It would be of considerable value if they could come with some knowledge.

Is there any other technical branch of metal-work which could with advantage be taught in the Art School in addition to chasing?—Yes, engraving might be taught, and all the other branches of metal-work in an equal degree. Fitting requires great care and skill.

Are there any apprentices at present received in Messrs. Elkington's works?—We take apprentices, but we do not care for them, because they so often turn out unsatisfactory. Formerly plenty were taken. Of course I mean bound apprentices. We find it is better to employ men rather than boys.

Would you say that English boys have as much natural aptitude for artistic work as French boys?—Yes.

An English boy who has had the same chance of education as a French boy would make as good a designer?—Yes.

Are there many Frenchmen employed for designing purposes in Birmingham?—I do not know that there are any.

Thirty years ago were many employed besides at Messrs. Elkington's?—Yes, there were some at Winfield's, some at Chance's, and some at Stourbridge and Kidderminster.

Would you say that there are as many art workmen employed now in Birmingham as formerly?—More.

Are they all English now?—Yes.

Where have they been trained?—Generally at the School of Art.

Would you say that the improvement in design and in art workmanship in England is mainly due to the schools of art?—Yes, certainly.

Would you say that there is much difference between English and French taste in art, taking your branches of silversmiths' work and brass work?—Yes; it is necessary that we should make a certain compromise between different styles, whilst in France they adhere much more strictly to pure styles. There is more fancy work in England. The furniture of England is much more advanced than the French.

Take Hardman's, and people executing work of that kind in brass and iron; do you consider that the English may rival the Continental work?—Yes; they generally take the earlier thirteenth century period, whereas in France they take the more florid Gothic.

You say that Messrs. Elkington prefer to take workmen who are already trained?—Yes.

Where are these workmen trained?—They come from different places. If a man applies for a situation we take him, and if he shows ability we keep him. One artist modeller came from London; one was a pupil of Carrier, and was trained at Stoke (Minton's).

With respect to your chasers, &c., where do you get them from?—Some from London; most of the best have been trained by the firm, by contact with the French people.

With respect to those who come from other works, are you aware how they have been trained?—They have been trained at Birmingham by attending the School of Art, &c. Even some enamellers went to the School of Art.

How do the chasers now obtain their knowledge of their trades?—Generally it is under other workmen.

They serve a kind of apprenticeship?—Yes. Large firms give freedom to workmen to take boys to work under them. Messrs. Elkington allow the men a certain annual sum to teach them.

You were away from England from 1852 to 1857?—Yes.

Did you find on your return that great progress had been made during those years?—Yes, I found that considerable progress had been made.

To what do you attribute that progress?—It was certainly due to the great collections at Marlborough House and the commencement of art schools. Everybody was started in art work by these exhibitions.

You already realised an improvement in artistic design?—Yes.

Was that influence not also due to the importation of French designers after the Exhibition of 1851?—Yes, of course that helped, combined with the enterprise of certain well-known firms.

You attribute the improvement in English design to the joint influence of French designers employed in England and the collections that were being formed?—Yes, of course. Indeed, Mr. Redgrave stated in his report on the Exhibition of 1855, with respect to the improvement then manifested:—"It would be unjust and ungenerous, in making this comparison between the two countries, to pass without remark the valuable assistance which British manufacturers have derived in matters of art and taste from foreign artists and workmen, and which our manufacturers themselves are always quite willing and desirous fully to acknowledge. Not only is this the case in the supply of designs for many of our great manufactures, but by the actual engagement of skilled foreigners, both artists and men of science, in many of our large manufactories." And he proceeds to name a number of artists then engaged in the direction or the production of works for the English manufacturers, to which I have added a few others omitted by him:—A. Vechte, E. Jeannest, A. Carrier, J. Arnoux, E. Prignot, H. Protat, Joyeau, E. Phoenix, Constant, Willms, Vernez, and J. Fossey.

### THE CROSS OF EDINBURGH.

AT the meeting of the Town Council of Edinburgh on Tuesday, the following letter from Mr. Gladstone was read:—

"10 Downing Street, Whitehall, March 21.

"Dear Lord Provost,—I have to request of your lordship and of the Council the favour of being allowed to undertake the restoration of the Mercat Cross. As your great historic city is the capital of Midlothian no less than the kingdom of Scotland, I earnestly desire, in the character of the representative of the county, to leave behind me this small but visible record of grateful acknowledgment and sincere affection, conferred in a form closely associated with local and with national traditions. The site which has been suggested to me as most suitable is the entrance to Parliament Square. I trust that my application will be most favourably entertained, and I have the honour to remain, my dear Lord Provost,

"Your most faithful and obedient,

"W. E. GLADSTONE.

"The Right Hon. the Lord Provost of Edinburgh."

The Council unanimously agreed to the proposal.

The Cross of Edinburgh was erected in 1617, to replace an earlier building of the same description which was removed by the civic authorities in order to widen and otherwise improve the High Street, on which it encroached. The Cross of 1617 consisted of an octagonal tower, 16 feet in diameter and about the same in height. That which gave it character, however, was the tall, slender shaft, surmounted with the royal unicorn, which rose from the platform on the top of the tower, and which formed the original Cross. On this platform the heralds and pursuivants assembled to make proclamation of royal edicts. There, also, criminals were punished by scourging, maiming, and execution. In course of time this Cross, like its predecessor, was found to interfere with the street traffic, and it was ordered to be demolished in 1756. The carved stones taken from it were much prized by antiquaries, and several of

them found their way to Abbotsford, where they were built into garden walls and incorporated with fountains. The pillar was unfortunately broken when in course of being lowered to the ground. The fragments of it lay for many years in the private grounds of a mansion near Edinburgh. A few years ago they were put together again, at the expense of Dr. David Laing, and the shaft was reared on a low pedestal within the railings on the north side of St. Giles's Cathedral, where it now stands. The original site of the Cross is marked by an octagonal device in the paving of the High Street, and at that spot royal proclamations are still made, and other ceremonies required by law to be "done at the Cross" are performed. The tower which it is proposed to restore is not that described in the fifth canto of "Marmion," though it also, according to Scott, was "a turret octagon," but is the more recent structure built in 1617. The "pillar'd stone," however, which is really the City Cross, is of very old date, and belonged to the original structure.

### EDINBURGH ARCHITECTURAL ASSOCIATION.

A PAPER on "Timber-front Houses to Lawnmarket and Milne's Court" was read by Mr. William Bruce, clerk of works, at the meeting of the Edinburgh Association on Monday. The author said that he had been employed at the additions recently made to the Free Assembly Hall. He was allowed to make plans, elevations, sections, &c., of the old buildings before they were demolished, and he thought every one would regret to see those relics of bygone years disappearing. He desired to mention a few of the ancient buildings which he hoped some members of the Association would keep a record of, or make carefully-measured drawings, showing all the old construction as well as the general design. Among the number thus commended to the notice of the Association were the house occupied as Ward's Lodging-house, High Street; John Knox's house; the old Playhouse, and others which had, more or less, timber framing and projections. Mr. Bruce proceeded to describe at considerable length the outstanding features of ancient structures in Milne's Court and vicinity, touching upon, in turn, the mason, joiner, plaster, and painter-work. Although, he said, there were numerous valleys on the roofs, the builders did not seem to have used any plumber-work there, and no such thing as flushing had evidently been thought of. As to slater-work, he said the timber-front house to the Lawnmarket was roofed with grey slates fixed with pins to pine battens, the slate pins being about an inch in diameter. Regarding the carpenter and joiner-work, he remarked that the advantage of good oak pins was noticeable. Some of the vaults in Milne's Court when opened up about two years ago were more like cesspools than vaults, and if all the vaults in old Edinburgh had sewerage discharged into them similar to those in that locality at that time, the sooner they were swept out of existence the better it would be for the poor people who inhabited the houses near those hot-beds of disease. He earnestly hoped that each and all of them, individually and as an Association, would expose and use their influence for the complete removal of all such deadly nuisances when discovered. At the close the thanks of the meeting were conveyed to Mr. Bruce by Mr. Browne, the president of the Association, who was in the chair.

### LAY OPINION ON ARCHITECTURE.

A PAPER on "Architects and Architecture" was read at the meeting of the Leeds and Yorkshire Architectural Society on Monday, by Mr. Walter Smith, Art Director of the Bradford Technical College. Mr. Smith began his address by referring to the progress and development of modern architecture in this country and in Leeds, and making some suggestions concerning the status and education of the architect, proceeded to congratulate all lovers of architecture upon the probability that the number of competitions was likely to be curtailed, by the profession generally refusing to compete unless a professional assessor were employed to report on the plans submitted. Architecture, Mr. Smith proceeded to observe, might be regarded as the parent of all the arts, not being influenced by the subordinate arts as it influenced them. After referring to the great revival of Gothic architecture and its kindred arts during the past 40 years, and repudiating the idea of partisanship having regard to styles, Mr. Smith said that contrast of style gave greater interest to a street façade. Alluding to the low state of architecture in Leeds as it existed prior to the erection of the Town Hall, and the impulse given by the latter building to a desire for better buildings, the lecturer proceeded to deal with the question of brick *versus* stone as a building material for manufacturing towns, and gave the preference to pressed bricks and terra-cotta and tile enrichments. With regard to the professional status of the architect, the lecturer remarked that

much required to be done. The profession needed safeguarding, as was the case with the lawyer, the doctor, and the soldier. All men should be debarred from entering it until they had displayed the necessary qualifications. Architectural associations ought to be able to do much to elevate the status of the architect, and he strongly advocated the practice on the part of pupils of drawing large cartoons in charcoal from the antique and living models, sketching and designing in clay of enrichments, and the like. After referring to the increased opportunities in the present day of acquiring professional knowledge, Mr. Smith concluded his address by expressing a wish that the Leeds Association might continue its successful progress. The usual vote of thanks to the lecturer concluded an exceptionally interesting address.

### NATURAL GAS.

THE use of natural gas as a means of heating has been attempted with success in some parts of the United States. This gas as a fuel has a history, but its importance has received recognition but recently. Where a steady flow has been struck the profits are very large and the outlay very small. One company in Pittsburgh, extended over one ward (a very small area), has an income of 300,000 dols. per annum. Taking coal at 5 cents per bushel, 1,000 cubic feet of gas is worth 8 cents, this making the flow of the largest well, Westinghouse, with a flow pressure of 17 lbs., worth 1,200 dols. per day, or upwards of 400,000 dols. per annum. The "gas belt" is stated to extend from the Pennsylvania oil regions in a south-easterly direction to the oil regions of West Virginia. The gas cannot always be struck within this belt. Instances are known of where two wells, sunk 100 feet from each other, one was a success and the other a failure. One drawback growing out of the indiscriminate sinking of wells is that abandoned holes fill with water and tend to seriously interfere with adjoining operations. The eagerness of owners of property near a producing well to secure their share of the gas stored underground simply leads to repeating the outlay to reach it. In some quarters there is a movement to consolidate interests with a view to systematic development.

These liquid or aeriform hydro-carbons belong to the same geological series as the bituminous coalfield, extending even to the shales of New York and the salt formations of New York, Michigan, and West Virginia, and probably to all the western bituminous coalfields. The remarkable discoveries of gas in and near Pittsburgh recently made are treated by some writers as novelties, but in fact they are enlarged illustrations of what was well known and frequently utilised in Central and Western New York as early as 1840. Many private houses burned gas as fuel in Ontario and Wayne counties, New York, and the towns of Fredonia and Westfield, Chautauqua county, have for nearly forty years been lighted by natural gas found in the shales of the carboniferous series cropping out there. Also, in Virginia, the salt works of the Upper Great Kanawha Valley have been boiled by the blowing gas of the coal formations there since about 1850, the stratum yielding gas being pierced at a depth in that valley of one to two thousand feet. Gas was known and utilised, in fact, long before the oil was believed to have commercial value, although both gas and oil belong to the same geological era, and are almost interchangeable under some conditions. Gas wells were utilised in Eastern Ohio forty years ago, but they were not so valuable as those in the New York shales and at Erie, Pennsylvania.

Twenty-five years after natural gas was found and made valuable, the discovery of petroleum threw everything else into the background, and the hundreds of gas wells developed in boring for oil were almost neglected. The gas was allowed to waste, and when oil was not found the borings were filled up. All the petroleum formations are full of gas, and the time has come to utilise it simply as fuel. The Pittsburgh basin is a vast reservoir of natural gas, which probably extends to Kanawha on the south, and indefinitely westward beneath the bituminous coal-fields and the underlying shales. It is as great a property possibly as the oil, and it is co-extensive with the coal. While its transportation to great distances does not now appear practicable, it must be remembered that oil has had a victory over natural impossibilities in the pipe-line transportation that may prepare us for gas-pipes hundreds of miles in length. It is noticeable that the sandstones and shales surrounding the coal-fields proper are all more or less charged with natural gas. The want of its practical use is, therefore, likely to be even wider than the coal-mining or oil-yielding fields.

Scientific definitions of the quality and compositions of this gas are few. It is a simple hydro-carbon, entirely free from sulphur, and almost absolutely pure. In combustion it yields no smoke or soot, and it does not blacken the stove or the fixture in which it is burned. The heat is intense, without the necessity of blowing oxygen or superheated steam into the furnace to make the combustion perfect. With its well-known superiority in this respect, it is surprising that it has not been

sought for by many smelters of refractory metals, steel makers, and others. On the Great Kanawha the long ranges of salt pans are heated with the precise scale of decreasing temperatures desired to bring the liquid slowly to crystallisation at the remoter pans while very hot when first struck by the gas.

The excitement created at Pittsburgh by the gas wells recently struck there indicates a systematic attempt to utilise it in the iron and steel works in place of coal. In the first trials the gas was brought a long distance from Butler county, and for several years Messrs. Spang, Chalfant & Co. have used it in their rolling mills at Sharpsburg. The Oliver-Roberts wire rod mill, of South Pittsburgh, began using it on June 14, and the Jefferson Iron Works, of Steubenville, Ohio, have struck a very large vein of gas, which they are prepared to use. The Westinghouse well, at Pittsburgh, recently struck, is considered ample proof of the abundance of the supply within easy reach of the ordinary boring machinery for all the requirements of the vast iron and steel industries of Pittsburgh and its vicinity. The calculated value of the gas flow of the Westinghouse well as fuel is 1,200 dols. per day, or 400,000 dols. per annum, which is an easier form of raising fuel than by mining so much coal.

Many incidents as to the development of gas in salt boring and coal mining are brought to light in the notices already made public, one important case being as far south as St. Stephens, in Southern Alabama, where the salt wells opened during the late war showed great quantities of gas. The whole of Western Alabama abounds in coal, oil, and gas, and probably the entire basin of the Mississippi, wherever salt water or coal is found, will be available as a source of natural gas.

The use of petroleum for purposes of ordinary heating is rapidly increasing, and all the devices employed for effecting combustion convert the oil into gas as the first step. When this change is effected in pure oils the gas is precisely like the natural gas, and its combustion is without soot or other deposit. When natural gas cannot be found the oil can be used economically as the cheapest of all fuels, in fact, other than gas, since there is no waste, and there need be no heat generated which is not utilised. The natural gas of the blowing wells, however, is incomparably cheaper than oil can be, and if developed as rapidly as now appears likely, it will revolutionise the industries of the Mississippi Valley. The combustion of natural gas is nearly perfect, what little flame there is attending its burning being of a pure rose colour, and almost entirely free from smoke. The experiments thus far made have not satisfactorily demonstrated the relative merits of gas and coal as fuel, but the results from such trials as have been made are largely in favour of the natural gas.

The town of East Liverpool, Ohio, about forty-five miles from Pittsburgh, was the first to utilise natural gas for heating and lighting purposes. Imbued with the idea that their town was on the oil belt, numerous wells were sunk some twenty-five or twenty-six years ago, which struck such a heavy vein of gas as to stop further drilling. It was not difficult to discover the highly inflammable nature of the gas, and they set about devising ways and means to put it to use. Pipes were laid through the streets, and connections made with the houses. Experience soon demonstrated that, while it was but poorly adapted for light, its heating properties were undeniably good. It fell naturally into disfavour when the further fact was discovered that it was an unhealthy as well as a poor illuminant, being provocative of headache and languor; but it is still used in the street lamps. It is undeniably cheap, as the company supplying it charged but 20 cents per month per burner for its use, and 2 dols. per month per furnace or stove, with no restriction as to the amount burned. So cheap is it that the street lamps are never extinguished, but allowed to burn day and night. All efforts to regulate the flow were unsuccessful, and it was found impossible to register the amount consumed with ordinary gas-meters, and their use was long ago abandoned. The danger of its careless use has been demonstrated in East Liverpool by numerous fires, as well as by an explosion totally destroying a large brick building, and causing the loss of several lives.

The duration of life of the gas wells in this place yet remains to be decided, as those first drilled are still producing as largely as at first, or, where there is a diminution, it is caused by the filling up of the well with dirt, and the flow of gas can always be restored to its original volume by cleaning out the casing. The pressure is immense, and at night, when the gas is lighted, the flow shoots into the air a hundred feet, and its roar can be heard several miles away. Manufacturers are busily engaged in estimating the probable cost of its introduction into their establishments, and many predict that through its general adoption as a fuel the advantages of Pittsburgh as a manufacturing site will be increased a hundredfold, and that within five years it will cease to be known as the smoky city.

A New Presbytery is to be built at Alexandria from designs by Messrs. Pugin & Pugin.

### The Colonnade of Burlington House.

SIR,—In the north-west corner of Battersea Park lies prone on the earth, or rather sticking in the mud, the nearly complete structural remains of the screen, colonnade and gateway of old Burlington House, where it was placed some years since on its removal from Piccadilly. Some care seems to have been taken to place each stone in proper juxtaposition, the whole facing skyward ready for re-setting up. Well preserved generally it was, except here and there: the carvings somewhat blunted by exposure, the family ciphers and crests clean cut and bold, the interesting alternations of the rusticated columns, the massive voluted wings of the pediment, and last but not least, the lions with some other details being enclosed within some rails to corrode by themselves.

But more interesting still, the great massive door, with its huge knocker, iron fittings, hinges, all complete, were placed also apart. Here year after year have multitudes of children scrambled and gambolled over these relics, till every carved detail and projection has yielded to the constant abrasion, and now in little over a dozen years the whole is well-nigh destroyed, most certainly marred beyond hope. The ponderous doors have literally disappeared piecemeal, knocker, hinges, everything, leaving but one poor frayed fragment to tell the story. This doorway figures in Hogarth's *Man of Taste*, where Pope stands upon a scaffold whitewashing it, and bespattering the coach of the Duke of Chandos; lampooned also by Pope as Timon. One of the veritable lions is here seen. This fact is additionally interesting, as the print was afterwards suppressed. Now let me quote Leigh Hunt, in his delightful little book, "A Saunter through the West End." Says my author:—"The loss of one thing in the Burlington wall might be regretted! The gate there is worth looking at. It is the design of Pope's friend, and is no mean evidence of his eye for proportion and suitability."

Who plants like Bathurst and who builds like Boyle?

cried the poet. Boyle was the family name of the first Earls of Burlington. . . . Through this gate, besides Pope, Handel went, and Gay. The latter mentions their visits in his poem of 'Trivia'; or, Art of Walking the Streets."

Sir William Chambers, in his "Treatise on Civil Architecture," says:—"Few in this vast city suspect, I believe, that behind an old brick wall in Piccadilly there is one of the finest pieces of architecture in Europe." Walpole speaks in raptures of the colonnade, and all agreed that it was about the best example of this style introduced into England in 1617 by Inigo Jones.

Surely all this was worth preserving. Why, it would have been eagerly bought up for America to re-erect in public park or place; without over-estimating the above panegyrics, the historical interest alone should have been sufficient to rouse up some effort. The matter, I believe, was brought before Parliament during the time that Lord Henry Lennox was First Commissioner, and has been noticed in the public press without avail.

Yours obediently,

March 18, 1885.

ANDREW REID.

### The New Street from Bloomsbury to the Haymarket.

SIR,—It is not often that the Metropolitan Board of Works make a mistake in regard to any of its great undertakings, and the public is largely indebted to that useful body for the vast improvements made of late years in the Metropolis. But corporations as well as individuals are not infallible, and that there *has been* a serious error committed in connection with the new street now in the course of formation under its supervision, between Bloomsbury and the Haymarket, must be patent to the judgment of all who look at the matter either from a practical or architectural point of view.

This new street is immediately connected with the main artery from east to west, at a point where there is an enormous traffic, and instead of the approach thereto and the thoroughfare itself being in a *direct line of view* from Hart Street and Holborn, and *vice versa*, there is a most dangerous curve occasioned by the projection of the public-house at the corner of Duke Street, and a few feet of the adjoining building, which the Board has most unwisely allowed to be brought out in a line with the same.

To permit this unsightly and awkward block to remain would much disfigure the approach to the new street, whereas by taking off about ten feet from the front of the public-house, and gradually slanting the line to the western end of the adjoining building, *as it now stands*, the original plan of the Board could be carried out. True, the expense would be greater now than in the first instance; but this should be no

obstacle, considering the importance of the undertaking itself, and the public interests involved. I enclose my card, and am, sir, yours faithfully,

ARGUS.

London: March 24, 1885.

### Igneous Building Stones.

SIR,—Your correspondent on the above subject does not, as it appears to me, advance the matter. All that he proposes may be seen any day in an hour's walk round the Royal Exchange. What is necessary if there is to be an extended use of these beautiful and indestructible materials is to apply them artistically. At present, I venture to think that this treatment is almost, if not quite, wanting. They are used, after being polished, for a few details of a building otherwise entirely faced with freestone. If the freestone remained as clean as the masons leave it, this practice would not be very objectionable from an art point of view, but as it is rapidly blackened by soot absorption, the contrast of the clean and bright-coloured granite with dirty stone creates an inharmonious effect that is disagreeable in the extreme.

The remedy is easy. Abandon half measures. Face the whole of the building with ashlar of the nearly white granite from Par or Gunnislake, in Cornwall, or Okehampton, in Devon, and then execute the details in the coloured varieties—red from Peterhead or Trowlesworthy, or (with black veining) from Luxillian, emphasising the effect with a little of the beautiful green porphyry (brighter than verde antico) from Lambay Island, near Dublin, and a little black basalt from Rowley, near Birmingham. Any style but pure Classical—now obsolete—can be adopted, as the strings, jambs, and cornices can be worked out with larger and smaller splays instead of elaborate mouldings. This done, a little mosaic work in spandrels, friezes, and panels, and a façade is complete, and not only complete, but of everlasting durability, and, being polished, always clean, for being constructed of a hard non-absorbent material, every shower would wash the surface down. An eye for colour would, of course, be very desirable, but the exterior of the Duomo at Monreale (see Gravina), the campanile at Florence, the churches of the district of Aquila (Schultz) in South Italy, and our own flint and stone churches in Norfolk and Suffolk, are suggestive of appropriate treatment in these hard materials.

I am strongly of opinion that if a London façade constructed of these beautiful and imperishable materials—chaste and pure as a Greek temple, or rich in colour as a Byzantine church—were but once realised, it would be acknowledged to be the right thing in the right place, and it would probably establish a new epoch in urban architecture. No one is a greater admirer than I am of carved and moulded details in freestone, only I venture to protest that they are very unsuitable for the smoky and destructive atmosphere of London, which at once defiles and soon destroys them. Interiors and the country are the proper and sufficient fields for their display. A comparative estimate from detail drawings shows that no extra cost need be incurred. On the one hand, the usual elaborate carving and moulding of freestone is done by manual labour; on the other, a clever little machine does the surfacing at the rate of a square foot in five minutes, and polishing is done by boys.

Your obedient servant,

CEPHAS.

### LEGAL.

#### Queen's Bench.

(Before Mr. JUSTICE STEPHENS.)

BULL v. SAUNDERS—GIDDINGS v. SAUNDERS.

PAYMENT FOR QUANTITIES AND PLANS.

These were two actions relating to the same work. In the first action Messrs. J. & A. E. Bull, quantity surveyors, claimed the sum of 141*l.* 7*s.* 6*d.* for professional work done for the defendant, a London solicitor, in connection with the proposed Royal Hotel, Margate, which scheme ultimately fell through. The plaintiffs alleged that they had received their instructions from Mr. William Giddings, architect, who, they said, had received his authority from the defendant. The amount claimed included an item of 1,410*l.*, being 1½ per cent. on a sum of 94,000*l.*, the estimate for the proposed outlay, prepared by Mr. Walter Lynde, builder. The defendant denied having authorised Mr. Giddings to instruct Messrs. Bull, and contended that they did the work at their own risk—that is to say, on the chance of a company being formed.

In the action of Giddings v. Saunders, the plaintiff claimed a sum of 4,700*l.*, being 5 per cent. on the estimate of 94,000*l.*, for services rendered in connection with the same scheme as an architect. The defence was similar to the other.

In the end the jury returned a verdict for the defendant, and Mr. Justice Stephens gave judgment in accordance thereto, with costs.

## ART SCHOOLS.

**Derby.**—In consequence of the resignation of Mr. A. A. Bradbury, the committee of this school have invited Mr. Simmonds, who is at present the director and head-master of the Glasgow School of Art, to again take the position of head-master, and that gentleman has acceded to this request, and will assume the charge of the school on May 1. We understand, says the *Derby Mercury*, that the school will be completely reorganised, and that a prospectus on the new lines will shortly be issued. Mr. Simmonds will also proceed to erect a series of studios on the Burton Road on a similar principle to those in Paris, for the purpose of supplying high-class decoration work and designs for manufacturers. As a rule, all the artists employed in these studios will be either such as have completed their training in a school of art, or on passing through such a probation, the intention being to show the practical application of the system of instruction administered by the Science and Art Department to the manufacturing wants of the country. Should this scheme develop in our midst to the extent that is expected, it will afford an outlet for local talent that will be much appreciated.

## CHURCH BUILDING AND RESTORATION.

**Holywell Parish Church.**—The ancient parish church of St. James, Holywell, which has recently undergone enlargement and complete restoration at the cost of nearly 3,000*l.*, was reopened on Tuesday, when the services were attended by an immense congregation. The work of restoration on this occasion was undertaken by the vicar, the Rev. R. O. Williams, M.A., and from the plan of Mr. Matthew Wyatt, architect, of London. It consists of the erection of an apse at the church, which forms a sacarium, a quasi-chancel having previously been formed by railing off a portion of the body of the church. The organ-loft, built in the tower, has been removed, and the massive masonry in that ancient part of the church, which previously was plastered, has been brought to view. The old "loose-box" piers have been removed. The sittings in the church, which are now free and unappropriated, are of oak and pitch-pine, stained, ornamented, and varnished. The flooring of wooden blocks and the aisle are laid with pretty pattern tiles. A handsome pulpit of carved walnut has been presented by Miss Jones, Tower Garden, Holywell, and a massive brass eagle lectern by Mr. Williams, of Chester, both of which were executed by Messrs. Jones & Willis, of London and Birmingham.

**Hebden Bridge.**—The memorial-stones of the new Wesleyan Chapel were laid on Saturday last. The proposed building is to be erected on the site of the old structure, which was built in 1825. Italian will be the style, and it will be built of native stone, with facings of Yorkshire stone; the fittings will be of pitch pine and walnut. It will cost 4,000*l.*, and towards that sum 3,364*l.* has already been subscribed and promised. Messrs. C. O. Ellison & Son, Liverpool, are the architects, and Messrs. W. Ives & Sons, Shipley, are the contractors for the whole of the work.

## GENERAL.

**The Second Annual Exhibition** of the Glasgow Society of Lady Artists was opened on Monday. The collection comprises ninety-five pictures, eleven pieces of sculpture, and four plaques.

**Signor Simonetti** has obtained the commission for the statue of the late Bishop Quinn, which is to be erected in Brisbane Cathedral.

**Sir R. Loyd Lindsay** has presented a reredos to the parish church of Hagbourne. It was designed by Mr. H. Woodyear, architect.

**The King of Italy** laid the foundation-stone of the monument to Victor Emmanuel on Sunday. It will consist of an equestrian statue, with an esplanade, approached by steps from the piazza at the foot of the Capitoline Hill. The site was occupied by the convent of Ara Cœli.

**A Society of Pastel Painters** has been formed in Paris, with Mr. Roger Ballu for president, and M. Georges Petit for vice-president. Among the members are MM. Baudry, Emile Levy, Boulanger, Jules Lefebvre, Guillaume Dubufe, Philippe Rousseau, and Cazin.

**Mr. J. Usher**, of Bedford, has completed plans for the new Baptist chapel which is to be erected in Sandy.

**A Large Munich Stained Glass Window** has been erected in St. George's Cathedral, Cape Town, in memory of the Right Rev. Henry Alexander Douglas, Bishop of Bombay, who for some years prior to his appointment to that See was Dean of Cape Town. The subject represented is *The Charge to Peter*, and the artists are Messrs. Mayer & Co.

**Two Works by Ary Scheffer**, *St. Augustine and His Mother*, and a *Portrait of Mrs. Holland*, have been presented to the National Gallery.

**The Last of the Course of Lectures** at Carpenters' Hall will be delivered on Wednesday next, April 1, by Professor T. Reger Smith, on "Famous Timber Roofs." The Right Hon. the Lord Mayor, Master of the Carpenters' Company, will take the chair.

**Mr. G. S. Aitken** delivered a lecture in Dundee last week on "Ecclesiastical Architecture," from the temples of Egypt to the church of St. Isaac, Petersburg.

**M. Jean Vernaz** has discovered a large aqueduct, which formerly was used for the water supply of Carthage. It has been so well preserved that Mr. Grant, the chief engineer, proposes to employ it in connection with the new waterworks of Tunis.

**A Church** is about to be erected in Seascale from designs by Mr. C. J. Ferguson, of Carlisle.

**An Exhibition of Gas and Water Apparatus and Appliances** is to be held in Carlisle from the 13th to the 18th April.

**The Restoration** of the Church of St. Andrew, Rillington, is about to be commenced under the direction of Mr. C. Hodgson Fowler, F.S.A., Durham.

**The Primate of Hungary** has given 20,000*l.* towards the completion of the cathedral at Grau, which was commenced in 1821.

**The Report of the Ecclesiastical Commission** for last year shows that architects' fees amounted to 2,096*l.* 6*s.* 10*d.*, and the surveyors' charges to 13,651*l.* 13*s.* 8*d.*

**The Franciscan Monastery** at Upton, E., designed by Messrs. Pugin & Pugin, has just been commenced. Mr. J. Gregar, of Stratford, is the contractor.

**An Industrial School** is to be erected at Liberton, near Edinburgh.

**A New Retort-house** is to be erected at the Wortley Gas Works, belonging to the Leeds Corporation.

**Mr. A. B. Plummer** has been appointed architect for the additions to the Newcastle City Lunatic Asylum at Caxlodge, on which about 20,000*l.* will be expended.

**The Building** which is about to be erected for the Industrial Exhibition in Dublin will cost 3,300*l.* It is to be completed within ten weeks. Mr. J. J. O'Callaghan is the architect, and Messrs. Beckett the contractors.

**Mr. W. Parslow** will read a paper on "Lunatic Asylums" at the meeting of the Liverpool Architectural Society on Wednesday next.

**A Cottage Hospital** is about to be built at Watford, and at a meeting, held on the 17th inst., a site was selected, and Mr. C. P. Ayres, of Watford, was appointed architect.

**The Corporation of Southampton** have approved of a recommendation to lend the Dock Company nearly a quarter of a million of money for the construction of deep water docks.

**The Newbury Building Land Company** have purchased the meadow at Speen overlooking Northcroft, and intend laying out the property for building sites.

**The West Cumberland Iron and Steel Company**, Workington, have just received an order for 10,000 tons of steel rails for the Indian Government. The order for the rails for the Suakim-Berber railway has been divided between Messrs. Charles Cammell & Co. and the Barrow Hematite Steel Company.

**A New Railway Goods Store** has been commenced at Bolton. The contractor is Mr. Riley, of Fleetwood.

**Among the Plant** required for the Suakim and Berber Railway, Messrs. Lucas & Aird have specified a number of Norton's "Abyssinian" tube wells, with pumps and driving apparatus. Messrs. Le Grand & Sutcliffe have received orders to prepare these for immediate despatch to Suakim.

**The Geological Survey of Algeria**, long suspended, has lately been resumed, and it is hoped that a new and revised edition of the map may be ready in 1887. One, on an exceptionally large scale, of the environs of Algiers, is in course of execution, based on the map prepared by the military engineer, of the scale of  $\frac{1}{200,000}$ .

**Messrs. C. Isler & Co.**, of 88 Southwark Street, S.E., have recently completed at Messrs. Thos. Murphy & Co.'s Brewery, Clonmel, Ireland, a 6-inch bored tube well, 62 feet deep, which yields a supply of over 10,000 gallons per hour, obtained from the rocks which underlie gravel and sand beds. Mr. E. R. Southby, after analysis, reports the water "free from all forms of organic pollution. In fact, it takes rank amongst the very purest waters." Also at Messrs. Brown & Terry's Brewery, Burnham Beeches, Berks, a tube well, the same size, but 130 feet from the surface; a yield of 3,000 gallons per hour is obtained. The discrepancy is due to the nature of the strata, for in this instance the supply is drawn from the chalk beds. A 300 feet 7½-inch tube well on Bankside, Southwark, for the London and Belfast Aërated Water Company, has just been commenced.

A Business Supplement

# The Contract Reporter.

to The Architect.

LONDON, MARCH 28, 1885.

## NOTICE.

*The next Number of THE ARCHITECT will be published on Thursday, April 2, the usual day of publication being Good Friday. All advertisements intended for insertion in that Number must reach the Office not later than 5 P.M., on Wednesday, April 1.*

## LOADING TIMBER.

THE British Vice-Consul at Memel calls attention to a grievance under which timber merchants suffer at that port. With the present method of loading timber steamers are scarcely able to avoid finding that they are some sleepers short when they come to deliver their cargo. For there is an old custom that all timber should be delivered to the mate of the vessel at the timber yard, bills of lading being signed based upon his receipt. The more costly goods are transported in lighters, but for beams and sleepers this would be too expensive. They are therefore bound together in rafts and floated down the river to the ship, a distance of from one to two miles. Beams generally arrive in safety, but sleepers cannot be firmly secured, and whenever there is some wind or a strong current, the rafts get loose, and some sleepers drift away, and cannot be recovered without danger to the remainder. The clause generally contained in the charter-party, "to be delivered on board," is vitiated by the words "as customary" being added, and so masters are compelled to receive delivery at the timber yard. Merchants here insist upon this being the custom of the port, and masters have always submitted to it, partly, no doubt, because they find the arrangement not wholly without advantage, since by that means they can obtain the exact lengths and qualities which they at the moment require. If, on the other hand, merchants want to send timber to the vessel, the quantity sent would be either too great to be properly secured alongside, or too small, in which latter case the ship would have to lose time in waiting for additional cargo. To guard against being made responsible for short delivery, masters note protest, but the merchants refuse to accept a copy of a document so marked, and they object also to any remark referring to it being made on the bills of lading, insisting upon having them signed in accordance with the mate's receipt. They can force masters to give clean bills of lading by withholding their declaration of goods shipped, such declaration being required by the Custom House before they will grant clearing. Complaints have been made by steamship owners with reference to the above matter, but all the consul's efforts to procure a change have been fruitless, and he says he cannot recommend an appeal to a court of law, since he considers that the issue would be doubtful, while the expenses would be great and the object to be attained trifling.

## CONTRACTS OPEN.

**ABERDARE.**—For Supply of Cast-iron Socket and Spigot Main Pipes. Mr. Evan Jones, Gas Offices, Aberdare.

**ABERDEEN.**—April 4.—For Building Part of Steading of Offices at Wardhead. Mr. James Strachan, Milton, Lumphanan.

**AIRDRIE STATION.**—April 6.—For Iron Roof, &c. Mr. J. Strain, C.E., 154 West George Street, Glasgow.

**ANDOVER.**—For Reseating, Renovating and Painting Chapel. Mr. H. Tilling, London Street, Andover.

# R. ADAMS,

17 BLACKMAN STREET & 7 GREAT DOVER STREET, LONDON, S.E.,  
INVENTOR and PATENTEE of the  
SAFETY WINDOW WITH REVERSIBLE SASHES

FOR

## INEXPENSIVE & PERPETUAL CLEANLINESS

Which has gained at the INTERNATIONAL HEALTH and  
SANITARY EXHIBITIONS

2 Gold, 4 Silver, and 4 Bronze Medals,  
and 16 Diplomas of Merit.

The fearful sacrifice yearly of Life and Limb of persons in cleaning windows through sitting or standing outside whilst so engaged is most appalling. This can now be entirely prevented. The Patentee, having given this subject the most exhaustive study, is now prepared to supply his patent fittings suitable both for old and new windows at prices to meet the means of all. These improvements are protected by several patents, by each of which the outside of each sash can be reversed for cleaning, and under this new system that duty is rendered a pleasure, whilst the danger, risk, and tremendous responsibility of moral and statute law is removed.

These patent fittings can be procured from 5s. for each sash, and all builders have the right conferred upon them to fit the same in the purchase thereof, and that all shall have the benefit of this national boon, special Agencies are being established throughout the United Kingdom. None but practical and responsible firms are appointed. Such firms are invited to apply for unrepresented districts at once, as it is desirable to complete the list as soon as possible.

The present representatives are:—

TO THE ARCHITECTS OF THE UNITED KINGDOM.

**MR. FREDERICK HENRY SMITH, of No. 52 Queen Victoria Street, E.C.,**  
INVENTOR, PATENTEE, AND SOLE PROPRIETOR OF THE PATENT AUTOMATIC ASPIRATOR SYSTEM  
OF VENTILATION, LIGHTING, AND HEATING,

Finding it beyond his power to attend to the many applications to apply his System of Ventilation in so many different parts of the country, without increasing his Staff, has been advised by an eminent Architect to appoint Agencies in the Counties of the United Kingdom, whose duty it will be to prepare Plans, Specifications, and Estimates, and to superintend all works where the Syphonic Aspirator System may be applied.

For further particulars, terms, &c., &c., apply in the first instance, by letter only, at the address of the Patentee above given.

Cream, Fumigators, &c., &c.

AS SUPPLIED TO 600 PUBLIC HEALTH  
BODIES.

The Sanitas Co., Limited, Bethnal Green E.

GRUNDY'S PATENT  
WARM-AIR  
VENTILATING FIRE GRATE.

The novelty, superiority, and advantage of this patent consist in the heating surface being greater than any other Fire-grate introduced to the public. It is very simple in construction, and is made in the form of a Stove, the back of which is semicircular in shape, with gills behind and smoke-nozzle on top, all cast in one piece. The same can be attached to any design of a Register or Stove front. It is very suitable for schools, class-rooms, waiting-rooms, hospitals, offices, dormitories, and dwelling-houses, from the cottage to the mansion. Design and specification post free on application.

## TESTIMONIALS.

"9 Victoria Chambers, Westminster, S.W.

"June 10, 1884.

"Sir,—I have much pleasure in testifying to the efficiency of your patent Warm-Air Fire Grate. It has been very successful, and given every satisfaction where I have used it.

Yours, &c.

"To Mr. Grundy. JAMES WEIR, F.R.I.B.A."

"Baptist Chapel, Clapham Common, London. Richard Webb, Pastor, 10 Grafton Square.

"February 15, 1884.

"DEAR MR. GRUNDY,—I have pleasure in testifying to the excellency and efficiency of your patent Fire-Grate. It is the most charming invention for heating a large room I have ever known. I shall have pleasure in showing it to anyone who wish to have their schools or rooms pleasantly and efficiently heated."

From James Garry, Esq., Architect, West Hartlepool,  
July 1884.

"DEAR SIR,—I have very great pleasure in stating that the first stove, or patent warm-air ventilating fire grate, adopted by me in school at Seaton, and a second in a Cocoa Palace, have given such satisfaction that I now order eleven to be inserted in New Upper Grade Schools in course of erection at West Hartlepool. They are the most economical, efficient, and easily managed stove at present before the public.

"Mr. John Grundy."

From Hon. and Rev. G. G. C. Talbot, M.A., Withington, Cheltenham.

"DEAR SIR,—You will be gratified to hear that the school is completely warmed by your new grate. It is the most economical and efficient that I have ever seen.

"Mr. John Grundy."

From F. J. Yates, Esq., Architect, Birmingham.

"The best of the kind I have seen. I shall have pleasure in securing their adoption whenever opportunity offers."

Apply to JOHN GRUNDY, 30 Duncan Terrace, City

Road, London.  
Works—TYLDESLEY, near MANCHESTER.

# THE "HARDING" VENTILATING COMPANY,

30 EAST PARADE, LEEDS.

## HARDINGS' PATENT AIR DIFFUSER

FOR VENTILATING ALL KINDS OF BUILDINGS.

Diffuser with Filter.

Mr. T. PRIDGIN TEALE, F.R.C.S., M.A., Surgeon to the General Infirmary at Leeds, says of Hardings' Diffuser in his book called "Dangers to Health":—"I am satisfied that by means of this apparatus, we can secure in a town freshness of atmosphere, absence of draught, and exclusion of dirt."

The fresh air is conducted through a grate and aperture in the wall, as shown on section, about 7 feet 6 inches above the floor level; it is then conveyed through the filter, and passed into the room through a series of small tubes placed at an angle of about 30 deg. with the wall.

By these means the currents of air rushing into the apartment are compressed whilst passing through the tubes. The currents of air, as soon as liberated, expand, cut into, and break each other up, and diffuse in all directions so effectually that no draught or chilly sensation can possibly be experienced by the occupants, and at the same time a large volume of pure air is constantly being admitted and dispensed evenly through the apartments.

SECTION

WALL.

**CHURCH WALL VENTILATOR.**—As used in the ventilation of Archbishop Zouche's Chapel, York Minster.

The DEAN OF YORK, with reference to the ventilating of Archbishop Zouche's Chapel at York Minster, says:—"I think the ventilation is perfectly successful, and all I have spoken to about it are well satisfied with it, and much pleased with the result."

**OUR PATENT EXTRACTOR** is the best in the Market, and is supplied at a very much lower price than any other.

**CHURCH WINDOW VENTILATOR.**—These Ventilators are used for Churches, Chapels, and other Public Buildings where it is not desirable to have holes cut through the walls to admit air in the usual manner. The appearance is not more noticeable than the ordinary Hopper Ventilator so frequently seen.

Air Extractor.

"Armley, Leeds, Oct. 29, 1883.

"GENTLEMEN,—I have pleasure in stating that in my opinion your system of ventilation, introduced in our Church this summer, is a decided success. Heretofore when the Church has been well filled at the Evening Service, I have been almost exhausted by the effort of speaking before I have got half through. On Sunday night, October 7, at our Harvest Thanksgiving, we had a very large congregation, and I preached without the least feeling of weariness or exhaustion. I shall be glad to hear that your Air Diffusers are being widely adopted.—I am, yours truly, JOHN GREGORY, Minister of Oak Road Congregational Church, Leeds."

These Ventilators are more suitable for Schools, Warehouses, and other Buildings where cheapness is an object. The result is precisely the same as in our other styles, at a very much smaller cost.

A reduction in price is made where a number of Diffusers is required. Estimates and further information given on application to the "HARDING" VENTILATING CO., 30 East Parade, Leeds.

## VOLUME XXXII. OF THE ARCHITECT.

Handsomely bound in Cloth, Gilt Lettered. Price 12s. 6d.—Office: 175 Strand, London, W.C.

enamelled iron and earthenware. Garden and fire-hose, speaking tubes, with whistles and mouthpieces may also be seen. Among the specialities shown are valve-closets—"Simplex," "Grosvenor," and "Argosy;" patent wash-out closets, and "National," "Alliance," and "Crown" closets. The cabinet-work shown in connection with lavatories and closets is on a par with the reputation of this firm for the excellence of their articles. We are able to call attention to a lavatory with a double-action valve, now exhibited for

the first time. It has great merits which deserve special recognition, and if we mistake not it is likely to become a favourite in clubs, hotels, restaurants, better class houses, &c. Often a minute of time saved means the saving of half an hour or more. You wash, say, in a

lavatory fitted with these new specialities of Messrs. Bolding. It is perfectly clean, no dirty or soapy remnants whatever, though someone has only just left it. The next comer simply pulls out a handle, and washes straightway, and pushes back again the handle as he takes the towel. All is then clean and ready for the next user. To speak more accurately, when the handle is pulled out it locks with a quarter turn, the basin fills itself, and the water stops flowing automatically when the basin is full. The basin has a perforated flushing rim through which the water fills the basin. When the handle is released, the waste water escapes, and the valve is opened, which gives a flush that thoroughly cleanses the basin. The perfection of the invention for lavatory purposes will thus be seen. This self-cleansing principle, so to speak, is also shown in its application to closets, and here the main principle may be said to consist in this, that no matter how long you hold up the pull, there is always an after-flush on releasing it. Also are shown McGill's patent urinals, and Bolding's automatic cistern. There is no metal used in

"SIMPLEX"

the construction to get corroded. Unlike any other urinals, they are made of glazed stoneware. The facings are of enamelled slate. They are always clean and practically indestructible. They are flushed automatically, the flush being timed for every half hour. Bolding's Patent "Bottle" Traps are much in request, which proves the excellence and efficiency of a

speciality which was first brought before the public at the Health Exhibition. It is particularly suitable for kitchen and butler's pantry

sinks, the special point being that the escape of sewer gas is prevented, it being impossible to break the seal by syphonage. The dip is made to remove at will, so that it can be unstopped without any trouble, and a cup catches and prevents foreign matter passing into the pipes.

"SYPHON" WATER WASTE PREVENTER

Also are shown most effective apparatus in water-waste preventers, single and double, and also the capital automatic syphon water-waste preventer. The cabinet-work shown has been

Castings of all Descriptions.  
GUY & STEVENS, Ceres Iron Works, Kingston-on-Thames.

alluded to, but mention should be made of a portable closet, a most handsome piece of furniture, in the shape of an elaborately-carved chair richly upholstered. Notwithstanding the entirely practical contents of this exhibit, all the articles, from the largest to the smallest and most ordinary objects, are so beautifully finished off that the stand has a most attractive appearance.

#### Lincrusta-Walton.

Messrs. F. WALTON & Co., of Sunbury-on-Thames, have a handsome pavilion constructed to illustrate the artistic effect which can be attained by the use of their Lincrusta-Walton, or Sunbury wall decoration. It contains a dining-room, the decorations of which, of a pale green colour, are designed with a view to acting as a set-off to the other appointments of such a room, and the filling, while rich and handsome in itself, would form an admirable background to pictures. The dado is a successful attempt to produce an effect equal to carved wood dado, in harmony with the general scheme of the decoration. The picture rail is a much more decorative feature than an ordinary picture rod, while it is essentially quite as useful. The door panel decoration is especially worthy of notice, as it is a new design arranged for the purpose of fitting panels from 5½ to 12 inches in width, and of any length, and allowing of each panel being a complete and artistic decoration. The hall is treated in warm, reddish colouring, intended to act as a decorative contrast to the dining-room, the lower part being an excellent pattern, fully producing the effect of leather both in its relief and treatment. Another decoration in old gold, with leather coloured ground, is a new and beautiful design, Renaissance in character, and the treatment is after the style of old leathers. Several capital examples of machine decoration are the first efforts in a new departure, and are likely to prove of value to the trade as well as to the general public. Most of the patterns in the exhibit are new this season. The furniture in the dining-room is by Messrs. Edwards & Co., 8 Soho Square, who turn out good work as makers of cabinet-fittings, mouldings, &c.

#### Stone Bros.

Messrs. STONE BROS., Bath Stone Office, Bath, show samples of the Bath stone from their quarries. The varieties shown are Combe Down, a material that differs considerably in quality according to locality, that from the Lodge Stile Quarries being a thorough good weather stone, and can be used with safety at any season of the year for any building purposes, however exposed the situation may be. It is of a light colour, free from soft yellow beds. Box Ground, a good weather stone, of a warm colour, sound, and in blocks of any required length. Stoke Ground, regular in texture, sound, and free from soft beds and hard veins. Used externally as a weather stone, as well as for inside dressings. Farleigh Down, a soft and very fine quality, cheaper in working than any other kind of Bath stone, and of a rich yellow tinge, in two varieties, brown or red bed. It is recommended for all external works except plinths, string courses, copings, &c. The white bed is well suited for tracery and internal purposes. The beds vary in depth from 10 inches to 3 feet 6 inches. Corsham Down, which is of fine texture, sound, and works well for carvings, mouldings, and tracery, but should not be employed for exposed purposes. Also Westwood Ground, &c.

#### Young & Co.

Messrs. FREDERICK YOUNG & Co., Clerkenwell Green, show sample cases for telegraph instruments, telephones, electric bells, &c., made by their American dovetailing machines. Several firms in the cabinet trade have given large contracts to these gentlemen for executing dovetailing, the system being both economical and exceedingly neat.

#### Roger L. Lowe.

Mr. R. L. LOWE, Britannia Works, Farnworth, near Bolton, shows samples of his improved wood-block flooring. This flooring has been found a most excellent system wherever durability, noiselessness, perfection of workmanship, smoothness of surface, freedom from splintering, cracking, working loose, &c., is desired, and

not only can stand, but has stood the test of continual and heavy traffic passing over it. This result is obtained by use of the best materials, and by adopting the most perfect system of laying, besides which, a patent preservative composition plays also an important part in the work. It is this glue-like composition which permanently fastens the wood-blocks to the concrete, while nothing short of destroying a block will detach it after once it is placed in the composition. The composition has this further advantage, that it forms as it were a sort of cushion for the wood-floor, a result all in favour of the durability of the wood-blocks, owing to a slight elasticity imparted instead of absolute rigidity. The usual way of laying wood-flooring is to bed the seasoned blocks on concrete in wet mortar cement. Where you employ seasoned wood it is against common sense to bed it in concrete while wet. The seasoned blocks swell, and then again rise under heat, which produces disintegration of the floor. Mr. Lowe carefully avoids this. They are laid on a carefully-prepared concrete floor, thoroughly dry, fitted together to insure perfect accuracy of adjustment, and then each block is dipped in the liquid composition while hot, and laid into position at once, and so a beautiful solid floor is obtained. The work has proved itself; but, in addition, Mr. Lowe is quite prepared to guarantee it.

#### Maw & Co.

Messrs. MAW & Co., Benthall Works, Jackfield, near Ironbridge, Shropshire, display their pleasing pavement tiles in many varieties all excellently designed. A beautiful reredos arrangement shown at the exhibition at the Floral Hall is to be seen here again. It is of decorative majolica and mosaic, with combined enrichments carefully harmonised. Specimens of plain, encaustic, patent, and Florentine mosaic, incised and intaglio pavement tiles are shown, and there are plain, glazed, and decorated, enamelled, embossed, and painted tiles for walls, fireplaces, hearths, &c. The name of the firm is sufficient guarantee of the excellence of their wares.

## STEEL CUT NAILS!!

The modern and important discovery in the process of making Steel has so reduced the price, that Steel Cut Nails of the well-known "Mitre Brand" can now be supplied at only 1s. 6d. per cwt. more than the price of the ordinary Common Iron Cut Nails.

The Steel Cut Nails are far superior in quality and more uniform in size than any wrought or hand-made Nails yet produced, and being lighter in weight than ordinary Iron Cut Nails and free from wasters, they are found cheaper in actual use than common Iron Cut Nails at 1s. 6d. per cwt. less.

These Steel Cut Nails are specially suited for Builders, Joiners, Coopers, Packing-Case Makers, &c., and a single trial is sufficient to convince any one of their superior quality and cheapness.

## READING CASES FOR THE ARCHITECT.

Price Two Shillings.—Office: 175 Strand, London, W.C

*G. Middleton Edwards.*

A model of a section of the outer wall of a two-storey house is shown by Mr. G. M. EDWARDS, of 54 Gresham Street, to illustrate the application of his patent iron laths, which will be found of great utility in the construction of fireproof walls, partitions, ceilings, &c. Mr. Edwards also shows his patented corrugated iron sheets for use in combination with concrete for fireproof floors, &c.

*H. Thompson & Co.*

Two small sections of brick wall, exhibited by Messrs. THOMPSON & Co., of 95 Marrow Street, S.E., serve admirably to show the damp-proof character of their patent oxide paint, with which one of the specimens is coated, while the other is papered, and both are exposed to the action of water. Messrs. Thompson have also on view some enamel paints and stains for wood.

*William Edgumbe Rendle & Co.*

Messrs. WILLIAM EDGUMBE RENDLE & Co., 3 Westminster Chambers, Victoria Street, S.W., show the well-known Rendle's patent systems of glass roofing for railway stations, markets, workshops, weaving sheds, skylights, exhibition buildings, conservatories, plant houses, orchid houses, &c., the special advantages of which are a great saving in cost of maintenance and repairs, no breakage from contraction or expansion from heat or frost, that squares of glass can instantly be replaced, that construction is strong and durable, and the glass put on in one-fourth the time of the old plan, no drip from condensation, and all woodwork is covered and sheltered from the weather by the glass. Rendle's patent "acome" glazing is used solely by the Government at the Woolwich Arsenal and Dockyard for the last seven years. The long list of works executed by the firm would fill pages. No better testimonial of the excellence of this system of glazing without putty, &c., could be wished for. Some of the largest and most important roofs in the country are among the works completed. Seven million

square feet of the patented system have been already fitted in Great Britain, the largest area being the new Citadel Station, Carlisle, containing 350,000 feet super.

*Eck, Callow & Co.*

Messrs. ECK, CALLOW & Co., of 10 and 11 Dean Street, Holborn, exhibit their application of electricity to the ringing of church bells, by which one person can ring any number of bells, of any size, without fatigue, and by a simple arrangement of keys. Brown's patent electric fire alarm keeps itself always under test, and gives an immediate warning on the slightest outbreak of fire in any part of the building where it is applied. The new form of pendulum indicators for electric bells requires no readjustment by hand after ringing, and continues to indicate for five minutes after the bell has rung. Harrison's burglar alarm gives instant notice of intrusion on the premises. Artistic pushes, in metal, terra-cotta, Doulton ware, &c. Portable bell-sets for invalids and travellers. A very clever and economic deodoriser and disinfectant for water-closet cisterns, which is perfectly automatic, and can be applied to any flushing cistern in two minutes, is also applicable, charged with other chemical material, for use in ordinary cisterns, to soften and purify the water for domestic use.

*Indestructible Paint Company.*

THE INDESTRUCTIBLE PAINT COMPANY, Limited, 27 Cannon Street, E.C., occupy a prominent position in the hall, where they show the various preservative paints and preservative solution, with samples and models to show the application and portions of material, to show how effectual the use of the paints, &c., has proved. A gold medal (highest award) at the Health Exhibition, and diploma of honour (highest award) at the Fisheries Exhibition, were conferred on the Company for Browning's permanent preserving solution and paints. The preservative solution has been used with success for withstanding action of the atmosphere, and

preserving and rendering weatherproof stone, marble, cement, brick, &c. The preservative paints for all kinds of purposes, including painting and decoration for hospitals, asylums, schools, houses, for iron structures, and painting ships, have given satisfaction wherever used. Every possible shade is provided to meet individual tastes or requirements, and the paint has proved its efficacy under all sorts of trying circumstances—weather, damp, &c. Any one can form a good idea of the efficacy of the solutions and paints by looking at the samples and models shown. In the case of damp having rotted the plaster of a wall, a large piece shelled off and came down, and shows material held together where treated with the paint, the paint showing a beautiful gloss, as when first put on. Samples of painted iron, as used on the telegraph ships, and other iron ships, with testimonials from Captain Richardson. The paint is used on the iron roofs of the Houses of Parliament. Plaster casts, friable bones, fossils, &c., at South Kensington, are preserved by the solution. Capital fossil specimens, sponges, corals, &c., may be seen at the stand thus preserved; the specimens were taken from Kent out of the chalk. For models, casts, &c., it has also been used at art schools in Manchester, Blackburn, Dover, and Croydon, and at the Manchester Grammar School. We cannot now do more than refer readers to lists, showing where the productions of the Company have been used, and to the testimonials of the firm.

*Henry Smyth.*

Mr. HENRY SMYTH, Ekman's Wharf, 33 Wharf Road, City Road, N., sole agent for the United Kingdom for Ekman's Mechanical Joinery Company (Limited), of Stockholm, shows a collection of Stockholm-made yellow doors, mouldings, architraves, skirtings, and trellis-work, Swedish school desks, sashes, and frames—all of the best quality of well-seasoned Baltic yellow. The workmanship is certainly excellent, and it is most convenient to have access to such goods when required at short notice. The expanding trellis-work is a most useful article for many purposes.

LONDON.

Works: EGHAM.

*Guy & Stevens.*

Messrs. GUY & STEVENS, Ceres Ironworks, Kingston-on-Thames, show excellent and substantial work. At their stand are to be seen specimens of cast-iron manhole frames and covers with wood blocks, ventilators, &c.; gully grates and castings of every description. The improved builders' screens should be noticed as most durable articles, especially in heavy work such as screening gravel. The improvement consists that instead of fixing the wires to the cross bars by wire, the wires pass through holes punched in the cross bars. The cross bars are of stout hoop iron rivetted into a strong iron frame. They are punched by machinery with holes the exact size of the wires, and at correct distances apart. Through these holes the wires, which are very stout, are driven and compressed, thus making an almost indestructible screen, and the wood frames are very strong.

*Moule's Patent Earth-Closet Company (Limited).*

This company exhibit specimens of the earth-closets and apparatus typical of the system, and manufactured in varieties suitable for any position or requirement, or any building or part of a building. The earth principle is the only perfect one. This is a commonplace fact, and no figure of speech. In the next place the principle has been reduced to practice, and is now utilised by skilfully devised apparatus, simple and convenient in working. A beautifully made model exhibited shows the application of a block or series of the earth-closets to school purposes. Two parallel rows of closets, back to back, with central gangway between, giving access for the removal of receptacles and filling in of earth, are built in a yard enclosed by brick walls. Access to the closets is gained from the playgrounds. Boys' and girls' playgrounds being separated by a party wall, the school children can only get access to their respective block, and besides are otherwise entirely shut off from access to the yard. The main part of the yard is entered from outside. Two large gateways admit carts, &c. There is a furnace, with plate for drying earth, and gateways

can be opened and the louver boards removed from the louver windows in wall near furnace to admit air and sunshine more freely. Besides removing the receptacles by means of the central gangway at back of the closets, a very simple arrangement for supplying earth is by means of a long continuous trough, which feeds all the apparatus, however many they may be. The block of closets shows a gabled roof, with lantern light running the length at top, the sides of lantern having louver boards for ventilation. The closets are used extensively, and in every way they have been found to be most satisfactory. They are in use

among other places at the Sutton (Surrey) Board Schools, St. Mary's Orphanage, Hounslow, and at the Charterhouse Schools, Godalming, schools and masters' houses throughout being fitted with them. During the last sixteen years there have been 150 closets at the Wimbledon camp, besides urinals, commodes, &c., for camp hospitals. The company have carried out many contracts for the Government at home and in the colonies. Also they have supplied the depot for the Suakim and Berber Railway, and also the camps and hospitals; also the Eastern Telegraph Company, &c. Among the many prizes awarded to the system, a certificate of the first class was awarded to a new patent earth-closet (No. 9)—a "pull-up"—at the Medical and Sanitary Exhibition. It shows only an earthenware basin or rim, with a layer of clean earth resting

on a valve that serves to conceal the receptacle beneath it. When the handle in the seat is raised the soil on the valve is upset into the receptacle, and on the handle being let down

again a fresh layer of earth is discharged on to the valve. This apparatus is made in teak and mahogany, and sent out ready fixed for placing in position. The gold medal, it will be remembered, was awarded at the Health Exhibition for the earth-closets, as being most effective. The system, indeed, cannot be too highly recommended, and it is a pleasure to note that the firm have been kept as busy as possible all the winter.

*George Porter.*

Mr. GEO. PORTER, of 23 Cullum Street, shows his system of electric and pneumatic bells. The latter, as is suggested by the name, are worked by a current of air which passes from the push to the indicator, through the medium of a very small tube. Both the push and the indicator are fitted with metal cylinders and pistons.

*Ewart & Son.*

Messrs. EWART & SON, 346 Euston Road, N.W., occupy a central position in the hall, and their exhibit has proved most attractive. Conspicuous in the middle of the stand is a trophy of ornamental zinc surmounted with an embossed copper finial, an apt illustration of what can be done in this direction, when good design and high workmanship are brought into play. On the floor is a show of baths, in various forms, with sprays, waves, douches, showers,

# INTERNATIONAL HEALTH EXHIBITION: GOLD MEDAL AWARDED. REDUCTION IN PRICE.

A REDUCTION OF OVER 25 PER CENT. IN THE PRICE.

WILLIAM WHITE,

Head Office and Works:—BELMONT ROAD, ABERGAVENNY.

A brick on flat and one on edge wall, suitable for Cottages, or where great economy is required. It is quite damp-proof and equal in strength to a 14-inch wall built with mortar only.

A wall built two half bricks on the flat is much stronger than an 18-inch wall built in the ordinary way.

# DAMP WALLS.

## BLUNDELL'S PETRIFYING LIQUID

Is a preparation for interior use, for the cure of DAMP WALLS. It is made in two colours, White and Red. It is applied with a brush as easily as ordinary paint, and dries hard in a few hours with a glazed surface. The many uses of such an article are obvious. As an economical substitute for White and Red Glazed Bricks, for interior walls, it is most efficient. Applied over brick, cement, iron, or wood, for the walls of passages, kitchens, schoolrooms, hospitals, and charitable institutions, where CLEANLINESS is indispensable, it will be found invaluable, as the smooth enamelled surface offers but little hold for dirt, &c., and can be washed when necessary. Used over walls before papering, it prevents discolouration, and offers a surface to which the paper will adhere firmly. Economical in cost, simple in application, and efficient in use. The proprietors recommend it with full confidence. To be obtained of the leading Paint Colour, and Varnish Dealers.

BLUNDELL, SPENCE & COMPANY, LIMITED,

Colour, Paint, and Varnish Makers, Oil Boilers and Refiners,  
HULL, and ANCHOR WHARF, 9 UPPER THAMES STREET, LONDON, E.C.

# VOLUME XXXII. OF THE ARCHITECT.

HANDSOMELY BOUND IN CLOTH, GILT LETTERED.

Price 12s. 6d.

OFFICE: 175 STRAND, LONDON, W.C.

&c., with gas boilers for providing hot water. The baths should be inspected. They are shown with boiler combined, as also others without. A capital zinc bath with brass fittings is specially constructed of extra thickness, and thus rendered a thoroughly durable and lasting article, notwithstanding its inexpensiveness. Elaborately got up baths are cased in polished mahogany, walnut, or other woods, with silver-plated mountings. Besides the bath with hood having spray, shower, wave, douche, &c., and boiler by side forcing water to top, is a bath similar in every respect, but without hood. This is most useful where circumstances would not permit of placing a hooded bath. It is a luxurious bath, where the bather sits at his ease in his bath, and at will is played on by wave, spray, or any other of the pleasant modes devised for showering water on him. In another part of the Hall are stamped zinc friezes, ornaments, building enrichments, and also fine ornamental zinc dormers and cornice. In addition to the above are shown specimens of window conservatories, and a selection of ornamental tiles for flower boxes. One special exhibit is the "Empress" ventilator—an old and tried friend—now made in hardened copper, instead of japanned iron as formerly.

*Frederick Henry Smith.*

Mr. FREDERICK HENRY SMITH is the inventor, patentee, and sole manufacturer of Smith's patent automatic siphonic aspirator system of ventilation, lighting, and heating, the patent being designed to solve the problem how to create ventilation without draught. Mr. Smith's stand is intended to notify the existence of the system, and more especially to invite visitors to inspect personally the system at the test-room, at 52 Queen Victoria Street, E.C., as it would be impossible to show it at the hall, except in a fragmentary way. We hope our readers will take advantage to make a visit of inspection to Queen Victoria Street.

The most sceptical will be convinced that Mr. Smith has succeeded in solving the problem of ventilation without draught by a visit to his test-room. As to construction, the aspirator or

metal lungs—a by no means inappropriate term—may be made in any metal or other suitable material. It consists of three circular plates of nearly equal dimensions. The top plate, or disc, has a circular opening in the centre of the diameter required for an outlet pipe to pass through it, utilised for carrying off vitiated air from the room or building in which it may be placed. This outlet pipe forms the neck of the second plate or disc; the flat plate from which it is carried is perforated, the diameter of the holes being determined by the size of the aspirator used, and the same are placed near the outer edge of the flat plate. This outlet or neck curves gradually up from its base before it is carried through the circular opening of the top cover before mentioned. The third plate or disc, which is also the base of the aspirator, is slightly larger, and the two other plates drop into it and are thus held in position. To provide for the air-way between the three circular plates being properly maintained, small iron tubes are provided, which keep the plates equidistant one from the other. To deflect the heated or vitiated air into the aspirator the outer edge of the bottom plate is inclined slightly upward. From the top cover is carried a smaller pipe, somewhat less in diameter than the "outlet pipe," which is the inlet or inspiring pipe for conveying fresh air into the air chamber between the top cover and perforated plate or second disc. The air thus conveyed into the top air chamber filters through the perforations into the lower chamber, and, thus split up, escapes through the annular space formed by the depth maintained between the second and third plates. The opening in the middle plate slightly sails over the bottom disc with a nicely graduated curve, so that air passing through the annular space creeps, as it were, up and around the sides of the outlet pipe, and by capillary attraction or air-suction levers, so to speak, the hot and vitiated air from the room below into this aerial weir, which once having passed into it, is rapidly dispersed and carried off into the outer air. This aspirator is adaptable for all kinds of buildings with one or many floors. Another aspirator shows a different

arrangement for introducing fresh air into the air chambers, an arrangement which is considered by some scientific authorities as an improvement upon that with the inlet tube for a like purpose. Its use would, however, be restricted to buildings of one chamber, whose roofs communicate direct with the outer air; and would not be available where there are a series of floors one above the other. The improvement consists in a modification of the arrangement of the top or outer cover, which has a circular opening in its centre, and so cut away as to admit of an annular space between it and the neck of the second disc, after passing through it. This annular space round the neck of the second plate acts as an inlet for fresh air, which passes down all round the intervening space between the top cover opening and the neck of second plate into the air chamber between the outer cover and perforated plate. In practice this should answer excellently well, and will obviate draught or blast of any kind. This form of inlet the patentee calls the "jacketed inlet;" as another advantage it renders unnecessary a second inlet tube. The air spaces between the discs and the due connection of the several parts with each other have been scientifically and mathematically worked out. Too often, ventilating systems display a total disregard of natural laws, which insures failure, and Mr. Smith's success must be largely attributed to his recognition of this fact. Next week we purpose giving a description of the application of the system to buildings.

*Harry Hunt.*

The collection of stoves exhibited by Mr. HARRY HUNT, of Newington Green, contains some of very pleasing and artistic design, among which the most notable are "The Hygiene," which is intended for entrance halls and similar positions, and which possesses the advantage, in addition to its good external appearance, of requiring feeding only once in thirty-six hours. "The Crown Jewel" and "The Victoria." Mr. Hunt has also a patent kitchener and patent regulating grate, &c.

# THE GREAT PROBLEM OF THE XIX<sup>TH</sup> CENTURY. VENTILATION WITHOUT DRAUGHT.

The hitherto unsolved problem of "Ventilation Without Draught" is to be seen practically illustrated at FREDERICK HENRY SMITH'S Test Room, No. 68, 52 Queen Victoria Street, E.C., Patentee of the Automatic Siphonic Aspirator system of Ventilation. A personal inspection invited.

*Extract from the Annual Report of the "French Hospital and Dispensary," issued 29th January, 1885.*

We have also to return our best thanks to Mr. Smith, who undertook gratuitously to repaint one of our wards and to apply a new system of ventilation of his own invention, which was very successful.

*Letter from David Urquhart, Assistant Engineer to Colonel Sir Francis Bolton, C.E.*

F. H. SMITH, ESQ., 52 QUEEN VICTORIA STREET, E.C.

4 THE SANCTUARY, S.W., LONDON: NOVEMBER 22nd, 1884.

In reply to your inquiry, I have much pleasure in certifying that your system of ventilation as applied to the "Island Room" of the luminated fountains at the Health Exhibition reduced the temperature during the displays from about 110 deg. to about 70 deg., and thus enabled the men to perform their duties without inconvenience.—Yours faithfully,

DAVID URQUHART.

*Extract from the TIMES of March 14, 1885, page 7.*

"VENTILATION WITHOUT DRAUGHT.—This desideratum appears to be accomplished by a syphonic system devised by Mr. Frederick H. Smith, at whose offices, 52 Queen Victoria Street, London, we recently inspected the arrangement. The air supply is conducted into the apartment from the external atmosphere by means of air ducts, which terminate in distributing passages at the floor level. The exit for the vitiated air is placed in the ceiling, and consists of two tubes, a large and a small one, running parallel to each other between the floor joists in the case of rooms having others over them. In the case of rooms on top floors, or those having the roof directly over the ceiling, the tubes are placed concentrically, but the action and results are the same. The larger of the two tubes carries off the vitiated air, while the smaller one forms an induction tube for cold air, its outer extremity being open to the atmosphere. These two tubes or conduits are so connected that the passage of the heated air through the larger tube induces a current of cold air through the smaller one in a continuous stream. The result is a rapid clearing away of all deleterious gases and products of combustion as they accumulate, and the preservation of a pure atmosphere at an equable temperature in the apartment. In a small room at Mr. Smith's offices in which five large gas-jets were burning, the atmosphere was apparently quite noxious at the level of about 7 feet, the temperature being about 60 deg. Fabr. At a higher level, however, and especially near to the ceiling, the temperature was high and the air greatly vitiated. It was demonstrated that this vitiated air was being drawn off through the exit tube, which acted as a powerful sucker. After turning off the gas-burners, and upon the temperature of the room generally becoming lowered and equalised, a feeble upward action was still maintained in the upcast tube, but there was no down-draught whatever. The system has already been applied to a church and other buildings with acknowledged success."

*Harding Ventilating Company.*

The HARDING VENTILATING COMPANY, 30 East Parade, Leeds, here exhibit their scientific method of ventilating buildings without draught for the first time in the South of England. The present is indeed only the second time the company have exhibited, the first occasion being at the Building Exhibition in Leeds. As the firm do a large business in the North of England, they have been well advised in showing to the public in this part of the country what they can do, and it must be conceded that they have devised an economical system of ventilation, which must prove effectual in excluding draught and dirt while admitting fresh air. The principle is to conduct fresh air into the room or building to be ventilated through a grate or aperture in the wall, thence conveying it through a filter, whence it is passed into the room through a series of small tubes placed at an angle of 30 degrees with the wall. The currents of air are compressed while passing through the tubes, and on their escape they expand and break each other up, and thus diffuse a large volume of fresh air evenly and without draught. The apparatus, as seen within

the room, takes an ornamental form if required, so as to be in perfect harmony with room decorations, &c. The engraving shown represents one

designed for churches. They are much used in the north for all sorts of buildings, and in a plain style they are used for ventilating mill works. The filtering medium is silk gauze, running zigzag fashion backwards and forwards through

the grating, instead of merely a facing of gauze over the aperture. If the aperture be 8 inches, instead of 8 inches of filtering gauze there are several feet. Harding's patent air-extractor,

used in connection, where the room has no outlet by flue from fireplace or the like, consists of two perforated cones and a central tube, the

small inner cone being simply to prevent the rain from getting into the tube. The external air impinging upon the perforated cones is deflected, creating an induced current up the vertical tube, drawing the foul air from the interior of the room, and expelling it through the perforations. The extractors are designed so that they can be placed inside an ornamental turret, the action of the extractor being in no way affected by so doing. A window diffuser is also shown, which is very suitable for churches, schools, &c., and obviates the necessity of cutting through walls, being useful also for buildings where plenty of fresh air is wanted. The window is like a hold-up window reversed, the small inlet tubes being through glass instead of through wood cases, as in the other diffusers.

*Muldoon Bros.*

Messrs. MULDOON BROS.' exhibit consist of models of road pavement, wood block paving, herring-bone bricks for paving churches &c., Seyssel asphalt, British asphalt, damp course, bricks, &c., marble and enamelled slate chimneypieces in various styles, fenders, tablets &c., &c.

*P. A. Maignen.*

Mr. MAIGNEN shows his patent "Filtration rapide" as applied to households, factories, and waterworks, and as supplied to the Nile and Suakim expeditions. Also the patent water softening process. The object sought for in making this filter was to produce an article which would turn out perfectly pure water. This was to be accomplished by introducing a material that could communicate any offensive or injurious quality to the water, by securing the removal from the water in the filtering process of all suspended matter, even to the smallest bacterium or bacillum, as also organic and inorganic matters in solution, such as iron or lead among the latter, and by aeration of the water during filtration. Lastly, to produce an apparatus so constructed that the purchaser can himself take it entirely to pieces, throw away the old filtering materials, and replace it by fresh with little trouble and at slight cost.

The ONLY MEDAL for Tiles at the INTERNATIONAL HEALTH EXHIBITION, 1884,  
WAS AWARDED TO

**H. J. & C. MAJOR,**

Late SEALY. Established upwards of 200 Years.

**THE PATENT TILE WORKS,  
BRIDGWATER.**

Sole Manufacturers of Non-Porous ROOFING TILES, of various patterns, having C. Major's Patented Improvements, which, forming a double "rabbet" at the top, bottom, and sides of the Tiles, and avoiding cut or unprotected corners, make a secure lap that PREVENTS "WIND-STRIPPING" and ENTIRELY EXCLUDES DRIFTING RAIN AND SNOW.

Manufacturers of the Imperial Bath Scouring Bricks, Patent and other Roofing Tiles, Bakers' Oven Tiles, &c., &c.

GALVANIZED CORRUGATED PITCHED  
ROOF

**IRON ROOFING.**

HAY SHEDS, BUILDINGS, CHURCHES, SCHOOLS, MISSION ROOMS.

**GALVANISED IRON SHEETS.**

Felt Tanks, Fencing, Eaves, Gutters, Down Spouts, Nails, &c.

**E. F. BLAKELEY & CO,**  
25 Hatton Garden, Liverpool.

VOLUME XXXII. OF THE ARCHITECT,  
handsomely bound in cloth, gilt lettered.

Price 12s. 6d.

Office: 175 Strand, London, W.C.

**ROLLED MALLEABLE IRON JOISTS AND GIRDERS,**

Of various sizes up to 20 inches deep, with top and bottom Flanges in usual proportion. Also all other descriptions of Iron for Engineers, Boiler Makers, Ship Builders, Builders, &c., in Bars, Plates, Flitch Plates, Angles, Tees, J-Stay, Channel, Hoops, Sheets, Rods, &c., to Specifications or from Stock.

For Section Sheets, Prices, and other particulars, apply to

**HENDERSON & GLASS,**

**VULCAN STREET IRON WAREHOUSE, LIVERPOOL**

**STOCK OF ROLLED GIRDERS,**

Of all sizes up to Sixteen inches deep, and assorted lengths, always on hand.

**CASES FOR BINDING THE ARCHITECT**

PRICE TWO SHILLINGS.

OFFICE: 175 STRAND, LONDON, W.C.

ld, silver, and other medals, with diplomas of honour, testify to the success which has attended the endeavour of Mr. Maignen to produce a perfect article. The means by which the result has been obtained—in other words, the construction of the filter, the composition of the filtering materials, the mode of aerating the water—has been before described in this journal, and may be seen at the present exhibition. Persons who have not tried them will find a satisfactory voucher for their efficiency in the fact of their being used by the Government in the Soudan campaign. The principle is carried out for purifying water on a large scale, and Mr. Maignen estimates that it can be cheaply used for filtering water-supplies to villages, towns, &c. The patent process for softening water is devised to act on small quantities of water, and also furnish supplies of softened water on a large scale.

*Wilkes' Metallic Flooring and Eureka Company (Limited).*

THE WILKES' METALLIC FLOORING AND EUREKA COMPANY (Limited), 17 Devonshire Square, E.C., make a most varied and imposing show. The first thing that strikes the eye is a handsome Ionic portico, executed in red concrete, with fine columns and pilasters, carrying an enriched entablature. Among the many applications of the material will be admired the examples of balustrading, and one is a fac simile of work taken from old Northumberland House. There is a beautifully executed head to form a balustrade; and a curiosity, exceedingly ornamental, by the way, is a skilfully executed perforated enrichment put into a hollow cove in a building. Also very effective are the hammered coigns, Scotch in character, just as they came from the mould they were cast in. Garden fountains are varied by ridge tiles, &c.; and, coming to more ornamental articles again, concrete figures under the shapes of birds and flowers. And there are busts and statues, medallions, panels, and friezes, figured, floriated, and of enriched design. Mr. W. Millar, foreman to the firm, is responsible for the designs

of all the work throughout, as he designed it. He certainly needs no other testimonial of his powers than what is seen in his excellent work. Among these ornamental works a bust of the Prince of Wales may be seen, also a fine plaque representing *Flora*, and among the figure-castings is a *Venus de Milo*, the casting of which was done in one hour. Some of our readers may be astonished when it is said that this firm can by their hardening process, which is employed throughout for all productions, cast figured or other work, however delicate the details may be, in an hour's time out of gelatine moulds, and several casts have been obtained in a day from one mould: this is quite novel. All the exhibits, too, are shown just as they came out of the mould. Then there is fibrous and fireproof plastering. Some handsome medallions show that fibrous plastering lends itself readily and effectively for ornament. The little sanctum at the stand shows walls composed of fibrous slabs, by use of which dirt as well as laths is dispensed with. Cornices and enrichments are another feature of work in this material just taken up by the firm. The material used as fireproof plastering is waterproof and fireproof, patented during the last few weeks. A part of iron column and girder encased with the patent is shown. A dark core or basis takes a white finishing surface, and what is quite novel and has not been done before is, that both are at once cast together as one piece. Ironwork thus encased acquires an enormous strength. The metallic flooring is made for every purpose, for street pavements, stables, car and engine-sheds, railway platforms, malshouses, granaries, fireproof floors, warehouses, tennis courts, &c. There are specimens of the paving for the Old London Street for the Inventions Exhibition, also for cavalry stables for the War Office, &c., and many samples of staircases that have been laid in various establishments—for example, at the Oxford and Cambridge Mansions, artisans' dwellings, also for Messrs. G. Rowney & Co., Euston Road, &c. Among the names of various architects who have used them may be mentioned Messrs. Davis & Emanuel, Messrs. Ebbetts & Cobb, &c.

The staircases are in red and in grey, smooth and also grooved treads. The work, it will be seen, shows both treads and risers are of the concrete. Space will not, however, allow of more, and enough has been said to point out the wide range covered by the productions of the firm.

*E. PLOWMAN.*

MR. E. PLOWMAN, brick and tile manufacturer, Lower Gravenhurst, near Amptill, Beds, shows some capital building materials, a speciality of his being the very hard gault bricks and buff facings. There are red gaults for paving purposes, which produce a pavement of exceeding durability as well as affording a good foothold. No fear of slipping on them as on some tile floors. An inspection of the gaults varying in colour, in white, buff, red, &c., is sufficient almost of itself to speak to their general excellence. There are ridges, crestings, copings, plain tiles, and pantiles the cheapest yet made for agricultural purposes; also agricultural drain-pipes. Bricks are seen also perforated, which of course would be a saving of freight where large quantities are conveyed. The bricks may be used anywhere, for, wherever put, weather will not affect them. The bricks have been tested at Messrs. Kirkcaldy & Son's Brick Testing and Experimenting Works, Southwark, with the result that a single brick resisted a pressure of 40 tons, and a square foot a pressure of 158 tons. They were also used for the new bridge at Bedford, the facing bricks for the bridge and also for the grammar school having been supplied by Mr. Plowman.

*Alfred Putney.*

MR. ALFRED PUTNEY, Baltic Wharf, Harrow Road, W., shows his patent "Pavodilos" solid wood flooring. Under the name "Pavodilos" Mr. Putney has registered his patent lock-joint flooring, floor borders, panel, dado, and V-jointed boards. The beautiful work Mr. Putney shows at the hall has been subject of remark. Of late years many persons have recognised the multitude of evils in the old-fashioned floor so long concealed and abetted by carpets, and have tried to remedy matters by discarding

## BELLMAN'S PATENT GULLY.

*This Gully possesses the following advantages:—*

**Receives and disconnects one Rain-water Pipe and Three Waste Pipes.**

**Avoids all Splashing.**

**Ventilates the Pipes and Trap.**

**Forms Drain for Area or Surface.**

**Is easy of Access for Clearance.**

The ordinary P or S trap to be used in connection with Gully being in a separate piece, can be placed at any angle to meet the drain exactly, thus insuring a perfect joint, the Gully being fixed at right angles. This is a great advantage over other arrangements made with the trap in one piece.

*The Holes for Rain-water Pipes are made both Circular and Square and of various sizes.*

DESCRIPTIVE CIRCULAR ON APPLICATION.

**THIS GULLY IS HIGHLY RECOMMENDED by Authorities on Sanitary Matters.**

**PRICE AT WORKS, 8/6 EACH.**

Also SINGLE GULLIES, for Sink Wastes only, price 3/9 each.

**BELLMAN & IVEY, 95 Wigmore St., London, W.**

**BUILDING EXHIBITION.—STAND 209, AVENUE E.**

## THE INDESTRUCTIBLE PAINT CO., LIMITED,

27 CANNON STREET (corner of BREAD STREET),

**LONDON, E.C.,**

were awarded the GOLD MEDAL (highest award) of the International Health Exhibition, and the Diploma of Honour (highest award) of the Great International Fisheries Exhibition, for BROWNING'S PERMANENT PRESERVATIVE SOLUTION and PAINTS.

carpets, and putting down a second or veneer floor called parquet. The Pavodilos solid wood flooring is specially designed to remedy the disadvantages of the ordinary nailed floor, and to obviate the necessity for a double or veneered floor. These ends the Pavodilos flooring is designed to secure most completely and economically. By an ingenious mode of interlocking throughout the sides of each board, a perfectly smooth, air-tight, and dust-proof surface is obtained, free from nail-holes and indentations. By the lock-joint arrangement, various coloured fancy woods may be used for producing borders or patterns at will, most pretty and artistic results being obtained by this means. In point of cost, durability, and solidity the system certainly recommends itself, and any one who looks at the work exhibited, cannot fail to see what very ornamental work, characterised by great good taste, is attained by a process of simplicity marked by much ingenuity. The ornamental effect to be produced will depend on the amount of taste brought into play in properly selecting and arranging various woods for pattern or border. The different woods are to hand. Passed through a machine they are all of one thickness, and work in flush together. Variety of colour and blocks or slips of varied widths and dimensions enable a person by judicious choice to produce an effective design equal to parquetry-work. The combinations that may be made are endless; happy contrast is the point to be studied. The inexpensive character of the work, far from being objectionable, is just what the bulk of people, however deep their purse may be, as a rule regard as a merit. The floors shown and borders are quite sufficient to denote that the process has a future before it. The section of a board on inspection will show the means by which the lock-joint is effected. On one side is a tongue and angle above; on the other side is a groove to receive the tongue, and a shoulder to fit in angle. The upper surface of the tongue is on the incline, so as to increase the strength of the tongue and give greater accessibility for driving in pins, nails, or screws, the groove and shoulder fitting over and hiding the nails. The angular set of the upper part of

the board clenches the shoulder and prevents rising or warping, and thus insures a perfectly even surface and a perfectly air-tight and dust-proof joint, the whole forming a solid flooring of unusual durability, three times as durable as a veneered floor. Moreover, it can be taken up and relaid without injury, or a board can by a simple arrangement be lifted and relaid without cutting in case of need.

*M. C. Duffy & Son.*

Messrs. DUFFY, of 66 Stork's Road, S.E., show a large variety of builders' turnery goods, including balusters, newels, hand-rails, table-legs, as well as some specimens of their wood-block flooring and wood paving, suitable for schools, churches, &c. Hack-covers, hack, lorry, pallet-boards, and strikes.

*Joseph Westwood.*

Mr. JOSEPH WESTWOOD, jun., Napier Yard, Millwall, E., shows many and varied applications of Hawksley's patent treads, which are so well known in practice, and which combine, as nothing else does, the qualities which have secured their reputation. Go where one may, they will be found in use all over London and throughout the United Kingdom—in railway stations, barracks, post-offices, hospitals, schools, public and private buildings, hotels, warehouses, offices, &c. Any person may see how they stand wear and tear in the stairs of the Metropolitan District Railway, to quote one example; and it may also be noted that sample steps, placed in the centre staircase of Dalston railway station, and with a traffic exceeding 6,000 passengers each day, or a total of more than 6,570,000 persons in three years, did not wear down from their original surface more than one-sixteenth of an inch. A specimen shown of the floor laid at the Corn Exchange, Mark Lane, with the enormous traffic there, is yet another proof of its wonderful durability. The latest adaptations show the system applied to hydrant covers and trolley wheels, also to steps from house to garden or conservatory. This trolley wheel will outlast many iron wheels, besides which it is noiseless, does not cut up floors, and can be

worked more easily by a lad than the mere iron wheel can be by a full-grown man. The patent treads are also applied to stairs and ladders, and also for stables, in which they afford a clean and warm bed-place for horses, being easily cleaned, and liquid draining off naturally to gutter.

*"Electric" Paint Remover Co.*

The "ELECTRIC" PAINT REMOVER CO. (Limited), 3 Westminster Chambers, Victoria Street, London, S.W., bring under notice their "Electric" Paint Remover (formerly manufactured by Rendle Bros. and the Alliance Manufacturing Co.), which has obtained an excellent name for the rapid and efficient manner in which it does its work. It has completely superseded all the old and laborious methods of pickling, scraping, and burning off. Although it has only been in the market a few years we are informed that it has been universally adopted by painters, decorators, builders, contractors, and most of the leading railway, steamship, omnibus, and other companies have successfully utilised it for different purposes. America and the colonies have used large quantities of the "Electric" Paint Remover, as it is a great labour-saving material, and yet so economical in its action. Paint, varnish, tar, grease, &c., vanish like magic from wood, stone, iron, marble, &c., before the action of the Remover, and yet it has not the slightest injurious effect on the last-mentioned material, neither is there to be found any trace of lime or other injurious compound in the paste itself, which is of a creamy consistency, and without the slightest offensive smell. Owing to the chemicals being now manufactured in such large quantities, and through improvements in the machinery, they have now greatly reduced the price of the "Electric" Paint Remover.

*Martin & Co.*

A capital array of carvings suitable for interior and exterior decoration will be found at the stand of Messrs. MARTIN & Co., of 27 Newman Street, W., consisting of cornices, dados, panels, chair-rails, doors, mantels, skirtings, &c.

## THE WEST CENTRAL SANITARY ENGINEERING CO.,

WM. SMEATON, Senr., Manager,

AWARDED by the JURIES of the INTERNATIONAL HEALTH EXHIBITION, 1884,

**GOLD MEDAL,**  
**FIVE SILVER MEDALS,**  
AND  
**TWO BRONZE MEDALS.**

**GEORGE WOOLLISCROFT & SON,**  
Chesterton Tileries—North Staffordshire; Canal Tileries—Etruria, Stoke-on-Trent; Patent Tile Works—Hanley, Stoke-on-Trent.

MANUFACTURERS OF ALL KINDS OF

Blue Bricks, suitable for Railway and other purposes. Roof, Ridge, Garden, Encaustic, Glazed, Printed, Painted, Hearth, and other Tiles. Hydraulic Pressed Roof and Floor Tiles, suitable for Churches, Public and other Buildings, as they are lighter, harder, and will not absorb 25 per cent. of water, compared with the ordinary-made Plastic Tiles. Also Paving Bricks made from the above process, and from Rock Marl.

Depot—25A Cookridge Street, LEEDS. LONDON AGENCY—52 Finsbury Pavement, E.C.

SAMPLES AND PRICES ON APPLICATION FREE OF CHARGE.

*S. Ransom.*

Mr. S. RANSOM, Epoch Saw Mills, Kensal Road, Westbourne Park, makes show of exceedingly good work, notwithstanding that the original exhibits intended to be shown were all burnt in the fire that cleared out his premises on the 8th inst. All the articles exhibited are ordinary designs, such as could be brought together at short notice. Mr. Ransom has taken temporary premises, so that business is going on as usual, and he is in a position to complete present contracts and execute future orders. A portion of an old carved staircase, designed by Sir Christopher Wren, and erected about 1670, is shown. It is taken from Kennan's Hotel, Cheapside, which is to be rebuilt, Mr. Ransom having the order for the staircase. Specimens showing handsome wood-work put up at Ennismore Gardens are shown, portion of landing with carved fascia, Corinthian newels, rail, &c., and other good work in character. Among staircase details will be noticed the handrail scrolls and wreaths, variously-designed newels, Queen Anne included. The newels are all hollow-cored, which, besides preventing the wood splitting, is convenient for the introduction of a gas-pipe.

*Houghton, Brown & Bros.*

Messrs. HOUGHTON, BROWN & BROS., Kingsbury Ironworks, Ballspond, N., have at the hall an 8 horse-power portable engine, and two 4 horse-power semi-portable engines, a 6-foot "A1" mortar-mill, circular saw benches, the same also with rise and fall spindle, and a combined patent circular and band sawing machine, an improved moulding machine, band-saw machine, patent friction barrow-hoist, a mortising and boring machine, and saw-sharpening machine. The two 4 horse-power engines are most handy as well as handsome engines. The boilers are felted and cased in mahogany. The engines are constructed all of the best materials, with first-class workmanship equal in finish to the best locomotive work. An improved vertical moulding machine should be noticed, being particularly adapted for irregular mouldings, besides straight mouldings and other

work, as the action is reversible. The reversing motions are obtained by an ingenious arrangement in the counter-shaft, entirely dispensing with the objectionable use of friction or gear wheels. All the machinery of the firm is noted for good workmanship, and whatever the purpose of the particular machine sawing, mortising, and boring and the like, steadiness in working, absence of vibration, &c., is secured. The wood-working machinery manufactured by this firm is devised to fulfil a great variety of purposes. They are known also for their improved mortar mills, mortar-mixing machines amongst other articles on their list that applies to building matters, and their productions have received the approbation of the home and Indian Governments as well as of foreign Governments.

*The Willesden Waterproof Paper Company*

Have an exhibit illustrating the waterproof character of their Willesden paper, and some of the many purposes to which it can be applied, including a water-wheel and launder, a roof, a tank, &c., &c.

*William Johnson.*

Mr. WILLIAM JOHNSON, Cardigan Works, Leeds, shows his new patent brickmaking machine for plastic or semiplastic brickmaking, as also the new patent lever brick-pressing machine, the two machines being designed to work in conjunction with each other, and to turn out 10,000 best finished fronting bricks per day, with three boys, at a cost of 5d. per 1,000. The press can be made for pressing hand-made bricks or bricks made by any other brickmaking machine, and may be used for work of the finest kind. The special points aimed at in the construction of the machinery are to secure simplicity, strength, and absence of friction, with consequent increase of power, regularity of working, economy of labour and wear and tear, and the production of a superior quality of brick. When in use the clay is received direct into a hopper, in which works a plain ram heated by steam. The moulds are formed in a revolving cylinder, and are fed by the ram, the action of which feeding propels the brick from

the mould diametrically opposite on to a table. By a simple arrangement the hopper is kept in constant agitation, which insures regularity of feed and a perfect quality of brick by regulation of pressure on the brick. In the brick-pressing and briquette machine, pressure is given by a powerful lever at  $2\frac{1}{2}$  to 1, with a minimum of loss by friction, the whole power by gearing and lever being brought directly on the substance pressed. The motions for feeding and delivery of the brick are direct and firm in action, and are regulated in a simple manner, so that there is no varying, being only affected by wear and tear, which is provided for. This machine may be had also in a form not only adapted for brick-pressing, but as designed more especially for briquette-pressing, by providing more powerful leverage.

*Engert & Rolfe.*

Messrs. ENGERT & ROLFE, Felt Works, Barchester Street, Poplar New Town, E., have brick-work set in a cistern of water, to show the mode of application and the efficacy of fibrous asphalt as an anti-damp course in walls. Rolls of the various felts manufactured by the firm can also be inspected at their stand, viz., asphalted roof felt and felt for lining roofs, including bituminous or inodorous felt, sarking felt, hair felt for boilers, &c. Messrs. Engert & Rolfe are contractors to our own and to several foreign Governments, and the name of the firm is, one may say, long since a household word.

Among other exhibits yet to be noticed, and which will be described next week, are those of Mr. JOHN MATTHEWS, Weston-super-Mare; Messrs. MEAKIN & CO., Baker Street, W.; Messrs. J. T. PENNYCOOK & CO., Ironmonger Row, E.C.; Mr. J. F. EBNER, Clerkenwell Road; Mr. JOHN SMEATON, Ludgate Circus; THE DUNTON GREEN RED BRICK WORKS; Messrs. ARCHIBALD SMITH & STEVENS, Leicester Square; Messrs. WILLIAMS & NASH, Castle Street, Holborn; Messrs. T. WILSON & CO., Stowmarket; Mr. G. A. WRIGHT, Westminster Chambers, &c.

### CASES FOR BINDING THE ARCHITECT.

Price Two Shillings.—Office: 175 Strand, London, W.C.

# "THE PEDESTAL VASE," JENNINGS' IMPROVED W.C. APPARATUS

(Combination Urinal and Slop Sink).

Registered No. 16,300.

A PORCELAIN VASE set on a tiled or mosaic floor, within walls or a dado of glazed tiles. The usual wood framing, forming a storehouse for the retention and accumulation of *damp, dirt, and disease germs*, with the joints, crevices, and imperfections in work which the closet enclosure so often conceals, is entirely abolished. The seat is hinged, permitting free access for use as a *slop sink* or *urinal*, and for cleansing, so that the entire apparatus and space can be freely washed down. For this latter purpose the floor should be slightly sunk, and laid to fall to a grating, with waste carried through the external wall, and terminating in a copper flap valve to prevent draught.

The suggestions as regards wall linings and floor, may, of course, be modified as best adapted to the building in which the closets are used; and in the consideration of such details, alternative schemes will readily present themselves.

At the recent **HEALTH EXHIBITION** (South Kensington, 1884), amongst a series of official tests, under the supervision of Baldwin Latham, Esq., C.E., and the Jury No. 9, Class XXIII., and successfully withstood by this closet, the following may be cited in evidence of its efficient action. Being fixed in position shown in illustration, with "**JENNINGS' PATENT SINGLE FLUSH WASTE-PREVENTING SYPHON CISTERN**" 5 feet over, with  $1\frac{1}{2}$  inch down pipe, ten apples (averaging  $1\frac{1}{4}$  inch diameter) and a flat sponge about  $4\frac{1}{2}$  inch diameter were thrown into the basin. The water, as well as the whole of the exposed or dry surface, was first blackened with plumber's "smudge," and the sides covered by four pieces of thin sanitary paper, which adhered closely to the soiled surface. The handle of the cistern was then pulled, and the two-gallon flush liberated. After seven seconds (the time occupied by the discharge), a receiver placed under the trap outlet was removed, containing in the blackened water the **ten apples, the sponge, and the four pieces of paper**, no traces of the soil remaining visible upon any part of the apparatus.

**GOLD MEDAL AWARDED.**

THESE CLOSETS are already in use in Hospitals, Banks, Hotels, Offices, Private Residences, &c., with most satisfactory results, and, fixed in the manner described, in appearance and action leave nothing to be desired. By the novel arrangement of the supply to Basin, as shown in the sectional sketch annexed, the whole surface is well flushed and cleansed, whilst the bottom of Basin and Trap are thoroughly scoured by a concentrated rush of water which insures the **instantaneous removal** of the contents, thus overcoming the inherent defects in the many imitations recently produced of "**JENNINGS' MONKEY-CLOSET**" (the original form of wash-out watercloset), which was invented and patented by G. J. in 1852.

**GEORGE JENNINGS,**  
SANITARY ENGINEER, STANGATE, LONDON,  
A VISIT TO THE SHOWROOMS IS RESPECTFULLY REQUESTED. S.E.

**WILKES' METALLIC FLOORING AND  
EUREKA CONCRETE CO., LIM.**

HIGHEST AWARD: Only Gold Medal for Paving, International Health Exhibition, 1884.

By Appointment to the International Inventions Exhibition, South Kensington, 1885.

Diploma of Honour, the International Medical and Sanitary Exhibition, South Kensington, 1881.

Diploma of Honour, Only Award for Paving, Brighton, 1881.

Crushing Strain by Kirkcaldy, 3 slabs 6 in. by 6 in. by 2 in. (36 super inches),  
being about 15,000 lbs. per cube inch.

FOR STABLES, CAR SHEDS, RAILWAY PLATFORMS, STREET PAVEMENTS, BASEMENTS,  
TENNIS COURTS, ETC.

Structural work in grey, red, or other coloured Eureka Concrete.

Over one million super feet laid during the last three years.

Price Two Shillings.—Office: 175 Strand London, W.C.

# The Architect.

## THE WEEK.

MESSRS. LEEMING & LEEMING have completed their matured designs for the new Admiralty and War Offices. We have been permitted by Her Majesty's Office of Works to reproduce the views. But as any publication on a small scale so as to fill a double page is likely to make people form an erroneous notion of the designs, and therefore will not serve either the architects or the public, we think it better to wait until next week, when, without sacrificing men's work in a scramble, we can give plates that will be uniform in size and quality with those representing the nine premiated designs which we published last year, and which were considered satisfactory by the profession.

THE following letter has been written by Mr. HERKOMER, A.R.A., to the secretary of Messrs. WILLIAM COOKE & Co., Limited, Tinsley, Sheffield, in reference to the announcement that the workmen offered to work for nothing during a week to assist the firm:—"As an artist who watches with the keenest interest the lives of workmen, I trust I may be permitted to offer my admiration for the noble act your workmen have decided upon—to help their masters out of a great crisis. Such an act belongs to the world, and ought to be historical. If followed up now it is sure to bring the best of times and lift the gloom that hangs over everything. These are traits to which we must look for future safety rather than to Governments. A sacrifice by a workman must bring gratitude from the master, and a master's gratitude is worth striving for. I trust I may be permitted to have my admiration conveyed to your workmen, for in a small way the men who are working for me in wood carving and in wrought iron-work are closely bound up with my own life. Their sorrows are mine, and my joys are theirs." The secretary in reply says that the praise received from artists and writers has been gratifying to the men.

THE utility of statues which are displeasing is not apparent, and if a few of them were destroyed, who knows what a beneficial effect might be produced in sculpture? It was proposed on Tuesday in Birmingham that the statue of the late GEORGE DAWSON, by Mr. WOOLNER, R.A., should be broken up, if permission could be obtained from the corporation. The executive committee appointed by the subscribers had reported that the best place for it was at Mr. Dawson's grave in the general cemetery. But it was said that there would be desecration in having a figure of the kind in that place. One gentleman, it appears, offered ten guineas for the statue in order that he might conceal it from the public. Eventually a suggestion was adopted to place the figure in the Free Library.

MR. PEDDIE's long-expected Bill for the Disestablishment of the Church of Scotland has at last been printed. If passed it will come into operation on January 1, 1887. It proposes the formation of a body to be known as "The Commissioners of Church Temporalities in Scotland," in whom all churches, manses, and ecclesiastical buildings are to be vested, and after Whitsunday 1877 the congregations and ministers are to be their tenants. There is to be no obligation or liability on the part of any person, body of persons, corporation or municipality, to maintain or uphold the fabric of any manse, church, or ecclesiastical building; and no rate or assessment is to be levied or made for the building, rebuilding, or repair of churches or manses, or for providing or enlarging any glebe, or the providing of communion elements; except in cases where, prior to the passing of the Act, an assessment has been made for the building or repair of any church or manse, and the works have been begun or the contracts for the same have been entered into, when it shall be lawful to levy such assessment. The Commissioners are to have the management of the churches or ecclesiastical buildings or structures, and manses and glebes which form part of the property, vested in them, and shall have power to lease, sell, or feu the same, either by public auction or private bargain, but only

for a fair and adequate price or consideration in money or in money's worth; they are to give the preference to offers by or on behalf of the congregation previously using the churches or ecclesiastical buildings or structures, or whose ministers previously were entitled to the possession of the manses or glebes, provided a fair and adequate consideration shall be offered. The money is to be invested in such a way as the Treasury may determine. All churches or ecclesiastical buildings, or structures in burghs which are the property of the corporations, including the parish churches in Paisley, are to be under the exclusive management of the magistrates and town councils of such burghs, any existing law or custom to the contrary notwithstanding; and they shall have power to lease or dispose of the property under similar conditions to the Commissioners.

THE syndicate principle is about to be tried in art. The first experiment will be made in Edinburgh. It is proposed to form a fund by means of annual subscriptions, with which to purchase works of art. They will be distributed by annual ballot. The principle resembles that of the Art Union, but we suppose there will be more liberty of action on the part of the committee.

WHEN it was proposed to erect four equestrian statues on Blackfriars Bridge, we pointed out the difficulty of a selection, and the report of the Bridge House Committee confirms what was then said. Twelve subjects were proposed, viz., *Alfred the Great, Harold, Richard I., Edward I., Edward III., The Black Prince, Henry V., Cromwell, St. George of England, St. Andrew of Scotland, St. Patrick of Ireland, and St. David of Wales.* The combination is almost as odd as the description given by the showman when he announced that he had figures of their Majesties *The Czar of Russia, The Sultan of Turkey, and The Isthmus of Panama.* When the committee were at work on legendary lore, they might as well have included the entire Seven Champions of Christendom. The big group has been broken up into three in order that the Council who pay the money may have their choice. No. 1 group is made up of *Richard I., Edward III., The Black Prince, and Henry V.* No. 2 group consists of *Alfred the Great, Harold, The Black Prince,* and as the difficulty of the Westminster Commission about having a statue of *Cromwell* was remembered, the Council can have *Edward III. or Henry V. instead of The Protector.* The four saints form the third group. One of the Irish bishops lately complained of the morose countenance which was given to the patron saint when he was figured in prints, but what will he say when he reads that *St. Patrick* is shown careering on a prancing steed? The proposal to put up an equestrian statue in honour of little TOMMY MOORE, the songster, was proxy in comparison. We suppose the saints are to have the fine florid looks of *Gog and Magog* in the Guildhall, the two statues which, to the aldermanic mind, are finer than the Parthenon marbles. Life in the City is stern enough; and probably the Council thought that four such figures would excite a laugh even in the wayfarers; but their good intentions are not likely to be carried out, for the report has been sent back to be again considered.

A RETURN has been published this week which shows that the gross rental of Glasgow, including railways and canals, &c., as shown by the valuation roll, is 3,406,370*l.*; last year it was 3,432,114*l.* The decrease is thus 25,744*l.* The gross rental of dwelling-houses within the city is 1,310,732*l.*; last year it was 1,309,921*l.*, showing an increase of 811*l.* The gross number of dwelling-houses for the current year is 119,554; last year it was 119,648, a decrease of 94. The number of unoccupied houses this year is 6,187; last year it was 7,124, a decrease of 1,937. The gross rental of premises other than dwelling-houses, including railways and canals, &c., for the current year is 2,095,638*l.*; last year it was 2,122,193*l.*, a decrease of 26,555*l.* The gross number of these premises for this year is 25,384; last year it was 25,432, a decrease of 48. The number of this class unoccupied this year is 3,888; last year it was 4,276, a decrease of 388. These figures show that as the unoccupied houses become fewer, the number of unoccupied shops, &c., is reduced very much in the same proportion.

## HONOUR TO REJECTED PICTURES.

THE Paris journalists of late years have turned their influence to account by organising exhibitions and entertainments in order to give assistance to various benevolent institutions. They now intend to hold an exhibition of works by painters who are recognised as masters, but which have been from time to time rejected by the Salon judges. As they propose to go back to the beginning of the century, it is needless to say there will be no difficulty in finding works of the kind that would be sufficient to cover the wall space of several galleries. Apart from the interest that will belong to the works if considered individually, and from the circumstance that what was meant to be a reproach has become a mark of merit, the collection is likely to be more truly illustrative of the history of French art than if it had been one of the so-called representative exhibitions. In the majority of cases the pictures which were rejected attained that distinction because they were in advance of the laws of the judges. The pictures will exemplify the struggle for freedom in France, by which artists all over the world have been the gainers. If, at the present time, the Salon juries are willing to recognise individuality, if in exhibitions elsewhere there has been a relaxing of pedantic rules, the revolution was brought about by the sufferings of French artists, and the pictures in the forthcoming exhibition will, from younger artists at least, obtain the reverence that belongs to relics of an age of persecution.

It is not to be supposed that the limitation to the present century was caused by the difficulty of obtaining works of an earlier time, but simply from the fact that the practice of rejection was systematised by a clique of Academicians in the beginning of the century, and more particularly by DAVID, the painter, who at that time was, in his way, as great an autocrat as NAPOLEON himself. Almost every year one hears of revolutionary schemes for the extirpation of Salon juries, which are at once ascribed to the rage of men whose works are unworthy of admission to the exhibition. But, whatever may be said against them, they can be defended on the ground that they are in accordance with the original arrangements, for, strange as it may seem, the juries do not date from the foundation of the exhibitions.

Like many other powerful institutions, the Salon exhibitions have had a very simple beginning. In the regulations of the Academy that was founded by painters and sculptors, which were sanctioned in 1663, it was prescribed that all the officers and Academicians should bring an example of their work to help in decorating the place of meeting. It is evident that the public were permitted to enter the rooms in the Palais Brion, for it is recorded that in 1667 the porter was allowed a gratuity of fifteen livres for his trouble during the fortnight of the exhibition. The works sent by the students in the Academy at Rome were shown in 1669, and the other students were encouraged to express an opinion on them. The collection soon became too large for the rooms, and two years afterwards the exhibition was held in an open court. There was so little advantage arising to the Academicians from such modest shows that they grew remiss in sending works, and there was great difficulty in obtaining pictures to hang on the walls. Then came the wars of LOUIS XIV., the religious dissensions and persecution of reformers, and the exhibitions were closed.

Through the influence of MANSARD the Academicians obtained a local habitation in the Louvre, where they opened an exhibition in 1699. As the gallery was adorned with great magnificence for the visits of the King, it was called the Salon, a title which, in spite of all the transformations France has undergone, is still retained by the exhibition. The exhibitions were not held at regular intervals. It is known that one was held in 1725, when a prize of 5,000 frs. was offered to the authors of the two best pictures. As is customary, there was great dissatisfaction with the verdict. The Academicians who were not competitors selected LEMOINE'S *Contenance of Scipio* and DETROY'S *Return of Diana*. But the public preferred a picture by COYPEL, and the Academy was supposed to have displayed favouritism. For nine years afterwards there was no exhibition. Another attempt was made to revive them in 1737, when the Salon Carré, where the gems of so many

schools are now collected was assigned to the Academy. There the exhibitions were held during many years.

For about ten years they were annual, but the public complained of the quality and the number of the works, which amounted to about two hundred on an average. The grievance was brought before the King, and a new arrangement was adopted. His Majesty considered that one hundred and fifty good pictures were enough for a gallery, and it was ordered that the Academicians should on August 17 (eight days before the opening on the feast of St. LOUIS) deposit their works in the gallery called after APOLLO, and that on the next day a jury was to be nominated, by whom all the works were to be examined impartially, and those among them which were considered unworthy of the public gaze were to be eliminated. This was the beginning of the jury system, which was unknown for more than half a century. It was not a success, for, in spite of the preliminary investigation, the quality of the pictures was not advanced, and in 1751 yearly exhibitions had to be given up, and for forty years they were biennial.

The hanging was a difficulty then as now. At one time it was undertaken by a conservator of the King's pictures, who managed to escape to Versailles before the exhibition was opened. A painter was associated with him in the hope that more care might be exercised, but without much advantage. It was decided that the Academicians should undertake the office in turn. This arrangement did not succeed. The next experiment was to make the pictures take the best and worst places in turn. The visitors were horrified when some of the pictures were put on a level with their eyes, and good and bad works were confounded. The sculptors were harder to please than the painters. Every exhibition gave opportunity to the pamphleteers, who were sure to have the aid of the artists who were jealous of the Academicians in pointing out the shortcomings of the pictures and statues. As the exhibitions were always free, there was no lack of critics, for, to the credit of the old French Academicians, it must be said that they were not mercenary. They even scorned to take the profit that was derived from the sale of the catalogues, and it was handed over to the servants until COCHIN, who was wealthy, sought the amount for himself in his quality of editor, when MARIGNY, who, as director-general of buildings, had the control of such things, decided that the profits should go to the funds of the Academy.

The Salon exhibitions were, as we have seen, entirely academical affairs; but the Revolution broke down the barriers, and it was decreed that there was to be no longer a privileged occupation of the Louvre galleries. Every artist—a stranger equally with a Frenchman—became entitled to claim admission for his work. There was a sort of dramatic generosity about the announcement which was in keeping with the time. In 1789 there were 350 works exhibited; after the decree the number rose to 794, and the Academicians feared to reject more than two. The Academy of Painting and Sculpture, in common with many societies, was suppressed by the Convention in 1793, and a Commune Générale of the Arts took its place. France was fighting for existence against hordes of enemies within and without its frontiers, but artists found time to work. The first exhibition of the Commune contained no less than 628 pictures, 182 pieces of sculpture, and 24 architectural designs. Among the pictures were three which had been commissioned by the Convention, the subjects being taken from ancient history.

The Convention soon found that generosity must succumb to space. There was a limited area in the galleries, and more pictures than could be hung on it. A Committee of Selection was inevitable, and, like all the tribunals of that time, it was made up of incongruous elements. Not only artists, but writers, scholars, actors, gardeners, shoemakers, soldiers, and attorneys were made judges of the pictures. They looked for principles rather than for art, and, with a consistency that must ever delight the creators of new styles in painting, it was suggested that the prizes should be awarded amongst the men whose works had to be rejected, for, by ignoring antiquated formulas, they displayed the republican spirit in the greatest strength. The chaos could not continue long. It was found that the artists and the laymen were at cross purposes about the bestowal of medals—a kind of honour that was unknown to

the Academicians in the days of the Monarchy—and eventually the Minister found that he had the sole responsibility of the Salon exhibitions on his hands along with many much more important affairs. It is not surprising that, under the circumstances, PIERRE BENÉZECH wished to have longer periods between the exhibitions. He found to his cost that he could not dispense with a jury of some kind, unless he was ready to take the blame on his shoulders at a time when blame might be fatal. Examination was again adopted in 1798, and an appeal was made to artists that they should submit only the best of their works.

With the advent of BUONAPARTE there was no longer a question of jury or no jury. Whatever might be the nominal judgment-seat, the entire power was in the hands of DAVID, who, during Consulate and Empire was the lawgiver on French art. He was an opponent of the King's Academy of Painting and Sculpture, and may have thought that the jury system was no more than a relic of an abuse which he had tried to suppress. The effort to reproduce the republicanism of BRUTUS and the antique Romans was found to be a delusion; but DAVID believed that what was impracticable in politics could be done in art. The antique was forced on painters in spite of themselves. The Restoration brought a nominal freedom, for DAVID's spirit was still supreme. The juries were drawn from the Institute of Fine Arts, and they descended among artists with the coldness of the antique gods. They were assured of their Olympian seats, and it mattered little how often men might break their hearts in raging against them. DAVID told a story of the refusal of the Academicians to admit an able painter on the ground that he might disturb their equilibrium, and for years after the Restoration many an artist was sacrificed in the effort to preserve equilibrium. Pictures were kept out of the Salon because of their originality, and at length the painters who belonged to the section of painting and were judges became so indifferent that they left the selection to architects. The bad system continued down to 1848, and among the men who have suffered because they were endowed with genius, were such artists as GERICAULT, DELACROIX, MEISSONIER, THEODORE ROUSSEAU, JULES DUPRÉ, COROT, JEAN GIGOUX, and DAUBIGNY. If there was a likelihood that the visitors might say on looking at a picture, "That is by a new man," the painter was doomed to exclusion.

The Revolution of 1848 gave a chance to the artists of seeking judges who were inspired by modern ideas. The Government of that time tried to follow in the footsteps of the first Revolutionists, and opened an unrestricted Salon. It was not a hopeful exhibition. A jury which was formed of officials and artists was afterwards tried, but it was ineffectual, and in 1857 the selection was once more entrusted to members of the Institute. But it seemed impossible to extirpate the traditions of that body, and artists had to pay the penalty if they disliked stereotyped rules. As the Imperial Government grew weak concessions were offered in all departments, and the artists were permitted to elect a large proportion of the juries. Mixed commissions are, however, rarely workable, and the difference in opinions between the representatives of the artists and of tradition brought no advantage to the exhibitors. "I prefer," wrote M. ZOLA, "the good old Academy, with all its faults. With it there were no surprises; it was constant in hate and friendship. Now there is no knowing where one is. If I were a necessitous painter I should try and discover who were to be my judges, and paint to suit their taste."

Happily there is less need nowadays for an artist to think of the jury than of his own ideas. A Salon exhibition is no longer illustrative of one system of painting. Variety is visible throughout the galleries, and if a work is rejected it is not for displaying signs of ability. The yearly exhibitions of rejected works do not secure much sympathy with the painters, inasmuch as the majority of the works are remarkable mainly for their pretension. The proposed exhibition of the rejected pictures of past years may convince artists and the public that, whatever may be the shortcomings of the present authorities, they are far more liberal-minded than their predecessors.

**Professor Baldwin Brown** is to deliver a course of twenty lectures in the Edinburgh University, on "Architecture and Art in the Bible."

## A PROJECT FOR A MILITARY HOSPITAL.

WE drew the attention of our readers some time ago to the plan of a hospital which had been devised by Mr. JOHN MARSHALL, who is known equally by his skill as a surgeon and as a professor of anatomy. The peculiarity of it was the adoption of a circular form, which presents many advantages for effective organisation. When reviewing the book on "Hospitals," by Mr. SAXON SNELL and Professor DE CHAUMONT, we noticed some plans which had been prepared on similar lines. A design has been worked out in detail by Sir ANDREW CLARKE, R.E., assisted by Mr. INGRESS BELL, for "A projected military hospital designed for a particular site in a hot climate," which is now under the consideration of the War Office. It is illustrated by a set of careful and tasteful drawings, as well as a most elaborate model. Until the authorities shall have decided on its adoption we are not informed as to the particular place where it is to be erected. It will suffice to say that its peculiar arrangements have been made with a view to a place where the heat in summer is very great both day and night.

The history of the improvements in hospital building is a progress from unity to division, for in the war against disease the military maxim, *divide et impera*, has been proved to hold good. In the Ospedale del Santo Spirito, built by the Popes in the neighbourhood of St. Peter's and the Vatican, we have one single large hall, of the proportions of our own Westminster Hall, to receive under its roof every variety of disease and bodily suffering, from smallpox to a broken leg. Slightly different are those like the London Hospital, where in one great block of building wards are piled up many storeys high, with slight divisions between the wards—a system which, although one step towards division, is really worse than that adopted in the well-ventilated, lofty hall of Santo Spirito. The Hôpital de la Riboissière in Paris, and its copy, the St. Thomas's Hospital on the Embankment, are decided attempts towards the division of the wards. The hospital is divided in isolated pavilions, connected only by an open loggia, but each pavilion is still composed of many floors. Perhaps this is the uttermost limit of isolation we can reach in planning hospitals for crowded cities on very valuable land. But the Germans have gone still further, in doing away with all the upper storeys of each pavilion, and also with the connecting loggia. Major-General Sir ANDREW CLARKE, having an ample extent of land at disposal, has adopted the German arrangement, but has improved upon it by making each pavilion circular on plan, by which the following advantages are secured:—

1. The circle encloses a larger area and cube than any figure of equal perimeter, and therefore will, with a given length of walling, accommodate the greatest number of patients.
2. The circular form allows the whole length of the enclosing wall to be allotted to beds, saving only the actual door-openings. In rectangular wards the two longer sides only are capable of such appropriation.
3. It disposes of the question of aspecting the wards, which can be placed in any convenient position on the site.
4. It admits more light and air between the wards themselves, and thus conduces to the better ventilation of the whole site.
5. It assists in the general movement of the external air (an important matter especially in hot climates) by deflecting the currents of air which impinge upon its cylindrical surface, and it has no re-entering angles for the stagnation of the air.
6. The full diameter of the ward may be exposed to, or defended from, any desirable or undesirable quarter of the compass, as the varying circumstances of the season or hour may dictate.
7. The circular form allows of easy and perfect ventilation, the fresh air being admitted from points along its whole circumference, and, after vitiation, being attracted by artificial means equally to the central upcast shaft—in direct lines, without liability to traverse laterally the beds of neighbouring patients.
8. The circular form is in short the logical result of attempts which have from time to time been made to improve the sanitary condition of wards of the ordinary construction by rounding off their internal angles. By degrees the quadrants have been struck with ever-increasing radii, and this proceeding strengthens the view that the ultimate solution of the problem lies in the adoption of the circular form.

On account of the particular climate of the place where

this hospital will be erected, there are some special features which unite both utility and beauty, such as a large open verandah, supported by well-proportioned arcades, which surround and protect the outer wall of each ward against the sun, as well as affords a sheltered ambulatory to wheel out the patients in fine weather. Still more characteristic is the open arcading which protects the roof itself of the wards against the direct rays of the sun—an expedient adopted by the ancient Egyptians. All the buildings are to be carried out in stone, which is so cheap in the neighbourhood that ashlar costs far less than ordinary English brickwork. The elevations are simple Classic arcades, which exhibit both in their details and general proportions great refinement, and are creditable to the designers. The severity of the style is brightened by the insertion of slabs of Sicilian marble pierced with the involved geometrical designs dear to Oriental architects, in place of windows and ventilators.

We may have another opportunity of describing the arrangements in detail, and perhaps of giving fac-similes of some of the drawings. Meanwhile we refer to it as an example of an endeavour to combine the most scientific planning of a hospital with appropriate and artistic treatment of its architecture. Major-General Sir ANDREW CLARKE, R.E., A.I.C.E., has been assisted in this project by Mr. INGRESS BELL, and shares with him the credit of the result.

### TESSERÆ.

#### A Model Art School.

WILLIAM BURGESS, A.R.A.

WHAT is really wanted is a series of schools in town and country where the student, after a very few preliminary exercises, should be taught the figure, and properly instructed in it by a competent staff of masters who have been trained to teach it, who know their anatomy, and who, if required, could point out the differences between a Roman and a Greek statue. Of course I do not imply that students should go at once to the life; on the contrary, they should go through a proper course of drawing from the flat and the round in the first instance, and the art of stippling might be omitted with advantage. When a man can draw the figure, ornament becomes very easy. Certain days might be set aside for it, and certain lectures from a proper text-book (say a special edition of Owen Jones's "Grammar of Ornament") would be given at certain intervals, with the lecturer's own observations. Such schools would be attended not by workmen only—on the contrary, architects, sculptors, painters, and the students in all the cognate arts would be only too glad to obtain in them their first instruction in the figure. We should see decorators making a study, not how to avoid the figure in their designs, but how to introduce it.

#### Palladio as an Architect.

PROFESSOR DONALDSON.

The genius of Palladio does not appear to have been calculated for domestic architecture. He has rarely seemed to feel the difference which exists between private edifices and public buildings. In the elevations of his houses the large gigantic orders create unpleasant effects, sometimes extending up the whole façade in colossal proportions, at others standing on a lofty basement, and not unfrequently raised on projecting unconnected pedestals, as though hoisted on stilts. On the other hand, the public edifices of Palladio, when unrestrained by the caprice of his employers or the habits of his contemporaries, take the first place among modern productions. The Redentore and the Convento della Carità at Venice, and the Olympic Theatre and Basilica at Vicenza, announce a man of enlarged ideas, master of ancient usages, capable of appreciating and producing the sublime, and alive to the effect of every minute detail. By his writings, as well as by his buildings, Andrea has influenced more than any other master the style of architecture since his period; and, as a style, the productions of the Palladian school can be considered as inferior only to the magical works of the ancients.

#### A Theory of the Entasis.

SIR R. RAWLINSON.

Hewn ashlar masonry, if set stone and stone, or with thin beds of mortar, and the face-work either backed up with rubble or with bricks, must be weak. Neither science nor care can make such hybrid work strong, nor preserve it true in line, on face, vertically or horizontally; the backing will shrink and "draw" the face-work. I have not seen the Parthenon, and cannot, therefore, pronounce positively as to the subtle curves said to exist in the upper lines of the walls; but from expe-

rience I am led to think these curves may be the result of "drawing" by the backing and by the weight of the roof combined. The main front of St. George's Hall, Liverpool, is straight at the ground line; at the cornice it curves inward, from angle to angle, regularly and truly, and in a most beautiful and, if you like, "subtle" curve, having a verted line of some four inches. The angles cannot shrink. The central portion of the wall, being most free, shrinks most, and the inward draw is evenly and regularly modified up to the angles. I do not believe a straight cornice-line can be found in any building of any length and height, unless there are numerous inner and cross walls to counteract the shrinking and binding actions named. The walls at St. George's Hall were set out true, they were carried up truly, the shrinking and inward bending took place subsequently. I noticed it, and understood the reason; and in building the attic walls or courts which were added soon after Mr. Elmes left England, I backed the faced ashlar with pillars of ashlar in equal courses of Runcorn stone.

#### English Portrait-painting in the Seventeenth Century.

S. REDGRAVE.

The English painter had chiefly found his market in portraiture. He gratified the affections or flattered the vanity of his patrons. He painted the popular alderman full-robed and wigged, who, strutting in stiff dignity, garnished the company's hall; or the well-fed college don, bearing upon his broad shoulders all the learning of his college; or he painted for the family mantelpiece, no matter with how little art, a cherished remembrance, a possession dearer to those who for a short time surrounded it than the finest work of the greatest master. But in portraiture the English painters could get no further than the face. Such was the limit even to Samuel Cooper's great talent, and to Richardson's art on canvas. They were truly styled *face-painters*, and the practice then was to employ *drapery-men*, usually foreigners, to do the rest. These men's work was almost stencilled; there was no variety of background, no characteristic action or even distinctive costume; hands were rarely attempted, but when introduced were all of the same stamp. The story of a sitter who insisted upon having his hat on his head, instead of under his arm according to rule, and found when the portrait came home that in addition to the hat he wore to order, the customary one under the arm was not omitted, will require no verification to those who are conversant with the portraits of the period.

#### Anatomy for Artists.

ROBERT KNOX, M.D.

There is but one school of art—Nature. But to read her volume profitably artists must study profoundly the antique Greek and ancient Italian school formed by the era of Leonardo, Angelo, and Raphael. It may precede or follow or coincide with the study of the living figure; still these immortal works must be your guide. For whether it be composition or colouring or design, you are likely to find that these masters read Nature more clearly than you ever can. But do not copy or imitate them farther than as objects of study. Learn anatomy by all means, but do not forget its object. When you draw a dissected limb be sure to sketch the living one beside it, that you may at once contrast them and note the differences. In drawing from the nude figure, contrast your sketch with the antique; you will find in it many defects. Never forget that perfection, the result of a high specialisation of Nature's law of individuality is rare; the opposite, that is, imperfection, the result of a tendency to unity of organisation, is by far the more common. You will be chiefly called on to draw the draped figure; see that you place your drapery not on a machine, but on a person of fine feeling. Fashion in dress is the trick of society, to substitute a conventionalism for beauty and fine forms; never sacrifice art at its shrine, but paint the person in what becomes him or her, regardless of the existing mode. The relation anatomy holds to art is to explain, first, how far the shapes and figures of the inward structures modify the external forms of man and woman; second, it informs the artist of the meaning of such forms; third, it explains to him the laws of deformation, that is, of variety in external forms; the causes of these varieties, and the tendency to which they lead. As an artist he must represent them, no doubt; but in doing so, let him wisely follow Nature rather in her intentions than her forthcomings, and return to the perfect or to its approximation, whenever time and circumstances permit him to do so.

#### Stone Columns.

EATON HODGKINSON.

As long columns always give way first at the ends, showing that part to be weakest, we might economise the material by making the areas of the ends greater than that of the middle, increasing the strength from the middle both ways towards the ends. If the areas of the ends be the areas of the middle, as the strength of a short column is to that of a long one, we should have for a column whose height was twenty-four times

the breadth, the areas of the ends and middle as 13,769 to 9,595 nearly. This, however, would make the ends somewhat too strong, since the weakness of the long columns arises from their flexure. Another mode of increasing the strength would be that of preventing flexure, by increasing the dimensions of the middle. From the experiments it would appear that the Grecian columns, which seldom had their length more than about ten times the diameter, were nearly of the form capable of bearing the greatest weight when their shafts were uniform, and that columns tapering from the bottom to the top were only capable of bearing weights due to the smallest part of their section, though the larger end may serve to prevent lateral thrusts. This latter remark applies, too, to the Egyptian columns, the strength of the column being only that of the smallest part of the section.

#### Granite.

PROFESSOR NEWBERRY.

Granite is now used for several and quite different purposes. By far the larger part is employed for heavy and coarse masonry, docks, bridges, and foundations, while in many instances the superstructure of public buildings, and of the palaces that commerce erects, is composed of this material. The qualities of granite which fit it for such purposes—its strength and durability—are so marked as to give it superiority over every other stone in use. Good granite will bear a crushing force of from fifteen to twenty-five thousand pounds to the square inch, and the better varieties are among the most enduring of all rocks. In this respect, however, granites differ much among themselves. The constituents of granite are quartz, feldspar, hornblende, and mica, minerals of which the chemical composition and physical characters are very unlike. Mica is soft and fissile, and hence is an element of weakness. Where it exists in any considerable quantity the stone is easily crushed and unfit for use. The feldspars of granite are usually orthoclase (potash feldspar) or albite (soda feldspar), and of these the former is the most durable, but even this sometimes decomposes by the removal of its alkali, falling into a powder (kaolin); and it is not uncommon to find granite deeply disintegrated over wide areas by this sort of decay, which Dolomieu calls *la maladie du granite*. The strongest and most durable element in granite is quartz, and, as a general rule, the resistance which the stone offers to violence and time will be measured by the proportion of quartz to the other elements. The hornblende of granite is a tough and durable mineral. When present in large quantity it gives weight and tenacity to the stone. The best evidence on the question of the quality of granite is afforded by its resistance to crushing force, which should be 15,000 lbs. or more to the square inch, and its porosity, or power of absorbing water. An average granite contains or will hold about one per cent. of water, and if its absorbent power is much greater than this, it shows that it is liable to be affected by the action of frost. If practicable, the natural outcrops of granite should be examined with a view to determine its durability. Where the rock which has been exposed for ages is found to be sound and strong at the surface, this affords conclusive proof of its durability. In contrast with the many excellences which granite possesses it has one fault which should not be lost sight of, and that is, the readiness with which it is destroyed by fire. From the close texture of the stone it expands unequally when heated on the surface, and exfoliates, sometimes with explosion. In this respect it is inferior to brick, sandstone, or even marble.

#### Church Organs.

H. R. OLIVER.

This noble instrument, king in the realm of music, complicated as it now is, yet of easy control under the hands of experts, fertile in varied symphonious effects, giving with equal and satisfying success the gentlest and most sympathetic tones, as well as complete and sublimely-full utterances of musical inspiration, has a remote and continuous history. Originating in rude form in the earliest Christian centuries, it is referred to in a Greek epigram of the fourth century as "with reeds of a new species agitated by blasts of wind that rush from a leathern cavern beneath their roots, while a robust mortal, running with swift fingers over the concordant keys, makes them smoothly dance and emit harmonious sounds." The "hydraulic organ," or "water-pipe organ," into which, by some unknown method, the air was introduced by water pressure, gave way in the sixth century to the wind organ. This, with "its loud sounds produced from divers pipes," had movements made of wood, which, "pressed down by the fingers of the player, produce the most pleasing and brilliant tones." This not very lucid description evidently points to the organ in its elemental state. In the seventh century it found its way into the church, and becoming known in Western Europe, grew rapidly into favour and general church use, though having but few pipes and fewer keys, and requiring the united work of several men. It is matter of wonder that an instrument whose extraordinary capabilities have been so completely developed within the last few

centuries should have remained thus long in so imperfect a condition. Even in the twelfth century its compass did not extend beyond two octaves, half-notes being then first introduced: nor were registers, without which no variety of stops could be secured, introduced till the seventeenth century. Pedals had, however, been introduced before that period. From the Reformation to the reign of Charles I., but little mention of this instrument was made in England. During his reign prejudice ran so strongly against the use of any instruments as aids in church music that nearly all the organs in the kingdom were destroyed, and organists driven to other employments for support, a deep-seated hatred by the Puritans for all forms of worship of the Established Church running to such extremes that Government was petitioned "to put down all cathedral churches with their piping of organs, ringing of chime bells, and squeaking of chanting boys." At the Restoration a change took place; but, as expert organ-builders were not to be had in England, foreign artisans were summoned, the most celebrated being Bernard Schmidt, who restored the art and supplied many skilled workmen.

#### Consistency in Ornament.

J. K. COLLING.

In every design for ornament there should be a certain consistency running throughout the whole; if nature be departed from in one portion, it should never be too closely followed in another. As the arrangement is usually obliged to be conventional, so the leaves in which, if I may so describe it, the arrangement is clothed must also be conventional. We should take the spirit and feeling more than the literal form; the broad and general character, not the minute or insignificant. It should be arranged either in a geometrical manner or in graceful flowing lines, or in a manner combining the two. Nature may be sometimes seen to be very geometric and regular: the house-leek grows with extraordinary regularity; the flower of the woody nightshade is a perfect five-pointed star; the pentagonal form is very exact, again, in the flower of the major convolvulus; the cruciform character is prettily developed in the insignificant flower of the willow herb and in the common single-stock—the triangular in the lily and snowdrop, the leaflets of the clover, and oxalis or wood-sorrel—the symmetrical in the mistletoe, and may be seen again in the manner in which leaves grow round a stem. The maple grows with great regularity in a cruciform manner, and probably suggested the design of many a boss centuries ago. I have a distinct recollection at this moment of some beautiful maple-leaf bosses in the groining of the chapter-house of Wells Cathedral, which were arranged in this manner—four maple leaves issuing from the centre. In old examples we constantly find such arrangements, or others of a like nature, taken advantage of. Bosses upon the square, in the Perpendicular period, are very common; as also in diapers and finials of the Decorated period, where one series is made to alternate with the next, as foliage always grows in nature; in flowing lines, also, nature presents a wonderful variety.

#### Thickness of Arches.

CHARLES ELLET.

In some investigations on the equilibrium of arches, made many years ago, I deduced the following simple and convenient rule for determining the proper depth or thickness of the voussoirs of a cut stone arch at the crown. Let S represent the span of the arch, and T the thickness at the crown.

$$\text{Then } T = \frac{3}{8} \sqrt{S},$$

or, the depth of the voussoir at the crown will be three-eighths the square root of the span. This simple rule is applicable to all arches, however great or however small the span, from a semicircle to the flattest segments ever attempted on public works. It is always safe.

#### Aniline Colours.

PROFESSOR ODLING.

The usual course of production of the principal aniline colours is briefly as follows:—Rectified coal-tar naphtha, consisting mainly of benzol and toluol, is acted on by nitric acid so as to furnish commercial nitrobenzol. This highly oxidised compound is next reduced by means of iron-turnings and acetic acid into aniline. This reduced aniline is then oxidised, usually by means of arsenic acid, whereby crude aniline-red is produced, which is afterwards subjected to various processes of purification. Purified aniline-red is the crystalline salt—usually the acetate or hydrochloride—of a base known as rosaniline. The acetate of rosaniline, heated with aniline, is converted into phenylated rosaniline or aniline-blue. Rosaniline itself, heated with the iodide of ethyl or methyl, is converted into the ethylated or methylated rosanilines known as Hofmann's violets. And lastly, by combination of the base of the violet with more iodide of ethyl, or methyl, so as to form, for instance, a methyl-iodide of the fully methylated base, there is production of aniline-green.

## NOTES AND COMMENTS.

AN Art Supplement descriptive of the exhibition of the Royal Hibernian Academy has been published by the *Dublin University Review*, which is the new organ of the University—hitherto the silent sister among Academies. We are glad to see so much enterprise. The criticism is vigorous and independent. There are several illustrations of the Irish, French, and English pictures in the exhibition, which have been executed by Messrs. SPRAGUE'S ink-photo process in the course of a few days. They are remarkable examples of expeditious work. One of them suggests the tell-tale character of photography. It was remarked that in Mr. MILLAIS'S portrait of Mr. HOOK, R.A., the eyes were not of equal brightness. The plate reveals the oversight in a marked way.

THE last Fine Art and Industrial Exhibition at York has not been successful. The number of persons attending the summer exhibition was 20,916, and during the remainder of the year 3,126, making a total number of visitors of 24,042. The receipts during the year have been 1,252*l.* 2*s.* 6*d.*, and the expenses 1,615*l.* 4*s.* 10*d.*, showing a deficiency of 363*l.* 2*s.* 4*d.* The conversions from the loan fund to life membership has amounted to 225*l.*, and the Council commends this mode of helping the institution to the favourable consideration of the contributors to the loan fund. The Council regards with concern the deficiency in the annual income for the last two years; and whilst looking forward to the holding of another special exhibition as a means of placing the institution in a better financial position, it earnestly seeks the co-operation of the citizens generally by a more liberal patronage of its efforts, and especially by taking more largely its annual tickets.

THERE is commotion in the Paris art world about the issue of Baron ALPHONSE ROTHSCHILD'S candidature for the vacant seat in the Institute of Fine Arts. It will be said that the baron is not an artist. But it should be known that in addition to the sections of painting, sculpture, architecture, engraving and musical composition, which practically constitute the Institute, there is one which is supplementary, where the majority of members are amateurs, as will be seen from a list of their names:—The Duke d'AUMALE, Count de NIEUWERKERKE, Baron HAUSSMANN, Prince NAPOLEON, Marquis de CHENNEVIÈRES, M. EMILE PERRIN, M. BARBET DE GOUX, M. ALLBUT LENOIR, and M. GRUYER. It is to that section Baron ROTHSCHILD seeks admission, and as a patron of art he has a claim to a seat. But the voting is not restricted to the members of the section, and it is understood that since one of the painters, who is possessed of much influence, is opposed to the candidature on the ground that the Institute should be reserved to professional artists, the baron's election is problematical. In consequence of informality in the arrangements the election will not be held until the close of the month.

DR. RUSSELL has carried out two inquiries into the proportion of carbonic acid in the atmosphere, and into the composition of London rain, for the Meteorological Council of the Royal Society. The amount of carbonic acid in London air has been determined at intervals during the last two and a half years. The average amount of carbonic acid present in the air of the city is slightly below four parts in 10,000 of air, and this is shown to be rather less than that which has been found in the air of the few other towns which have been examined. Taking the most recent experiments on the composition of purely country air as indicating that the amount of carbonic acid is as low as three parts in 10,000, even then it seems that in the heart of London the average increase is not considerable. Further, the individual analyses show that the amount of carbonic acid is often considerably below this average, usually during bright sunny days. The smallest amount of this gas found was 3·3 parts in 10,000 of air, and this was on the Bank Holiday in August 1883, and as far as experiments have yet been made, the amount present on a Bank Holiday is always considerably below the

average. The second series of determinations relate to the amount of carbonic acid present during a fog, and show how much this gas increases under such circumstances. The average of these experiments is 7·2. The largest amount found was 14·1, and this was during a long continued fog in December 1882. The gradual increase of the gas on this occasion up to this amount is traced; and other cases are given where there has been a very large increase of carbonic acid. The rapid disappearance of the carbonic acid with the disappearance of fog is also shown. The increase and diminution of this gas it is pointed out must indicate the coincident variation of the amount of many other impurities in the air. The variation of the amount with the time of year is also shown in the report.

THE samples of rain were collected simultaneously at three stations: one in the city at St. Bartholomew's Hospital, one at Hamilton Terrace on the north-west, and one at Hackney on the north-east of London. The collecting of samples was commenced in the autumn of 1882, and has been carried on to the present time. The amount of sulphates and chlorides in the rain has been determined, and it appears that on taking the average of each set of experiments, the rain collected in the city contains twice as much impurity as that in the suburbs. This impurity is essentially of the same kind in all cases. The samples collected at different times are shown to vary very considerably in composition; but, as a rule, the variations are not local, but extend over the whole district examined. It is seen from the analyses given to what a great extent rain acts as a purifier of the atmosphere. The analyses made up to the present time indicate that a greater amount of sulphates are present in the summer rain than in winter rain. This apparently indicates that to a large extent the sulphates come from the decay of animal and vegetable matter, and not merely from combustion of coal. The composition of London rain is also compared with that of the country. The rain collected in the city appears to be never acid; but if rain be collected in open vessels which are left exposed for some length of time to the air, it will then be found to be acid. This arises from soot collecting in such rain-water. It is further shown that the moisture in air condensed by application of cold contains impurities similar to those in rain, and that this method may be of service in examining the purity of air.

THE Court of Common Council have approved of the proposal to erect the Guildhall School of Music on the Victoria Embankment, near the City of London School. The site, which contains 8,000 feet superficial, at present belongs to the Metropolitan Board of Works, but it can be obtained on a 99 years' lease, at a ground-rent of 1,100*l.* per annum, and on the expiration of the lease it reverts to the Corporation. The outlay on the building will therefore be for the improvement of City property. Mr. HORACE JONES has estimated the cost of the school at 19,500*l.* It will comprise thirty-eight class-rooms (or double the number now used), organ-room, library, large practice-room, eight sets of lavatories, eight waiting and retiring-rooms, six rooms for principal and secretary's offices, with residential rooms for the secretary. The Guildhall School, under Mr. WEIST HILL'S direction, has been most successful, and the Corporation have reason to be proud of their work. In more commodious premises—where over four thousand pupils can be taught—it should do much towards making music a civic accomplishment.

M. ERNEST GOVIN, who was one of the leading contractors in France, died in Paris on March 24. During forty years he was connected with many of the largest undertakings on the Continent. After leaving the Polytechnic School, he was employed on the works of the railways between Paris and St. Germain. He constructed several bridges in France, Italy, and Austria, among others the large one in Pesth. In Russia he had one of the contracts on the line between St. Petersburg and Warsaw. M. GOVIN was a director of the Bank of France, and had been president of the Tribunal of Commerce. He held the rank of commander in the Legion of Honour.

## ILLUSTRATIONS.

## EPSOM INFIRMARY.

THE illustration of the Epsom Infirmary shows the new building recently erected in connection with the workhouse on the east side of the ground. The general disposition of the plan is as follows.

The male block is placed to the north, running east and west. The ground-floor contains two wards of 16 beds, each separated at pleasure by sliding doors. The building containing the water-closets, bath, and sink is separated from the wards by a passage with cross ventilation. Nurses' rooms and pantry are attached to these wards. Separated from these wards by the staircase is the day-room, with lobby and separate water-closet and urinal. The two wards beyond are for special cases, and are completely cut off from the other wards, and are provided with distinct airing-grounds. The first-floor plan extends as far as the day-room, and has two wards of 16 beds each, and a separate ward of 4 beds. The administrative block contains kitchen, doctor's-room, accident-room, and two receiving-rooms.

The south block contains on the ground-floor one ward of 10 beds for aged women, lying-in ward of 6 beds, and labour ward for 2 beds, day-room, separation ward for 4 beds, and two wards of 4 beds each for special cases. The first floor has one ward of 16 beds, one of 6 beds, and a separation ward of 4 beds. The wards are heated by POTTER'S thermhydic stoves, the latrines being heated by hot water.

The buildings are faced with CHUTER'S red bricks, and slated with Metz slates. The hot-water arrangements were by Mr. HARDS. The sanitary plumbing was executed by Messrs. TYLER, of Newgate Street, London, E.C. The total cost of the work was 9,888/. The builder was Mr. HUMPHRIS, of Sutton; the clerk of the works, Mr. COLEMAN. The work has been carried out from the designs of Mr. HERBERT D. APPLETON, A.R.I.B.A., of 157 Wool Exchange, Coleman Street, London, E.C.

## REFERENCE TO NUMBERS ON PLAN.

## WORKMEN'S DWELLINGS, GLENGALL ROAD, S.E.

MESSRS. CHUBB & SON'S Lock and Safe Company (Limited) have recently added to their works at Glengall Road, S.E., a block of dwellings for their workmen, on a portion of the site of their lock and safe factory. The ground floor is occupied by a coffee-room, accommodating 250 workmen, and available for entertainments and lectures, a reading-room, kitchen, &c. The three floors above consist of tenement dwellings, so grouped that they can be combined without alteration into two-roomed, three-roomed, and four-roomed tenements, according to the varying requirements of the tenants. A laundry is provided on each floor, and the flat roof forms a drying-ground. Each tenement is furnished with coal-bin, cupboard, and cooking-range, and each tenant will have access to a garden which adjoins the building. The works have been carried out by Mr.

EDWARDS, of Kentish Town, from designs by Mr. E. HOOLE, F.R.I.B.A., of 104 Great Russell Street, W.C., the architect of Messrs. CHUBB'S factory. The buildings will shortly be opened by the Right Hon. the Earl of SHAFTESBURY, K.G.

## NEW PREMISES, PARADE AND EDWARD STREET, BIRMINGHAM.

THIS illustration represents a block of business premises now approaching completion at the corner of the Parade and Edward Street, consisting of seven shops, with large stores in the basement and dwelling-rooms over. The shop fronts are of wood, and the upper storeys of red brick with stone dressings, and the roofs covered with brown tiles.

The work is being carried out for Mr. THOS. GOUGH, from the designs of Mr. OLIVER ESSEX, A.R.I.B.A., of Paradise Street, Birmingham, at a cost of about 4,000/.

## THE ARCHITECTURAL ASSOCIATION.

AT the ordinary meeting of the Association held on Friday evening, March 20, Mr. Cole A. Adams, president, in the chair, Mr. F. L. Penrose, M.A., gave a lecture on

**Proportion in Architecture, Especially as Exemplified in the Works of the Greeks.**

Mr. PENROSE, in his remarks, spoke of proportion in architecture being twofold in nature. First, in the adaptation to meet the requirements of building and providing a proper support for the mass to be borne, beauty and gracefulness were not necessarily concomitants. In the second place, there was proportion that resulted in beauty, the outcome of a certain artistic sense of feeling which, consciously or unconsciously, was nearly always combined with rhythmical proportion. A knowledge of certain rules, however, might be serviceable in enabling the results to be obtained more readily, and the Greek buildings would be found to illustrate these rules or methods of proportion. The Doric school of architecture had been influenced by the acquaintance with the Egyptian architecture along the banks of the Nile. The Ionians had been influenced by the Phœnicians, whose work had been recognised by King Solomon in building the Temple. The Doric proportion was one of strength and masculinity; the Ionic, on the other hand, was one of elegance and femininity. Mr. Penrose then described the Acropolis at Athens, with its buildings and temples, as also the Parthenon, Propylæa, and Erechtheum, and referred to the proportion of the column and the entablature. At the Erechtheum this proportion was seen at its best, as the entablature showed solidity without being too heavy, though if it had been on Doric instead of Ionic columns the columns would have been overweighted. The Doric as it was developed tended to become more and more slender, till they passed the margin of safety in strength, when the Doric order was superseded by the Ionic and the Corinthian. The Erechtheum also illustrated in its other features fitness for the purpose intended. The plan of the building, in its regularity or irregularity, had been governed by the necessities of the site, and showed that, however strict and rigid the Greeks were in regard of symmetry, when circumstances required it they allowed themselves the greatest freedom, and so secured the best results. Speaking of the Greek mouldings, Mr. Penrose observed that they were invariably formed on the proportions of the conic sections, though the circle was rarely used. There was the ellipse or oval; the parabola, an infinitely prolonged ellipse, the lines of which always tended towards but never became parallel; and the hyperbola. The ellipse was much used by the Greeks for egg and tongue mouldings, the parabola generally for the sections of cornices, while the hyperbola was a favourite curve because of the wonderful effects of light and shade produced by its use. The Doric capital was a portion of an hyperbola, so that the curve always tended to get straighter and straighter, and caught the light in a most wonderful way. A pale atmosphere did not bring it out in the same wonderful way; but in bright sunlight the most exquisite effects of light and shade were got by almost insensible degrees. There was plenty of room for contrasts of light and shadow, and there were the most exquisite gradations, as also broad expanses of light with small shadow, or, inversely, much shadow and a small amount of light. When the Greeks used contrasted curves they did not use such curves as the Romans did—circles butting against each other—but they used either the hyperbola or the parabola, which became straight at the point of contact and then curved outwards. Mr. Penrose then described Professor Donaldson's table of Greek mouldings, and showed the description of curve that ran through all, the circle being hardly used at all; and he also explained how with the delicate curvature the subtle effects of

light and shade were produced. The Ionic volute was then considered, as also its origin in the very early Ionic work, which was characterised by scrollwork of the same description as that on the very early examples found at Mycenæ by Dr Schliemann, as well as in Asiatic Persepolis. This indicated the connection between Phœnician and Ionic work that found its development in the Ionic volute. The Roman volute was but a weak representation of the Ionic volute. Vitruvius gave a rule used in his time for drawing the Ionic volute, and much interest had been taken at various times to work the matter out, but none of the results hit off the volute exactly. There was a want of continuity seen which was entirely absent in the Ionic volute itself. Mr. Penrose said he had been led by a contemplation of the difficulty to offer an explanation, as also by the fact that in the volutes at the Erechtheum, a hollow eye was found in the centre, and this hollow eye was afterwards filled in by a boss. The meaning of it was to allow of placing a little instrument in the eye, which admitted of the curve being drawn by means of a string. The adoption of curves from the conic sections showed that the Greek architects were keeping abreast with the advance of science, in the days when the conic sections and their geometric properties were engaging the attention of mathematicians. Mr. Penrose then referred to rhythmical proportions, observing that no true result was obtained without them. The plans of the temples in their internal proportions and the external, which were the leading proportions, were all verified on a rhythmical scale. On the question of the Greek optical refinements, the treatment of the pediment was referred to, and Mr. Penrose showed that any straight line was affected by the proximity of other straight lines. When a second line was drawn, an effect of bulginess was produced in the centre. This was rectified by using oblique lines, which created an appearance of straightness. The Greeks discovered this effect, and used a certain amount of curvature to vertical as well as horizontal lines. With perfectly straight lines a column would look weak and impoverished in the middle of the shaft. The curvature applied was extremely delicate; a curve of such a nature could only be derived from the hyperbola. Mr. Penrose concluded by showing how the Greeks refined their vertical and horizontal lines, and mentioned several instances where the horizontal lines were to be found cambered.

### THE BALNEOGRAPH.

THERE are two styles of painting in water-colours, or even three styles, if we reckon the oldest method of all, where the drawing was completed in Indian ink and the colours washed over it, a system we can hardly call water-colour painting at all. The oldest system which can rank as an art of water-colour painting is that practised by Copley Fielding. It consisted in a superposition of washes. We have it from Fielding's niece, that her uncle never used a colour, but only washes of dirty water; by this means he obtained the extreme refinement of his skies and distant grounds. The fault of this system was that it led on to painting conventionally; it excluded completely any attempt at jotting down a portrait of nature—a true effect of colour, or light and shade—and, although it has had such eminent practitioners as Copley Fielding, it is a system of water-colour painting which is completely exploded, nearly as much so as the Indian ink shades and superimposed washes of Paul Sandy. The modern water-colour painter dashes on the exact tone of colour at once on his paper, and never touches it afterwards; by this means he obtains a brilliancy and life unknown to the elder masters. But it is a system that only the most clever hand and the most practised eye can use. The handling must not only be exact, but done with the utmost rapidity, for the tints of colour dry rapidly, and offer hard edges if they do, so that not only the beginner but also even able amateurs are condemned to the production of nothing but daubs. There is no master's help possible, no amending of faults and turning of the tyro's work into a sightable drawing for the gratification of papa and mamma; but what is worse, it is a question whether painting can be studied at all through the medium of water-colours, for study means at least deliberation, and no study is possible if the execution of the work must be done without sufficient time to think. This inconvenience, at least, the pupil need no more fear, thanks to the balneograph, a recent invention of Mr. Stephen Clift, an artist who practised successfully both in England and abroad. The balneograph keeps the paper on which we paint always damp, and so effectively that the author has sometimes left his drawing in the middle of some delicate sky, for a few hours, and then gone on with it without any trouble. We can now deliberate and think at ease, and although the colour once down must remain, there is no obstacle to our studying nature with the utmost care. To our mind, no more important invention in art processes has been made for a long time, and we are not surprised at the support it secures from such distinguished artists as Messrs. A. W. Hunt,

McNeil Whistler, Collingwood Smith, Ernest A. Waterlow, John White, Nathaniel E. Green, and Nicholas Chevalier, who all strongly recommend the invention.

### THE BIRMINGHAM ART GALLERY.

THE Museum and School of Art Committee of the Birmingham Corporation in their report state that the new Museum and Art Gallery Building is in a very forward state; the tiles are laid in galleries Nos. 5 and 6, and are being laid in the remaining galleries; the plastering is completed, and the plasterers and carvers are now at work in the entrance-hall and vestibule. The glazing and fixing of the sunlights for the artificial lighting will shortly be proceeded with. Mr. Whitworth Wallis, the keeper, commenced his duties on the 1st of January last, and the committee have, up to the present, appointed a clerk, a foreman, and a carpenter to assist him in the arrangement of the collections. Under his superintendence the examples of Florentine and Venetian stone and marble work comprised in the Robinson purchase have been removed into the Art Gallery, and are now being arranged and permanently fixed. The keeper has also prepared a register and catalogue of the whole of the collections in charge of the committee, numbering upwards of 9,000 objects, and has drawn out plans of the proposed arrangement of the cases in the new Art Gallery, where the collections will be at once transferred on the completion of the building. The committee have carefully considered the subject of the cases required for the exhibition of the various collections, including the Tangye collection of Wedgwood ware, on the opening of the galleries, and they find that thirty-two standing cases and twenty wall cases will be necessary, in addition to those already belonging to the Corporation, and available for use. They have, therefore, prepared specifications and drawings of the cases, and have invited tenders from the following firms:—The Midland Joinery Company, Birmingham; Messrs. Barnsley & Sons, Birmingham; Messrs. W. & J. Webb, Birmingham; Messrs. Holland & Sons, London; Messrs. Frederick Sage & Co., London; Messrs. Drew & Cadman, London. The lowest tender is that of Messrs. Holland & Sons for the sum of 1,542*l.*, and as this firm are the makers for the South Kensington Museum and the other national institutions, and therefore specially qualified for the work, the committee have accepted their tender, subject to confirmation by the Council. Some additional fittings will be necessary to complete the galleries, and the committee have them under consideration. They are, however, at present unable to give details of what will be required, but they estimate the cost at 758*l.*, which sum, together with the amounts previously specified, makes up a total of 2,300*l.*, being the amount of the committee's estimate of its expenditure on capital account for the current year. They therefore recommend that they be authorised to expend the sum of 758*l.* in completing the internal fittings of the Museum and Art Gallery, and that the Finance Committee be instructed to borrow, in accordance with the provisions of the statutes in that behalf, the sum of 2,300*l.*, being the amount required by the committee for the before-mentioned purposes. Rapid and satisfactory progress is being made with the School of Art. The greater part of the windows are glazed, the skylights are all glazed and the frames painted, and the plastering is nearly completed. The warming apparatus is fixed, the staircases are being put in, and the concrete for the floors and corridors is already down.

### COLOUR ON THE EXTERIOR OF BUILDINGS.\*

THE recent Healtheries Exhibition at South Kensington, where many novelties used in the construction and fitting-up of buildings have been on view, has, among other things, given rise to much interesting discussion turning upon the use of material, judged more particularly from its sanitary or unsanitary characteristics. One or two of the reformers, noted equally for their artistic ability, as well as for their knowledge of practical questions affecting the well-being of the community at large, in their crusade against dirt and dust, in which abound so many germs of disease, recommend very highly the use of facing materials, which are readily cleansed. Granite, marbles, and the like, which are capable of receiving a high polish are commended, but they draw attention more especially to materials having a glazed surface, such as enamelled bricks, tiles, and the new constructional faience made at Burmantofts and Lambeth. None of these materials lose their colour, and if kept clean in a systematic manner not dependent on an occasional shower of rain, they preserve a bright glittering appearance, which is attractive on account of its cleanliness.

\* From a paper by Mr. W. H. Thorp, read before the Leeds and Yorkshire Architectural Society.

The very greatest care, however, must be taken to avoid anything loud or garish in colour that would be out of harmony with the surroundings of the buildings, where this class of material is adopted. All might be well if we had not the British climate to contend against with its 'drizzling mists and yellow fogs charged with impurities, which, in our large towns, leave their grimy deposits upon everything they come in contact with. At present it would seem as if we must take things as they are, as there appears to be almost as little hope of the smoke and other impurities existing in large centres of population being improved away, as there is of our fickle climate changing from its usual humid conditions to one of dryness and sunshine.

The chief plea urged in favour of the use of these polished and glazed materials being that they impart colour to our thoroughfares, and their capacity for being cleansed, it will only be by reason of the scheme of colour being simple and appropriate to its position, and of the wall surfaces receiving their periodical washings and scrubbing, that they will meet with approval, and so come in for general adoption. What can look worse than a decorative piece of outside work coated with grime, its colour dimmed, with here and there a bright streak, where the rain has streamed down its surface?

Twenty years ago when Gothic of the Venetian palace type was all the rage, there were numerous buildings erected in London and elsewhere, in which polished slabs of marble were largely used for interior work, and relied upon for decorative effect; and, in some instances, pictorial treatment in glass mosaic was introduced. When new doubtless they looked pretty, and this sort of thing being a novelty in England found many admirers. But what can be said for them now that they have stood the test of two decades, exposed to the changes of our inhospitable climate, combined with the impurities with which the atmosphere is charged, which have been already alluded to? Little in their favour it must be confessed. What may be appropriate for Italy has not been found suitable for England. In the pure atmosphere and bright sunshine of the south, marbles and gay-coloured materials may be used with admirable effect, but not so in England. Our English climate demands of us a different kind of colour, and I think, conceived in a lower key.

In my opinion, in the colour of our buildings we do not want anything startling—no southern exotics foreign to our native soil, but something warm and mellow in effect, so as to contrast with the cold, grey, misty tones which habitually prevail in this country during eight months out of the twelve. And materials that contain just the right amount of colour may be had in abundance all over the land. Have we not building stones in a large variety of subdued colourings in various shades of yellow, brown, grey, and red? And in brick and terra-cotta, which are durable, and instead of rapidly deteriorating in appearance, are rather improved by exposure to the atmosphere than otherwise, can we not obtain an infinite diversity of tints, most of them warm and mellow in tone, and capable of imparting a cheerful appearance to the buildings in which they are used? In roof-coverings the mountains of Westmoreland, Cumberland, and Wales provide us with slates in large quantities in shades of grey, purple, and green, while the potteries in Staffordshire in their turn supply us with roofing tiles in reds, russets, and browns.

The homely buildings common to many of our country villages may often teach us a useful lesson in colour composition. In Worcestershire and Herefordshire there is many an old homestead in which is to be seen a picturesquely-grouped building with a good skyline. The lower part may be built of brick of a warm deep red, its original brightness toned down with age and exposure to the elements; the upper storey is probably timber, framed with here and there a gable or dormer with mullioned latticed windows; the framing a rich dark-brown, which contrasts admirably with the creamy tints of the parqueting, and the roof covered with red tiles, the ruddy hue varied here and there with clumps of house-leek, yellow lichen, and weather stains. These in colour are everything that could be wished for; and almost equally appropriate, and, as it were, indigenous to the soil, are many of the warm-tinted, stone-built houses common to many parts of Yorkshire. These do not startle you with any vivid contrasts in colour. On the contrary, they are sober in hue, studies in monochrome, the range of colour being to a large extent in the same key, and only comprising a few shades of drab, brown, and russet. Yet, in spite of their simplicity, they succeed in satisfying the eye trained to appreciate the subtle harmonies of colour.

Most of these habitations are roofed in with stone, technically known as grey slates, obtained from a species of laminated flagstone, whose lines of cleavage are somewhat similar to those of slate. A pleasant variety of colour is oftentimes imparted to these slates by the presence of peroxide of iron, and the mica produces a silvery appearance when exposed to the rays of the sun.

Whilst upon the subject of roof-coverings, I should like to ask you to avoid a Welsh slate of a certain purple-red tint,

which hardly ever looks well, and should never be used where a pleasing effect in colour is wished for.

The fashion of using two or three varieties of colouring in the slating of a roof, and arranging the slates in geometric designs, emphasised by the difference of the tint, has had its day, and we happily do not now see so many examples of it as we did formerly. The beauty of a roof, to my mind, consists in its grouping, and in a certain breadth of effect which is entirely destroyed by laying out parti-coloured Chinese puzzles upon its sloping faces. There are several precedents for this mode of treatment in old work, but these should not prevent us from exercising a wise discretion by adopting it but rarely.

In ancient buildings, examples not only of coloured patterned arrangements in slates are to be met with, but the practice also applied to tile-roof coverings. This mode of treatment was more common abroad than at home, and examples of the latter may be seen in Dijon, the ancient capital of Burgundy, where may be observed many schemes of vivid colouring in the roofs, in which the startling effect is enhanced by the use of glazed tiles for the more pronounced features of the design.

One case in point is recalled to my mind—that of the Hôtel de Vogüé, which in many respects is one of the most interesting types of early French Renaissance of the time of Francis I. there is now remaining. But if these geometric arrangements do not meet with much commendation from me, do let me request you to give more thought to your roof coverings than is usually bestowed upon them, for their colour alone often plays an important part in the general effect of a building, and I have seen houses of little interest redeemed from the commonplace by attention to this little matter of detail.

At the risk of wearying you I cannot leave the topic of slates without referring to the excellent effects obtained by the use of this material which are to be met with in Belgium and Germany, and are especially noticeable on the banks of the Meuse, Moselle, and Rhine. As a usual thing the tail-pieces of the slates are rounded, and instead of being arranged in horizontal courses they are put on so as to form a slight angle with the eaves, and have an appearance akin to that of the scale of a fish. Many of the gable ends are slate hung, instead of hung with tiles as is more common with us, and bands of scale-patterned slates, alternating with surfaces of plain horizontal ones, give a slight variation in colour—another shade of the same tint which is gratifying to the eye. In the autumn of 1883, in walking along the banks of the Meuse between Namur and Dinant, the many ways in which slate is there turned to account was forced upon my attention, and in nearly every little hamlet passed through I noticed some quaint turret or *flèche* distinguishing the church from its environment of houses, slated merely, but forming nevertheless, with its harmony of silvery-greys and greens, a study for the artist.

Although brick may seem a commonplace material upon which to descant in these pages, it is, if handled in a masterly manner, capable of great things. If there is one place more than another that I can think of which satisfies the eye for colour it is Bruges; and yet this effect is produced by the simplest means, the brick of which most of the buildings are constructed being the chief element. The Belgian climate is very similar to our own, and the result is by no means dependent upon such adventitious aids as the brilliant sunshine and blue skies of Southern Europe. But what brick it is, and in what an infinite variety of colourings, from tawny yellows, low-toned reds to deep Indian reds, crimsons, russets, and purply-browns; and how admirably it contrasts with the colour of the roofs and the pellucid greys and greens of the canals from which so many of the buildings rise, which bathe their feet and cover their walls with mossy verdure! Yes, brick and its handmaid, terra-cotta, may do us much service in giving us a warm sense of colour in our thoroughfares, and it is a subject for congratulation that the reign of *compo* and *stucco*, if not quite ended, is lingering out its latter days.

In cases where stone and brickwork are used together there is still room for improvement in the way in which the materials are handled and the colour distributed. They seem to manage this combination of the two better in the Low Countries than we do at home, as may be seen, for example, in the town halls of Haarlem, Leyden, Veere, and Middleburg; and in ancient buildings it was a common practice to emphasise their façades by introducing horizontal courses of stone in conjunction with the brick facework. Specimens of this mode of treatment are common all over the Netherlands and Flanders, and it will suffice to name one familiar example—the old Boucheries at Antwerp. Where age has toned down the rather vivid contrasts between the red and the colour of the stone, the effect is rather agreeable than otherwise; but when new, the appearance, if piquant, is too startling. In modern work a building treated in this manner, with the colour distributed in the same happy way as of old, would be an agreeable variety amongst others of a quieter type, and one or two of our leading architects have not hesitated to adopt it in some of their recent masterly compositions.

In the outside painting of woodwork and ironwork there is

still considerable room for improvement. "Self oak" for woodwork and a strong obtrusive Prussian green for ironwork still hold the mastery, and it is only occasionally that we find these colours deviated from. In the case of buildings erected of stone it is my practice, as a usual thing, to have the principal outside work, such as doors, gates, window-frames, and timbers in the gables, painted an umber-brown, which I sometimes vary with an olive tinge, and, if the building is in the country, to have the sashes painted cream or vellum colour, which contrasts well with the brown, and generally succeeds in brightening up the design. A good olive-russet, or a particular shade of madder, with a purple tinge approaching plum-colour, may, by way of variety, take the place of the umber brown, and the result should be successful.

Where brick is used (and so-called "Queen Anne" houses, built of red brick and tile, are still the fashion), many people prefer to have the whole of the woodwork painted vellum-white; but, personally, although I use this colour for the window-sashes, I prefer a stronger colour for the main features of the woodwork. There is a certain shade of greyish blue-green which contrasts admirably with the masses of brickwork, and helps to neutralise the reds, which is preferable to the mode first described, and if cream or ivory white is used for coved cement cornices or outside parquetry work, the balance of colour is preserved.

For iron gates and palisades, dark Indian reds and chocolate browns, olives, and steel-blue greys are admissible and appropriate.

### THE USE OF GAS FOR HEATING.

A SPECIAL committee was lately appointed by the Town Council of Glasgow to consider the subject of the utilisation of gas for heating and cooking. A report was prepared, from which we take the following:—The substance of the information the committee have been able to obtain, by correspondence and personal inquiry in other towns, is as follows:—A few years ago an experiment was made by some of the English corporations in hiring out gas cooking and heating stoves. The principle of this experiment was simply an extension of the system of supplying meters to consumers, and charging an annual rent for their use. It was considered of special importance to develop a demand for gas during the summer season and during the day, when the gasworks, with the permanent staff, were only partially employed. Every thousand feet of gas sold in this way yielded a far larger proportionate gain than the gas sold for lighting, as it costs practically nothing either for permanent works, permanent staff, distribution, or collection of rent. It was thus a most important source of increased revenue, and gas companies and corporations were willing to supply stoves at such a hire as would simply pay for interest on capital, upkeep, deterioration, and management, looking for their profit to the increased sale of gas. This system seemed to supply the one thing needed for the popularisation of gas for domestic use. The experiment was a success, immediate and complete. Thousands of consumers who would never venture upon the (to them) doubtful experiment of buying a gas stove are easily induced to hire, at a small rent, a cooking stove or heater as a convenient auxiliary to their permanent conveniences. They seldom return them. Their convenience is such that, once used, they cannot be dispensed with. They are found to be perfectly adapted for cooking—cleanly, convenient, time-saving, economical—and give universal satisfaction to the public. A success so pronounced was certain of universal imitation, and the hiring system has now been adopted by nearly every town, large and small, in England and Scotland, Glasgow, to the astonishment of all who know her as a progressive city, being a notable exception. Inverness, Elgin, Forres, Aberdeen, Brechin, Coatbridge, Dumfries, and many other Scotch towns, have adopted it successfully. Dundee has disposed of 1,200 stoves; Leicester has 2,100 out on hire, and 500 owned by consumers; Hull has over 2,000 stoves hired out. The Gaslight and Coke Company, London, have 4,000 stoves hired out, and probably 1,600 owned by consumers. They are hiring them out now at the rate of 40s. a week. The South Metropolitan Gas Company have out 2,500 stoves on hire, and a large number in hands of private consumers. Your sub-committee have been unable to see anything in the circumstances of Glasgow to warrant them in supposing that a system so successful and satisfactory elsewhere would not be quite as suitable for adoption here.

We are aware that various objections of a general kind will present themselves to the Gas Committee. The first is that the Corporation have already more than enough work to do, and should not add to their responsibility unless under urgent necessity. We have already shown that, in our opinion, this extension of the gas department is a proper and legitimate part of the Corporation work, and, if so, should on that account be taken on hand, whatever might be its difficulty. But we would

also add that the only really difficult work is in organising the department. In actual working the difficulties are *nil*, as the details are mostly of a kind that can be without trouble amalgamated with the regular routine. If a committee be appointed to organise the system, along with the general manager and the treasurer, the work will be afterwards but a very trifling addition to the duties of the Works Committee. Another objection that may be urged is that the Corporation are interfering with private enterprise. This, if true, might be a sound objection. But, in the first place, we contend that the public interest is the supreme consideration for the Gas Committee, and in the next that this movement would not be an interference with, but a great stimulus and help to private enterprise. It would greatly encourage the local manufacturers of gas apparatus, and cause at the same time such a general awakening in the public mind to gas-consuming conveniences that a greatly increased trade would spring up throughout the city for gas appliances and suitable cooking utensils, and other articles connected therewith. We have made the most careful and exhaustive inquiry on this head, being well aware that this is a point on which your minds would be specially sensitive, and we find that in all cases the result has been as we have stated. The first feeling of the local tradesmen has very generally been one of alarm, but their experience in the end has been that, instead of being injured, they have been benefited. Another objection that may be raised is that Glasgow gas is too good and too dear. Probably the best reply to this objection is that Scotch towns, such as Dundee, Aberdeen, Dumfries, &c., supplying gas of equal quality and price, have successfully introduced the hiring of gas stoves. The sub-committee have also ascertained from makers of gas stoves that there is no difficulty whatever in adapting the stoves to burn any quality of gas; and that the richer the gas the less is the quantity required to do the same amount of work. All experience goes to show that this objection has no force. The sub-committee considered it absolutely necessary, before reporting on a matter of this importance, that they should make an exhaustive and complete inquiry into the whole system as carried out in other places. We therefore addressed letters of inquiry to the following:—British Gas Company, Hull; South Shields Gas Company; Darlington; Scarborough; Dumfries; Aberdeen; Inverness; Elgin; Forres. Several of the members of the sub-committee, accompanied by Mr. Foulis, visited the following towns and establishments therein, viz.:—London, Birmingham, Leicester, and Dundee. Details are given of the information in this way collected, and the report proceeds:—"Most of the corporations exhibit and sell a large variety of gas appliances not suitable for hiring. This is adopted solely with the view of educating the consumers and spreading a demand for the various kinds of gas apparatus, and, as the price fixed is generally the ordinary retail trade price, the articles are simply supplied for the convenience and at the request of the public. The general charge for hire is 10 to 15 per cent. per annum on the cost price, collected quarterly, along with the gas accounts. The sub-committee are of opinion that, if action is to be taken in the matter by the Glasgow Gas Committee and the Town Council, it should be taken promptly and effectively. The months of May and June are the months in which householders are most disposed to make a beginning in gas cooking. They therefore recommend:—1. That the Gas Committee resolve to adopt the system of hiring-out cooking and heating stoves, &c., on the general lines already adopted by the corporations in England and Scotland, but modified and adapted to local circumstances as may seem advisable. 2. That a variety of approved gas appliances be exhibited, and (if desired) supplied to the gas consumers at the ordinary trade price. 3. That a committee be appointed, along with Mr. Foulis and Mr. Ross, to organise the department, and to make all arrangements necessary for the successful commencement of the system."

## Bygones.

"Antiquity after a time has the grace of novelty."—HAZLITT.

### SURVEYORS' PRACTICE FIFTY YEARS SINCE.

THE following representation of the practice of building surveyors in the days before the Institute of Architects was founded suggests a state of things that happily may be numbered among "bygones." It will suggest some of the reasons which induced the founders of the Institute to lay down a line of demarcation between surveying and architectural work:—

The first thing I shall notice is that disgraceful mode of giving evidence in courts of justice, which has made the very

name of a surveyor a laughing-stock for the legal profession. His evidence in a court of law is looked upon in the same light as that of a horse-jockey in a horse cause; and can we be surprised at it, when similar evidence to the following is constantly given?

Plaintiff A and defendant B are at issue upon an account for works executed. The witnesses of A state that the work is done in a very superior manner: one witness swears that the work is fairly worth 1,544*l.*; and another witness, to support him, swears the fair value is 1,630*l.* Then come the defendant's witnesses, who state that the work is very badly executed, and done in a very improper manner: one of them asserts that the outside value of the plaintiff's work is 930*l.*, and another surveyor says he makes the value 935*l.* Now, what are the judge and jury, who know no more about a building account than a boy of seven years old, to do in such a case? They are surprised and astonished that respectable men can be so very wide in their values; and what is the result? Why, they take the several amounts as given in evidence, add them together, and divide the amount by the number of witnesses; accordingly the result in the above case would be that a verdict would be given for 1,257*l.* Now, let architects and surveyors reflect upon this disgraceful mode of giving evidence (and they know too well that what I have stated is pretty near the truth), and ask themselves whether it is not time that something should be done to redeem the character of their profession?

Again, do we not find it frequently the case that gentlemen have such an antipathy to the name of a surveyor, that, if the builder were to mention to his employer that he was about to engage a surveyor to measure the works executed, he would immediately give offence? consequently, the builder is obliged to introduce the surveyor into the building by stealth. Nor can any one be surprised at it when we witness the extortionate charges made by some surveyors, whom I shall here style custom surveyors. This is the manner in which they proceed. Two surveyors meet to make out an account of certain works done. We will suppose the account that they have to settle is a plumber's bill. The first article is 18 cwt. of milled lead: the plumber's surveyor requires 25*s.* per cwt.; the surveyor for the opposite party remonstrates, and points out to him that the prime cost was 15*s.*; the other replies that 25*s.* is the customary price, and that he cannot take less. To convince his opponent he opens an old measuring-book, and shows that 25*s.* has been charged in an account that he settled on behalf of Mr. Getall with Mr. Easy the surveyor some years before, and he again repeats that it is the custom to charge 25*s.*, and that he cannot deviate from it. In the same way he charges 1*s.* per foot for pipe that only cost 4*d.*, and 1*s.* per lb. for solder that only cost 5*d.*; and so he goes on in the same ratio with all other articles in the bill. After charging so extortionately for the time and materials for making a joint to a pipe, he has the conscience to ask, in addition, 2*s.* 6*d.* for that joint, though he cannot tell why he does so, except that it is the custom, &c. The consequence of all this is, that the surveyor for the opposite party, if he have any conscience, cannot settle the account, and it is referred to the lawyers; it is then carried into a court of justice, where it is decided in a similar manner to that which I have before described.

Can it be a matter of surprise that there should be so little measuring, when the charges are made out in the way I have stated? As a remedy, I would recommend every person intending to build to have the work done by contract. I would contract even for a dog-kennel, until these custom surveyors are brought to their senses. This, I think, they soon will be; for, in consequence of the manner of proceeding which I have described, they are employed less and less every day.

Another great error in valuing builders' work is that the surveyors too frequently charge but one price, whether the work be done well or ill, and that they pay no regard to the prime cost or to the mode of payment. The latter ought to be taken into serious consideration, for, if the work be paid for as it proceeds, it will enable the builder to purchase his materials with cash, and thus generally 10 per cent. cheaper in the market than if he had to obtain them on credit. On the other hand, if the work be not paid for till some time after it is finished, a considerable increase ought to be allowed for the disadvantages of being obliged to purchase on credit, and for the use of the ready money necessarily laid out in workmen's wages. Something also should be allowed for risk, as builders are liable to have bad debts as well as other tradesmen.

Having said thus much respecting surveyors, I will now allude to one or two abuses that have lately been introduced among architects. It is now the fashion among some of the principal architects not to allow the builder to employ a surveyor to measure his work, but to insist upon the builder leaving it entirely to the architect's clerk or to a surveyor named by him. Every practical surveyor must at once see the evil consequences of this mode of proceeding; because he must know that, even with the greatest caution and with the utmost rectitude of intention, mistakes will creep in if only one surveyor is employed. Even the simple circumstance of omitting to double

or treble a dimension, may make some hundreds of pounds difference. It is this species of error that causes so great a difference in estimates for work to be performed, and frequently have I known this to be the case. I recollect certain estimates that were made for building a church, and the difference was very great between the two lowest; the parties compared books, and it was discovered that in the lowest the amount of the gallery had not been doubled; every other part was taken by both parties as accurately as could be required. What is most disgraceful in the modern practice alluded to is, that the architect's clerk or surveyor frequently charges the builder a commission for measuring; or, what is equally bad, he gets the tradesman to repair or paint his house, or to execute some other job, which the latter is obliged to do to keep himself in favour, the architect, at the same time, not forgetting to charge his employer with his commission for measuring.

Another disgraceful practice, which is either owing to ignorance or knavery, is that some architects deceive their employers, by making very pretty and attractive drawings, and reporting that the expense of carrying these into execution will be about half or two-thirds of what it actually turns out to be. In this way they obtain the sanction of their employer to commence building; and when the accounts are sent in, the employer finds himself involved too frequently in ruinous expenses. The builder, in such cases, often gets into disgrace, and is either obliged to commence an action to obtain his rights (because the architect has the knavery, in order to screen his ignorance, to say that the builder's bill is a most exorbitant one), or to have his bill cut down so low that he is left a loser instead of a gainer, after labouring hard for twelve or eighteen months. To remedy this evil, I would advise the parties intending to build to contract with the architect for his commission, as well as with the builder for his work. This might be done in the following manner:—If the architect reports that the building will amount to 2,000*l.*, his commission should be fixed at 100*l.*; and, if the work exceed 5 per cent. beyond his report, it should be arranged that there should be a deduction from his commission of 5 per cent. on the excess of the amount beyond the original estimate. Thus, if the original estimate were 2,000*l.* and the actual cost 2,500*l.*, the commission of the architect, instead of being 125*l.*, as it would be by the present custom, would be only 75*l.*; whereas had the amount been within 2,100*l.*, his commission would have been 100*l.* By thus reducing the architect's commission, instead of increasing it when the expense exceeds the estimate, as is now the practice, the temptation to give in false estimates would be diminished, though these estimates are likely to be often made as long as the inducement is so strong as it is at present.

Another very paltry trick common among some architects is their custom of exacting from the builder a commission for all works done under their direction, and, if this be refused, informing the builder that his services are no longer required.

Having said this much, allow me to point out a mode by which, I think, these abuses might be remedied. This is simply to form a society, not for eating and drinking, or backbiting their brethren, but to make rules for the governance of the profession; to make a fair tariff of prices, according to the variation of the market; to regulate the mode of measuring; and to inquire into every abuse or infringement connected with the profession. I have no doubt that if thirty or forty respectable members of the profession would form such a society, it would very soon eradicate the numerous abuses which at present exist, and that architects and surveyors would soon regain that respect with the public which they formerly possessed.

#### Trusteeships v. Mortgages.

SIR,—The recent decision of Mr. Justice Kay limiting the sum to be advanced on mortgage to one-half the estimated value of securities, as in the case of *Fry v. Tapson*, reported in the current number of *The Law Reports*, Chancery Division, will strike terror into trustees, alarm building speculators, unnerve lawyers, stop building, and throw thousands out of employment, and at no time could such a decision have been given more inopportunistically—trade bad, industrious men out of employment, and distress rapidly increasing. The building industry of the country is a very large and important industry, and to cripple it means ruin to thousands. The large towns throughout the country are extended mainly on borrowed capital, and much of that capital is trust funds; but if trustees may not, in safety, advance more than 50 per cent. of the reported value of property, speculators cannot take trust money. The effect will therefore be to raise the price of all securities that trustees may invest in, and reduce the incomes

of all those who depend for revenue on trust money. The business of building material merchants will be ruined; the import and manufacturing enterprise of the country, so far as timber, iron, stone, bricks, slates, ironmongery, &c., are concerned, will be paralysed; shopkeepers will have their business largely reduced, with an augmentation of poor-rates and a reduced exchequer; whilst many lawyers will find their occupation gone, unless Judge Kay's decision is upset or circumvented. An appeal may (as appeals generally do) reverse it; but that may be a lengthy process, and in some minds would still leave doubt. A readier and more certain proceeding will be by means of a short Act of Parliament defining the proportion of value that may be advanced by trustees on land and houses—say two-thirds or three-fourths. This would reassure trustees, give confidence to lawyers, and protect the building industry of the country. If this be not done, the further effect will be to deter private people from undertaking trusteeship. People will, therefore, have to employ solicitors as trustees, and, of course, they will charge for their services. A man may have a pretty good estate put by for his children; but, if he is a prudent man, he will not undertake the obligations of trusteeship, and so jeopardise his estate. Whilst the panic lasts the large building societies will have an opportunity of selecting good securities on their own terms, and it is just possible that mortgage companies will be projected to pick up the business which may be seeking financial friends. Some time back a mortgage company was floated with a capital of a million and a half, and had to be wound-up for want of business. It is said that everything comes to those who wait. Had that company waited till the present it would have found its time had come.

I am yours, &c.,

T. E. KNIGHTLEY.

#### The New Street from Bloomsbury to the Haymarket.

SIR,—I have seen the letter by "Argus" inserted in *The Architect* of last week, and fully endorse the views expressed. I have no hesitation in saying that the approach to this new thoroughfare is absolutely spoilt by the said public-house remaining at the corner. Walking from Bloomsbury Square in that direction, the building in question is in my opinion one of the most unsightly blocks in any part of the metropolis. What the Board of Works have been thinking of by allowing it to remain must puzzle everybody who has the slightest idea of either convenience or architecture.—I enclose my card, and remain yours respectfully,

ARCHITECT.

March 31, 1885.

#### NEW BUILDINGS.

**Public Baths, Pollokshields.**—The new baths in Leslie Street, which have been erected by a company, are now open. They consist of a Turkish bath, a swimming bath, measuring 75 feet by 35 feet, and having an average depth of 4 feet 9 inches; plunge, spray, wave, douche, rain baths, &c., with a gymnasium, billiard-rooms, &c. In the construction of the buildings concrete has been largely used. The heating is by hot-water pipes, and in four hours in winter the swimming baths can be raised 70 deg. Mr. James Hamilton was the architect.

**Savings Bank, Salford.**—The trustees of the Manchester and Salford Savings Bank have undertaken a new bank for their Salford business. The site is in Chapel Street, the chief thoroughfare of the borough. There is to be a spacious and commodious bank, with ample cellars, and a number of other apartments. Messrs. Medland and Henry Taylor, of Manchester, are the architects, and Mr. Thomas Scott the builder. The design is Italian. The material chiefly brick—glazed brick in the bank room, which has a wooden panelled ceiling, so that no plaster is required.

#### CHURCH BUILDING AND RESTORATION.

**Ashton-under-Lyne.**—At the Manchester Consistory Court on March 27, application was made for a citation with reference to the erection of a new tower to the parish church. It was stated that the existing tower was in an insecure and dangerous condition, and that the architect (Mr. J. S. Crowther) had advised its removal and reconstruction. It had a fine peal of ten bells, which, however, had not been rung for the last two years. The new tower would be of the same breadth from north to south as the present one, and three feet longer as from east to west, thereby making it a perfect square building. Thirteen graves would be interfered with, but there had been no interments in any of them since 1821. The promoters undertook to remove the remains of the bodies to new graves and to replace the present stones on them. The cost of the work, between 8,000*l.* and 9,000*l.*, would be defrayed by voluntary subscriptions, of which 4,500*l.* had been promised or paid. The Court decreed a citation in accordance with the application.

**Holywell Church.**—In the description of this church, which appeared last week, it should have been stated that the contract for the renovation was undertaken by the Midland Joinery Company, and that the woodwork, including the pulpit, stalls, &c., executed by them, has received much commendation.

#### GENERAL.

**The Paintings and Drawings** which have been sent to the Salon this year are 7,200 in number, or about 500 less than last year.

**Mr. E. Burne Jones** will not send a picture to the exhibition of the Grosvenor Gallery this year, owing to the engrossing character of a large mosaic on which he is engaged.

**Mr. W. B. Scott** intends to dispose of his collection of etchings, engravings, and drawings, and from the care taken in the selection they are likely to attract high prices. There are a great many drawings by William Blake.

**Mr. Boehm** has completed the model of the statue of the late Mr. Bass which is to be erected in Derby.

**Mr. E. Griffiths** has obtained the commission for the sculpture of the new Museum of Science and Art which is being erected in Chester from the designs of Mr. T. M. Lockwood.

**Mr. J. D. Sedding** has been appointed architect for the restoration of the great screen in Winchester Cathedral.

**The Nottingham Town Council** have purchased Mr. W. S. Jay's picture *At the Fall of the Leaf* for the Art Gallery.

**The Building Committee of the Salford Town Council** have proposed that any new street to be hereafter laid out not exceeding 440 yards in length should be not less than 12 yards in width, and that a resolution allowing streets which do not exceed 100 yards in length to be 10 yards in width be rescinded.

**M. Geoffroy Dechaune** has been nominated conservator of the Museum of Comparative Sculpture in the Trocadéro, Paris.

**Mr. Alex. J. Scally**, who has been for the last ten years principal draughtsman in the Burgh Engineer's Office, Edinburgh, has received an appointment as surveyor for the World Publishing Company, in New South Wales.

**M. Clermont-Ganneau** has brought out his book on the archaeological frauds in Palestine that he was instrumental in unmasking, and for which English people should be grateful, as he saved the authorities from expending money on worthless fabrications.

**A Four-light Munich Window** has just been erected in St. Mary's Church, Arbroath, the gift of Mr. and Mrs. Muir, of Abbey Bank. It occupies the west end of the church, and the leading features of the window are large sized figures of St. Paul, St. Peter, St. Andrew, and St. John, while under each apostle is a small subject, descriptive of a scene in his life. The artists are Messrs. Mayer & Co.

**A Committee** has been appointed for the establishment of an art school and art museum in Colchester.

**Mr. E. H. Bental** has offered to give 100*l.* towards the completion of the restoration of the parish church of Heybridge, the tower of which still remains untouched, provided that another 100*l.* is raised and added to the funds now required for the purpose.

**Messrs. Landless & Clifford**, of Glasgow, have been appointed architects for the new Board School which is about to be erected at Hamilton Crescent, Partick. There were thirteen competitors.

**An International Sanitary Conference** is likely to be held in Rome during May.

**The Council of Rossall School** contemplate making various alterations and extensions at an estimated cost of about 18,000*l.* Among the extensions it is proposed to erect studies and dormitories for 125 boys, three house-rooms, seven masters'-rooms, and science class-rooms.

**Mr. H. H. Leonard**, quantity surveyor, Bishopsgate Street, has taken Mr. Stanley Clarke into partnership.

**Stapleford Hall, Leicestershire**, has been purchased by Mr. Hornsby, of Grantham. It belonged at one time to the Earls of Harborough. The hall is built of stone, and the earliest portion was erected about 1500 by Mr. Thomas Sherard, according to a date on the east front; and on another part of the building a tablet states that "William Lord Sherard, Baron of Leytrim, repaired this building A.D. 1631."

**The Memorial Stone** of the new St. Mark's Schools, at Manningham, Bradford, was laid on Saturday by the mayor. The architects of the building are Messrs. Morley & Woodhouse.

**St. Bernard's Well**, with the adjoining ground, which in the last century formed a favourite resort of the citizens of Edinburgh, have been purchased by Mr. William Neilson, and will be made over to the Corporation.

**The Dublin Corporation** intend to borrow 100,000*l.* for paving streets in the city, having a length of 11½ miles, and a superficial area of 170,551 yards.

A Business Supplement

# The Contract Reporter.

to The Architect.

LONDON, APRIL 4, 1885.

## ART DECORATION.

THE development of Lincrusta-Walton as an art decoration will receive considerable impetus from the advantages obtained by means of the invention of a process recently patented by Mr. Fredk. Walton, for decorating this beautiful material. Architects and decorators will now be enabled to offer their clients at a nominal additional cost most elegant and artistic effects, such as have hitherto been confined to the wealthier classes, owing to the great expense of skilled manual labour. The process, like most valuable inventions, is very simple, but is much more perfect in its action than handwork, as it cuts out the relief in colours with the greatest precision and accuracy. It does not, however, dispense with the introduction of handwork, where deemed advisable, but can be made subservient to it by preparing the more mechanical parts of the decoration for further and more detailed elaboration by hand afterwards. Messrs. Fredk. Walton & Co. have wisely determined to give the large margin of profit between the new process and that of skilled manual labour to the public, thus enabling them to offer beautiful effects of colour at a very low price in comparison with what they have cost in the past, anticipating their profit on a much larger demand for Lincrusta, which they believe, and we think justly, will be created by means of this improvement. It should be stated that Lincrusta-Walton is washable, practically imperishable, and at once the most sanitary, artistic, and economic material for wall decoration that has yet been produced. The public will not be slow to recognise the great advantages to which we have referred, and we believe that the introduction of the above-mentioned processes will create for Lincrusta-Walton a more largely increased demand. To those who are contemplating decoration, we advise a visit to the company's show-rooms, 9 Berners Street, London, W., as in addition to these improvements the company are producing some new patterns for the coming season of considerable artistic merit, which are worthy of the notice of art connoisseurs.

## LIGHTNING CONDUCTORS.

MR. JOHN JONES, art metal worker, Walker's Croft, near Victoria, Manchester, has one important branch of work in the manufacture and fixing of lightning-conductors, for which he is well known, and for putting up which his workmen go to all parts of the kingdom. Mr. Jones has just completed the work of fitting lightning-conductors to the Wigan and the Bradford Infirmary, Rainford and Chaddesden Halls, and many other public buildings. Mr. Jones's experience as to the efficiency of lightning-conductors is that copper has stood the test as being the most suitable material to be used, and further that the rope and solid band conductors have the preference over all others. The means by which Mr. Jones aims at insuring the efficient working of lightning-conductors is to have

sufficient sectional area in proportion to the length of the conductor, perfect continuity throughout the entire length, and perfect contact at its base with moist earth—or, better, a bed of coke or charcoal. To insure the safety of buildings the conductor must be fixed on its highest or most exposed point. Branch conductors should be used on such other points as are outside the "cone of safety" (being a radius of twice the height of the rod), and connected with the main conductors. All external metal work on the roofs should be connected with the conductors, and care taken to increase the sectional area in order to avoid lateral discharge. An extensive range of buildings should have several main conductors. Mr. Jones's copper wire rope conductors, and his solid copper band conductors, are of various sizes, all approximately proportioned to the height of the building; solid copper points, single, triple, and quintuple, in sizes to suit conductors; elevating rods, connecting pieces, cramps, staples, insulators, &c. The conductors are applied to church spires, factory chimneys, warehouses, mansions, farm buildings, &c. Of course the devising and fixing of lightning conductors necessarily vary with the situation, and should only be carried out by those who are properly qualified to design and place them; for, as was said in one of the "Tesserae" a week or two back by Mr. Highton:—"Knowing from experience the terrific power of lightning, I must still assert that, as a person may be poisoned by an improper application of medicines, so may a building be destroyed, or even human life sacrificed, by an improperly or injuriously erected lightning conductor." It may be noticed, in conclusion, with regard to other work, that Mr. Jones has just fitted up St. Joseph's Church at Sale with gas-fittings to order in iron.

## COMPETITIONS OPEN.

BOOTLE.—May 1.—Plans and Specifications are invited for the proposed Erection of Public Baths. Mr. J. Alexander, Borough Surveyor, Bootle.

WIMBLEDON.—Plans are invited for proposed Free Library. Mr. W. H. Whitfield, 5 Southampton Street, Bloomsbury, W.C.

## CONTRACTS OPEN.

ABERDEEN.—April 4.—For Building Part of Steading of Offices at Wardhead. Mr. James Strachan, Milton, Lumphannan.

ABERDEEN.—April 14.—For Station Building at Brickie, Nether Buckie, Portgordon and Fochabers, on Great North of Scotland Railway. W. Moffatt, Secretary.

AIRDRIE STATION.—April 6.—For Iron Roof, &c. Mr. J. Strain, C.E., 154 West George Street, Glasgow.

ARMAGH.—April 11.—For Fitting Laundry with Steam Engine, Boilers, Drying Closet,

Hydro-extractor, Wringing Machine, &c. Mr. J. Boyd, Architect, 9 Donegall Square West, Belfast.

ARMTHORPE.—April 8.—For Restoring Church. Mr. C. H. Fowler, Architect, The College, Durham.

ATHERSTONE.—April 11.—For Construction of Waterworks (Engine and Boiler-houses, Chimney Shaft, &c., Reservoir) and Supply of Iron Pipes, Engines, Boilers, &c. Mr. Baldwin Latham, C.E., 7 Westminster Chambers, S.W.

BATH.—For Erection of Infant School at Larkhall. Mr. C. Bryan Oliver, Architect, Bath, and 76 Guilford Street, London.

BELFAST.—April 13.—For Building School-house. Mr. Henry Seaver, B.E.; Architect, 35 Royal Avenue, Belfast.

BERMONDSEY.—April 16.—For Additional Water-closets, Lavatories, Bathrooms, and Relief Offices at the Workhouse, Tanner Street. Messrs. H. Saxon Snell & Son, Architects, 22 Southampton Buildings, Chancery Lane.

BICTON.—April 13.—For Building Church. Mr. A. E. Lloyd Oswell, Architect, Dana Chambers, Shrewsbury.

BISHOPSTOKE.—For Building Dwelling-house. Mr. A. W. Galbraith, Architect, 9 Southgate Street, Winchester.

BOURNEMOUTH.—April 14.—For Building on Pierhead 250 feet run of Shelters, &c., Wind Screens of Wrought-iron Girders, Plate-glass, Zinc Roofing and Woodwork, &c. Mr. R. W. Peregrine Birch, C.E., 2 Westminster Chambers, Victoria Street, S.W.

BRADFORD.—April 4.—For Building Wesleyan Sunday-schools. Messrs. Morley & Woodhouse, Architects, 15 Darley Street, Bradford.

BRADFORD.—April 7.—For Construction of a Reservoir at Sedburgh, to hold about 3,000,000 gallons, with Filter Tanks, &c. Messrs. Milner & France, Architects, Swan Arcade, Bradford.

BRADFORD.—April 8.—For Building Eight Houses for the Brick and Tile Co. Mr. R. Calvert, Architect, 9 New Kirkgate, Bradford.

BRIXHAM.—April 8.—For Rebuilding (First Section) Parish Church. Rev. R. Elrington, Vicarage, Brixham.

CARDIFF.—April 16.—For Building Thirty-four Shops with Cellars, Offices, &c. Mr. J. P. Jones, Architect, 27 Park Street, Cardiff.

CHELSEFIELD.—April 16.—For Building Schools, with Master's Residence, &c. Mr. G. St. Pierre Harris, Architect, 1 Basinghall Street, E.C.

CHESTHILL.—April 20.—For Additions and Alterations to Invervar Lodge and Steading. Mr. John Hamilton, Chesthill, Fortingal, N.B.

CORK.—For Building Four Houses, Western Road. Mr. J. F. M'Mullen, C.E., 34 Mary Street, Cork.

CREWKERNE.—April 8.—For Building two Dwelling-houses, with Shops and Business Premises. Messrs. Packham & Croote, Architects, 93 Paris Street, Exeter.

DEWSBURY.—For Building Four Houses and Shop. Mr. F. W. Ridgway, Architect, Church Street, Dewsbury.

**DUNDEE.**—April 4.—For Building Rosebank Public School. Mr. David Maclaren, Architect, 81 Murraygate, Dundee.

**EASTINGTON.**—April 22.—For Works at Parish Church. Messrs. Waller, Son & Wood, Architects, 17 College Green, Gloucester.

**EAST DEREHAM.**—April 10.—For Works to Nave and Aisle Roofs, Warming Parish Church, &c. Mr. E. P. Willins, Architect, Bank Plain, Norwich.

**ELY.**—April 4.—For Supply of Cast-iron Pipes, Sluice Cocks, Engines, Pumps, Boilers, &c., and Building Engine and Boiler House, Coal Store, Chimney Shaft, Cottage, &c. Messrs. Easton & Co., C.E., 11 Delahay Street, Westminster.

**FIFE-KEITH.**—April 8.—For Erection of Buildings for the Institute Company. Mr. F. D. Robertson, Architect, Fife-Keith.

**GALWAY.**—April 15.—For Building Constabulary Barrack. Mr. W. B. Soady, Office of Public Works, Dublin.

**GALWAY.**—April 15.—For Building Post Office. Mr. W. B. Soady, Secretary, Office of Public Works, Dublin.

**GYFFELLON.**—April 6.—For Building Chapel. Mr. Watkin Williams, Hafod.

**HALIFAX.**—April 4.—For Erection of House and Shop at Lee Mount, Ovenden. Messrs. Horsfall & Williams, Architects, Post Office Buildings, Halifax.

**HALIFAX.**—April 9.—For Erection of Shops and Houses at junction of North Bridge and Cross Hills. Messrs. G. Buckley & Sons, Architects, Halifax.

**HASTINGS.**—April 8.—For Two Compound Beam Engines with Surface Condensers, Four Bucket and Plunger Pumps, Set of Three-throw Pumps and Steel Lancashire Boilers. Messrs. Easton & Co., 11 Delahay Street, Westminster.

**HASTINGS.**—April 9.—For Building Row of Shops with Mansions over on the Sea Front. Mr. A. Wells, Architect, 25 Havelock Road, Hastings.

**HEYWOOD.**—April 8.—For Supply of Cast-iron Pipes and Sluice Valves. Mr. J. Diggle, Engineer. Mr. Andrew Waller, Town Clerk.

**HUDDERSFIELD.**—April 8.—For Building Long Chimney and Additions to Central Depot. Mr. R. S. Dugdale, Borough Surveyor, Town Hall, Huddersfield.

**HUDDERSFIELD.**—April 9.—For Alterations and Additions to Springfield, Edgerton. Messrs. J. Kirk & Sons, Architects, Huddersfield.

**HULL.**—April 16.—For Water Main Piping (2,000 tons). Mr. D. Maxwell, C.E., Town Hall, Hull.

**ILKESTON.**—April 7.—For Brickwork of Retort House and Erection of Retort Beds, Fitting Shop, Chimney Shaft, &c., at Gasworks. Mr. Wright Lissett, Clerk, Town Hall, Ilkeston.

**KEIGHLEY.**—April 8.—For Building Warehouse, Cross Road Mills. Mr. J. Judson, Architect, Bogthorn, Keighley.

**KNARESBOROUGH.**—April 13.—For Taking Down Three Houses and Building New House. Mr. W. Clemshaw, Finkle Street, Knareborough.

**LEEDS.**—April 4.—For Building Eight Houses. Mr. T. Ambler, Architect, 9 Park Place, Leeds.

**LEEDS.**—April 8.—For Alterations to House. Mr. D. Dodgson, Architect, 16 Park Lane, Leeds.

**LEES.**—For Building Bleach Works. Mr. J. Barnes, Architect, Yorkshire Street, Ashton-under-Lyne.

**MANCHESTER.**—April 10.—For Erection of a New Bakehouse, with Flour Store, and also for a New Washhouse, at the Cottage Hospital at the Workhouse, Withington. Messrs. Mangnall & Littlewoods, Architects, 29 Brown Street, Manchester. Mr. W. N. Edgill, Clerk to the Guardians, Charlton.

**MIDHURST.**—For Rebuilding Iping Church. Mr. E. P. Loftus Brock, F.S.A., Architect, 19 Montague Place, Russell Square, W.C.

**POPULAR.**—April 11.—For Building Dwelling-houses for Pier-master and Crew. Messrs. A. & C. Harston, Architects, 15 Leadenhall Street, E.C.

**RADNOR.**—April 6.—For Erection of Timber Bridge at Llanbister, according to plans by County Surveyor, Rhayader. Mr. W. Stephens, Shirehall, Presteign.

**REIGATE.**—April 7.—For Building Infectious Hospital and Cottage. Mr. E. Larmer, Architect, High Street, Reigate.

**RICHMOND.**—April 8.—For Building Post Office. H.M. Office of Works, 12 Whitehall Place, S.W.

**ROCHESTER.**—April 4.—For Building Boys' School at Strood. Mr. Richard Pratt, Clerk to the School Board, Eastgate, Rochester.

**RUGELEY.**—April 8.—For Alterations and Additions to Grammar School. Messrs. Radcliffe and Holdsworth, Architects, Birkenhead. Mr. R. Landor, Clerk to Governors, Rugeley.

**SOUTHPORT.**—April 16.—For Erection of School for 489 Children in Swire and Bury Roads, Birkdale. Mr. C. A. Atkinson, Architect, 35A Castle Street, Liverpool. Mr. H. S. Threlfall, Clerk to the School Board.

**SOUTH MILTON.**—April 11.—For Restoration of Church at South Milton. Archdeacon Earle, West Alvington, Kingsbridge.

**OWERBY BRIDGE.**—April 7.—For Erection of Goods Offices, Lancashire and Yorkshire Railway. Mr. J. H. Stafford, Secretary, Manchester.

**SYDNEY.**—June 1.—For Steel Bridge to Carry Double Line of Railway over the River Hawkesbury. Mr. S. Samuel, Agent-General for New South Wales, 5 Westminster Chambers, S.W.

**WELLINGTON.**—April 11.—For Laying Cast-iron Pipes, Erection of Pumping Station, Water Tower, with Adit and Well. Mr. E. Pritchard, C.E., 2 Storey's Gate, Westminster.

**WHICKHAM.**—April 6.—For Building Conservatory (to cover 1,500 square yards), Dunstan Hall. Mr. F. R. Wilson, Architect, Alnwick.

**WHICKHAM.**—April 21.—For Billiard-room, Smoke-room, &c., Dunstan Hall. Mr. F. R. Wilson, Architect, Alnwick.

**WIGAN.**—April 6.—For Erection of a new Church at Lower Ince. Messrs. Paley & Austin, Architects, Lancaster.

Established 1820.]

INTERNATIONAL HEALTH

3 Silver and 4 Bronze Medals

**HENRY CONOLLY.**

LIMITED,  
MANUFACTURING SANITARY ENGINEERS,

Call the attention of Architects, Surveyors, and Builders to their Closets, the advantages of which will be readily seen by the accompanying Illustration.

**THE "SAFETY" VALVE WATER-CLOSET,**

WITH

Conolly's Reversible Trap (Patent No. 3,754).

This drawing illustrates an improvement in the trap of a Closet, which admits of the outlet being placed in any position to suit the soil-pipe. This object is attained by means of a collar, which is similar in shape to that of an ordinary Valve-Closet. The base of the collar being round is flanged A; this is attached to a corresponding flange B, formed on the end of Trap by means of screw bolts, and from the drawing it will be seen that the outlet can be fixed in any position. It is obvious that this system can be adopted in every case where a separate Trap is employed.

The "Safety" Valve Water-Closet, like the "Nestor" as regards the Basin, is made with a cast lead trap above the floor line. The Trap is constructed so that the water-line is within 1½ in. of the seating of the Closet; therefore it will be seen if there become any defect in the indiarubber seating, the trap still remains sealed; by this means the necessity of a ventilating pipe is also dispensed with, also the old system of having a weeping pipe from the supply to the Lead Trap fixed in the box of Closet, there being no space for the generation of gases. The overflow arm is also protected from the possibility of soil corroding the edge of pipe, as the clack is made to open against it.

CAN BE SEEN IN ACTION IN NEW SANITARY SHOW-ROOM.

**53 & 55 Hampstead Road, 169 & 171 Drummond Street.**  
WAREHOUSES—TOLMERS SQUARE, N.W.

YORK.—April 4.—For Erection of a Flour Warehouse and Offices in Hangate. Mr. W. G. Penty, Architect, Clifford Chambers.

| HARDEN (accepted) | 67  | 0 | 0 |

# STAINS FOR WOOD FLOORS.

LIGHT OAK.

Applied to Ordinary Deal gives an exact imitation of Old Polished Oak Floors.

IMMENSE SAVING IN THEIR USE,

As no size or varnish is required, the application of one coat only taking the place of two coats of size, one of stain, and one of varnish by the ordinary process.

INVALUABLE FOR THE BORDERS OF ROOMS,

As they do not scratch like ordinary varnished surfaces, and the cost of staining would be about 1½d. a square yard, as against 4s. or 5s. per square yard for carpet.

GREAT PREVENTIVE TO CONTAGIOUS DISEASES.

Dr. Koch, in a recent lecture on Cholera, stated that polishing and dry-rubbing floors was a greater protection than washing floors. Prices, 10s. 6d. per gallon; 6s. 6d. per half-gallon; 4s. per quart. Half a gallon will do a 3-foot border round a large room.

## TORBAY PAINT COMPANY,

26, 27, and 28 BILLITER STREET, LONDON, E.C.

**EXAMINATION UNDER THE METROPOLITAN BUILDING ACT (18 & 19 Vict. cap. 122, sec. xxxii.), and under the Acts of Parliament, &c.—The Board of Examiners appointed by the Royal Institute of British Architects to examine all persons presenting themselves for that purpose as to their competency to perform the duties of DISTRICT SURVEYOR in London, and of BUILDING SURVEYOR under local authorities, and to grant Certificates to Candidates desiring of the same, will hold an Examination on the 23rd and 24th instant. Each Candidate must on or before Friday, the 17th instant, send to the undersigned an Application drawn upon a form to be previously obtained from them; and each Candidate will be required to attend at the Royal Institute of British Architects on Thursday, the 23rd instant, from 10 A.M. until 1 P.M., and from 2 P.M. until 5 P.M., for the WRITTEN AND GRAPHIC Examination; and on Friday, the 24th instant, at 12 noon, for the ORAL Examination. Each Candidate on sending in his formal Statement and Application must pay to the Royal Institute of British Architects a fee of TWO GUINEAS; and each Candidate on receiving his Certificate, should the same be granted to him, must pay to the Institute a further sum of THREE GUINEAS. The Questions, written and graphic, set at these Examinations are not published.**

GRUNDY'S PATENT  
WARM-AIR  
VENTILATING FIRE GRATE.

The novelty, superiority, and advantage of this patent consist in the heating surface being greater than any other Fire-grate introduced to the public. It is very simple in construction, and is made in the form of a Stove, the back of which is semicircular in shape, with gills behind and smoke-nozzle on top, all cast in one piece. The same can be attached to any design of a Register or Stove front. It is very suitable for schools, class-rooms, waiting-rooms, hospitals, offices, dormitories, and dwelling-houses, from the cottage to the mansion. Design and specification post free on application.

## TESTIMONIALS.

"9 Victoria Chambers, Westminster, S.W.

"June 10, 1884.

"SIR,—I have much pleasure in testifying to the efficiency of your patent Warm-Air Fire Grate. It has been very successful, and given every satisfaction where I have used it.

Yours, &amp;c.

"To Mr. Grundy. JAMES WEIR, F.R.I.B.A."

"Baptist Chapel, Clapham Common, London. Richard Webb, Pastor, 10 Grafton Square.

"February 15, 1884.

"DEAR MR. GRUNDY,—I have pleasure in testifying to the excellency and efficiency of your patent Fire-Grate. It is the most charming invention for heating a large room I have ever known. I shall have pleasure in showing it to anyone who wish to have their schools or rooms pleasantly and efficiently heated."

From James Garry, Esq., Architect, West Hartlepool,  
July 1884.

"DEAR SIR,—I have very great pleasure in stating that the first stove, or patent warm-air ventilating fire grate, adopted by me in school at Seaton, and a second in a Cocoa Palace, have given such satisfaction that I now order eleven to be inserted in New Upper Grade Schools in course of erection at West Hartlepool. They are the most economical, efficient, and easily managed stove at present before the public.

"Mr. John Grundy."

From Hon. and Rev. G. G. C. Talbot, M.A., Withington,  
Cheltenham.

"DEAR SIR,—You will be gratified to hear that the school is completely warmed by your new grate. It is the most economical and efficient that I have ever seen.

"Mr. John Grundy."

From E. J. Yates, Esq., Architect, Birmingham.  
"The best of the kind I have seen. I shall have pleasure in securing their adoption whenever opportunity offers."

## TO THE ARCHITECTS OF THE UNITED KINGDOM.

**MR. FREDERICK HENRY SMITH, of No. 52 Queen Victoria Street, E.C.,**

INVENTOR, PATENTEE, AND SOLE PROPRIETOR OF THE PATENT AUTOMATIC ASPIRATOR SYSTEM  
OF VENTILATION, LIGHTING, AND HEATING,

Finding it beyond his power to attend to the many applications to apply his System of Ventilation in so many different parts of the country, without increasing his Staff, has been advised by an eminent Architect to appoint Agencies in the Counties of the United Kingdom, whose duty it will be to prepare Plans, Specifications, and Estimates, and to superintend all works where the Syphonic Aspirator System may be applied.

For further particulars, terms, &c., &c., apply in the first instance, by letter only, at the address of the Patentee above given.

The ONLY MEDAL for ROOFING TILES at the INTERNATIONAL HEALTH  
EXHIBITION, 1884, was awarded to

**H. J. & C. MAJOR,**

Late SEALY. Established upwards of 200 Years.

**THE PATENT TILE WORKS,  
BRIDGWATER.**

Sole Manufacturers of Non-Porous ROOFING TILES, of various patterns, having  
C. Major's Patented Improvements, which, forming a double "rabbet" at the top,  
bottom, and sides of the Tiles, and avoiding cut or unprotected corners, make a secure  
lap that PREVENTS "WIND-STRIPPING" and ENTIRELY EXCLUDES DRIFTING RAIN AND  
SNOW.

Manufacturers of the Imperial Bath Scouring Bricks, Patent and other Roofing Tiles,  
Bakers' Oven Tiles, &c., &c.

## BUILDING EXHIBITION AT THE AGRICULTURAL HALL.

THE Building Exhibition at the Agricultural Hall closed on Saturday night last, and with the following notices we propose to conclude our description of the exhibition:—

Frederick Henry Smith, 52 Queen Victoria Street, E.C.

In speaking of the application of the patent automatic syphonic aspirator to buildings, it will be remembered, from the description given in last week's *Architect*, that there are two aspirators of different construction, the one having a jacketted inlet surrounding the outlet for fresh air, the other taking in the same through a tube led into the top plate or outer disc. The aspirator fitted with the jacketted inlet is applicable for such buildings as churches, theatres, or concert-rooms, lecture-halls, and all buildings, in fact, mainly consisting of one large room terminating with roof in open air. An important matter is the applicability of Mr. Smith's system for the ventilation of drains and sewers. Brick shafts, about 4 feet in diameter, should be erected in suitable places—if at the junction of a series of converging sewers, so much the better—carried up high enough to clear the tops of houses, and on the shafts one of Smith's aspirators, with a 2 to 3-feet outlet, which would give a continuous uprush of sewer gas with no down draught. The warmed air from the sewer—seldom less than 52 degrees Fahrenheit—emerging from the outlet would not only draw in through the inlet-pipe the motive deodorising

power which disperses it at once into the outer air, further deodorised and rendered innocuous, but would also keep up a continuous circulation and thus prevent stagnation. The air passing in at the inlet and discharging itself through the annular space, performs a dual function, for whilst assisting in carrying off the foul air, it at the same time acts as a counter check to cold air being drawn down the shaft and forcing the noxious fumes through the street gullies. Special induct air shafts—that is, inlets to bring fresh air into sewers—are quite unnecessary. Sufficient air gains access through the numerous existing inlets. The uses, however, to which the aspirator may be applied are manifold, but space will not permit of commenting on more than one or two. Drains and soil-pipes should be ventilated separately, and it is unadvisable to ventilate a drain into which others may debouch through the soil-pipe. A drain 9 inches, 6 inches, or 4 inches (the first is as much too large as the last-named is too small for the main drain of any ordinary mansion or private house) is more hermetically sealed than any sewer, therefore an inlet for fresh air to maintain a constant current through it is in this case necessary. A drain syphoned off from its connection with sewer or cesspool, and a 4-inch shaft fitted with an aspirator, with an inlet for fresh air on the house side carried up to the ground level, would effectually prevent any accumulation of impure air in the drain, and, consequently, foul emanations oozing from the inlet grating. A 6-inch house drain seldom runs full-bore; a 9-inch practically never. The ordinary flow through the former is from one to two inches, occasionally half-bore. Sewage flowing through a 6-inch drain does not ordinarily drive air out of open grids or air inlets unless running three-fourth to full-bore; the tendency is rather to work backwards towards the exhaust shaft (which is the long leg of the syphon), and if an aspirator be fitted thereon down-draught is counteracted; and also an air motor provided, which levers up the air products of the drain automatically, working with equal precision in hurricane or calm. In hospitals, infirmaries, &c., owing to sickness

Show Room for Chimney-pieces, 9 Castles Street, Holborn.

the causes of vitiation are more abundant than under other circumstances. Mr. Smith's system has been applied to one of the wards of the French Hospital, Lisle Street, Leicester Square, by way of an experiment. Among the points to be noticed there are the purity of the atmosphere in the ward as compared with that of the outside corridors, next the genial temperature—about 68 degrees—and lastly the novelty of bringing in fresh air, no less than the means used for carrying off the vitiated. The former was brought in from the outer air through two iron gratings, one foot square, fixed on the face of the wall, communicating with two square boxes cut in the brickwork, of the same dimensions. With these air-boxes a hollow moulding, which passes round the top of the room leaving a space of 3 inches between it and the wall for the passage of air, is connected. From this moulding four square wooden tubes for the transmission of air down to the air-boxes, 6 inches by 3 inches, are provided, the air-boxes being carried round the room on the floor-level, to correspond with the moulding above. These floor-boxes have an inch cut off from the bottom of the front-plate, to allow of the gradual diffusion of fresh air on the ground-level. In the ceiling are fixed four aspirators from out to out, with 4-inch outlets; the inlets and outlets are carried along and between the joists of the floor above to the outer air, and then connected to two 4-inch vertical pipes. It should have been mentioned that the aspirators are placed directly over the beds of the patients, about 4 feet above their heads, there being two on either side of the room, and these are led into two separate horizontal pipes carried between the joists of the room above. The air in the ward was all that could be desired. A gaselier is kept burning during the night, and the windows have not been opened since the system was first adopted, notwithstanding which, there has been no deterioration in the purity of the atmosphere, and the system has met with the approval of the doctors, nurses, and patients. From what has been said, it may be reasonably concluded that the system may be applied with success to theatres, concert, ball, and lecture-

rooms; to law courts, barracks, &c.; for dormitories, guard-rooms, cells; to conservatories, and also to malt kilns, &c., besides being applicable to railway carriages and other closed vehicles.

J. T. Pennycook & Co.

Messrs. J. T. PENNYCOOK & Co., Wenlock Buildings, 1 Ironmonger Row, E.C., showed Pennycook's patent "Universal" fanlight-opener. The *raison d'être* of the patent is that many schools, churches, hospitals, halls, banks, &c., are now fitted with windows the upper sashes of which only open either by being hinged at the bottom or hung on pivots from the centre, and that architects and builders have found the inconvenience of opening and shutting such upper sashes by means of cords and pulleys when these get disarranged or worn out. In this patent apparatus such complications are dispensed with, and the sash can be opened and shut with perfect ease by the youngest person, even in the face of a strong wind. By a simple arrangement this apparatus is rendered self-sustaining—i.e., by the withdrawal or insertion of a lever handle it is at once either locked or released. The apparatus being constructed of metal is of a lasting and permanent character, and it is also constructed to open a series of sashes or casements at once, either in whole or part. One fanlight opener was shown connected with a burglar alarm. The firm have orders for 1,800 fanlight openers, one single order alone being for 1,500. Improved lightning conductors were also shown. They are in the form of a cable, made from hard drawn square copper wire, which, having sharp edges exposed in all directions, is a good conductor and of great attractive power. The advantage of this form over a solid body will be at once seen, as lightning does not saturate, but travels on surfaces only; while should it strike directly from the cloud on a round smooth surface, it immediately explodes in all directions, just as molten lead will do if dropped from a height on a rounded, smooth or greased surface. This explosion, therefore, endangers everything in proximity to it. To insure additional attractive power, on the top of the conductor are fixed copper

terminal points or vane, also having sharp edges or points, which may, from the height and position of the tower, spire, or chimney stalk, be immersed in the electric cloud. These are used very extensively throughout Scotland, particularly at the dynamite works. The well-known glazing system is also shown.

T. Wilson & Co.

Messrs. T. WILSON & Co., Stowmarket, showed their valuable protected and household alkaline compositions for removing, cleaning, and washing old paint, varnish, &c., without injury to wood or repainting. There is the composition for removing paint, and there is the composition for cleaning; and this latter can be used for cleaning down house fronts, varnished papers, oak furniture, &c., in fact, for all clearing down purposes. The firm hold many testimonials from architects and builders as to the efficacy of the compositions, as also from private gentlemen, as invaluable for use in cleaning up yachts, &c. Specimens were also on view, so that practical proof of the merits of the composition could be seen.

Meakin & Co.

Messrs. MEAKIN & Co., 84 Baker Street, W., showed a full-size model of a window fitted with their patent sash fastener and opener. The apparatus affords a most convenient means of closing the top sashes of large windows, and is specially intended for windows where the ordinary sash-fastener cannot be conveniently reached. The apparatus also automatically looks both sashes when the window is quite closed or left a little open for draughtless ventilation. The patent oilable sash-pullies were also shown—an ingenious application, especially suited for heavy sashes, as they can be lubricated without taking them out of the frames. The patent standard sliding sash was also shown in the form of a handsome plate-glass window, with frame and sash-frames of mahogany. In appearance it is exactly similar to an ordinary window, the sashes moving up and down as usual in their frame; but this frame can be opened inwards, just as the side-lights of green-

## VENETIAN ENAMEL MOSAIC FOR MURAL DECORATION.

Mosaic Works conducted on the same principle as in Venice and Rome by

**A. CAPPELLO,**

472 KING'S ROAD, CHELSEA, LONDON, S.W.

Established in 1880.

15 YEARS IN ENGLAND WITH DR. SALVIATI.

The above Factory is established in London for the purpose of making the Venetian Enamel Mosaic Work an English trade, and to reduce the cost to half the price that has been hitherto charged abroad or by the London agents.

See "Building News," Oct. 12, 1883, in reference to the Mosaic Pictures for the new Church of the Brompton Oratory, executed by this Establishment.

Gold Enamel Mosaic Work at 15s. per sq. ft.  
Venetian Enamel Mosaic Figure Work at 20s. per sq. ft., including expenses of Fixing.

## MOSAIC PAVEMENTS.

TO  
ARCHITECTS, BUILDERS,  
AND  
CONTRACTORS.

## STEEL CUT NAILS!!

The modern and important discovery in the process of making Steel has so reduced the price, that Steel Cut Nails of the well-known "Mitre Brand" can now be supplied at only 1s. 6d. per cwt. more than the price of the ordinary Common Iron Cut Nails.

The Steel Cut Nails are far superior in quality and more uniform in size than any wrought or hand-made Nails yet produced, and being lighter in weight than ordinary Iron Cut Nails and free from rust, they are found cheaper in actual use than common Iron Cut Nails at 1s. 6d. per cwt. less.

These Steel Cut Nails are specially suited for Builders, Joiners, Coopers, Packing-Case Makers, &c., and a single trial is sufficient to convince any one of their superior quality and cheapness.

## PATENT WROUGHT STEEL NAILS. OVAL WIRE NAILS.

houses hung on sash centres at their top can be swung open outwards. The outside of the glass can then be cleaned from inside the room, and also when new sash-lines or other repairs are needed no fixed parts have to be removed, and therefore no damage is done to painted work.

*John Smeaton.*

Mr. JOHN SMEATON, Imperial Buildings, Ludgate Circus, E.C., showed his imperial excelsior spray bath, lavatories, door-action urinal, folding urinal, valve-closets, flush-out closets and cisterns, &c. A folding lavatory, on the same principle as the folding urinal, was shown: these being in the wall when closed, there is no obstructive projection beyond the surface of the wall. An excelsior dust-shoot—the same as those fixed at the First Avenue Hotel—was shown, also the patent cast-lead "Eclipse" traps, and many other sanitary appliances and articles relating thereto. Mr. Smeaton's baths, lavatories, closets, &c., are many and various, to suit all purposes, from mansions, &c., to barracks, hospitals, institutions, and the like. Specially designed and elaborate joinery is also found in connection with them. The exhibit at the hall was suggestive of a wide field of work. Besides hot-water and steam apparatus, sunlights, gas arrangements, Mr. Smeaton also fixes the hydraulic rams for hand or horse-power, &c.

*Williams & Nash.*

A handsome collection of marble chimneypieces formed the characteristic feature at the stand of Messrs. WILLIAMS & NASH, of 9 Castle Street, Holborn. On inquiry it was found that one or two were exhibited to show the renovating powers of a certain marble cream much sold by the firm, the use of which restores to marble that has become stained, dirty, smoke-discoloured, &c., its original freshness; these (two) were handsome old statuary marble chimneypieces from a house in Sloane Square. The many other marble chimneypieces and fenders, with handsome tiled hearths and panels and ornamental registers, would not be out of place amidst the richest surroundings.

The firm are entitled to praise for showing a great variety of native marbles in specimen slabs, &c. The most beautiful works may be got by the use of our own Devonshire and Cornish marbles.

*John Matthews.*

Mr. JOHN MATTHEWS, Royal Pottery, Weston-super-Mare, showed Poole's patent bonding-roll square-cornered roofing tiles *in situ*, by means of a little structure which was roofed with the tiles mentioned. The excellence of these tiles consists in their having a bond like slate, being proof against wind stripping and rain drifting, and in being easily put on. Special ridging is furnished. The number of tiles required to cover eleven squares is one thousand, and the weight of a square is  $7\frac{1}{4}$  cwt. The great variety of ornamental and garden pottery was, moreover, a feature of the exhibit, and it is not to be wondered at that amongst his prizes Mr. Matthews has carried off no less than ten silver medals for his excellent garden pottery.

*Hall's Patent Hanging Tiles.*

Mr. HENRY HALL, F.R.I.B.A., of 11 Doughty Street, W.C., the patentee, exhibited the patent hanging tiles. This most useful and ingenious system of tiling, so simple in application for walling purposes, will be found in use all over London—in hotels and restaurants, art galleries and museums, in railway stations and warehouses, in mansions and business offices, also in offices of the Government, besides numerous less pretentious buildings, shops, houses, &c. The tiles are used for facing old or new walls, and partitions in courts, corridors, or areas requiring extra light, or for shops, dairies, larders, &c. They are secured by nails driven into the joints of the brickwork, or in the case of a wooden partition they are nailed to battens or rough boarding, and they may also be fixed to fireproof work of concrete and iron. They are made 9 inches by 3 inches to course with brickwork, and in addition they are now to be had, as was shown at the exhibition, 6 inches by 6 inches, in the form of the square tile we see so often used in shops, dairies, baths, stables,

subways, &c. They may be had glazed white and of various colours, also with patterns stamped or in relief on the face. They are easily fixed by an unskilled workman, cannot fall off, and are not affected by fire or frost. The tiles are well known, and the ingenious way they overlap and conceal the nails, and result in a beautiful smooth wall surface, does not require explaining. Mr. Hall's name as the patentee, moreover, is quite sufficient that in them an article is produced fitted to fulfil the purposes for which it is designed. As to area covered, 1,000 tiles 9 inches by 3 inches cover about 21 yards, 1,000 tiles 6 inches by 6 inches, about 28 yards. Hanging tiles, red and unglazed, were shown at the stand of the Dunton Green Pottery Company, who manufacture them. The patentee has already secured a position at the forthcoming International Inventions' Exhibition (No. 443), where an opportunity of seeing the tiles, and the manner of their attachment, &c., will be again afforded.

*J. F. Ebner.*

Mr. J. F. EBNER, 51 Clerkenwell Road, E.C., showed beautiful specimens of his manufacture, types of which were noticed in the description of the Floral Hall Exhibition, and among the exhibits was a handsome wood dado, part of a general scheme of room decoration being executed. This firm have taken no less than twenty-three gold medals and diplomas of honour at all the chief exhibitions since 1847.

*Dunton Green Brick Works.*

A compact but exhaustive little exhibit of the thoroughly good building materials manufactured at the Dunton Green Gault, Red Brick and Tile Works, Sevenoaks (Mr. E. Breathing, manager), was shown at the stand of this firm, who may be said to be unique in one respect, that they have at their service a peculiarly excellent clay not found in any other part of the country, or indeed in any other part of Kent, a clay which comes out naturally from the fire of a creamy colour. Architects' specifications nearly invariably require it, and it is a speciality the firm are noted for, so that a

ASBESTOS PATENT FIREPROOF PAINT. All wooden buildings or erections should be painted inside and outside with this paint, as a means of protection from fire. All the wooden erections in the INTERNATIONAL FISHERIES and HEALTH EXHIBITIONS were coated inside and outside with this paint by order of the Committee of Directors. ASBESTOS OIL PAINTS, non-corrosive and very durable; suitable for Gasworks, Bridges, Roofing, Wharves, Waggon, &c., &c.

## FIREPROOF PAINT.

Sir FREDERICK BRAMWELL, C.E., F.R.S., Chairman of the Executive Council of the International Inventions' Exhibition, 1885, in referring to the preservation from fire of inflammable building materials, made the following remarks in his Presidential Address at the Institution of Civil Engineers, on January 13th, 1885:—

"The processes, more or less successful, that have been tried are so numerous that I cannot even pretend to enumerate them. I will, however, just mention one, the Asbestos Paint, because it is used to coat the wooden structures of the Inventions' Exhibition. To the employment of this, I think, it is not too much to say those buildings owed their escape, in last year's very dry summer, from being consumed by a fire that broke out in an exhibitor's stand, destroying every object on that stand, but happily not setting the painted woodwork on fire, although it was charred below the surface. I do not pretend to say that surface application can enable wood to resist the effects of a continued exposure to fire, but it does appear that it can prevent its ready ignition."

*Important Testimonials.*

LONDON OFFICES — THE UNITED ASBESTOS COMPANY (LIMITED), 161 QUEEN VICTORIA STREET, LONDON, E.C.

better recommendation could hardly be sought for. By the addition of chalk, any kind of clay could be made to come out from a creamy to a perfectly white colour. This clay neither requires nor receives any such addition. Though not found elsewhere, as said before, the particular clay is abundant at the Dunton Green Works, so that the supply is practically inexhaustible. There were shown at this stand the varieties of red and white (cream coloured) facing bricks and moulded bricks, plain and ornamental tiles, ridge, hip, valley and weather angle tiles, finials and terminals, besides garden edging and flower-pots. The brick, tile work, &c., is made in all patterns, moulded, &c. One aim of the firm among others has been to produce what is now so much in demand—a brick that will stand an enormous crushing strain. The red gault paving bricks are in great request for paving side walks. Any purposes or requirements that can be served by brick or tile work are met by the supply of a good durable material. A word of commendation is needed in respect of the smoothness in surface and the fineness of grain which is noticeable throughout. The tiles may be had of a somewhat porous nature, or, on the contrary, of a non-porous character, a tile quite equal to the Broseley or to fireclay machine-made pressed tiles; they, moreover, lie perfectly flat, owing to being manipulated in a dry state. Copings, string-course bricks, or terra-cotta could also be favourably judged of from specimens shown. The firm also are makers of the rebate hanging tiles, patented by Mr. Hall, F.R.I.B.A.

*Archibald Smith & Stevens.*

Messrs. ARCHIBALD SMITH & STEVENS, 48 Leicester Square, W.C., showed the patent (Stevens & Major's) "hydraulic" door spring and check applied to double-action or swing-doors, and also as applied to single-action doors closing into a rebate. This patent is a capital contrivance for closing doors silently and steadily, with or against the wind, without slamming. As seen in action nothing could well be more perfect. You are tempted to suspect that there must be invisibly present one of

the liveried attendants of some grandee, in whose mind hurry in closing a door, much more noise, slamming, violent action, &c., could only be associated with the beginning of chaos. The ordinary swing-door has many disadvantages, and among other things they are liable to catch you in the back, jam the fingers, &c., doing automatically what the railway guard does too often to unlucky travellers. An advantage of the patent is, moreover, that the mechanism is under the floor and makes no outward show. Many specialities were also shown in the way of patent door and window furniture, and ventilating appliances for rooms and buildings, railway carriages, for smoky chimneys, and for soil pipes, &c. Among locks was the patent "Bina'e" locks and furniture (Russell's), and Coale's patent "Levator" locks and furniture. The Binate furniture is made in one solid piece, so that the knobs cannot become detached by wear. The Levator furniture is pendant, and the action of raising it withdraws the latch bolt.

*F. H. Smith.*

A capital invention is to be found in "Smith's Patent Grip," a holdfast for fixing firmly and instantly the cords of Venetian and other blinds, ventilators, tennis nets, and indeed all purposes for which a cord holdfast can be used. It is exhibited by the patentee, Mr. F. H. SMITH, 52 Queen Victoria Street.

*George A. Wright.*

Mr. G. A. WRIGHT, 3 Westminster Chambers, Victoria Street, S.W., showed his patent improved fireproof fixing blocks, an imperishable material which forms a valuable substitute for wood plugging of every description, hitherto placed in walls in order to nail dados, match-boarding, skirting, &c.; or, to speak generally, these blocks may be introduced whenever it is necessary to nail or screw anything to brick, stone, or concrete walls, either in carpenter's, bellhanger's, or gasfitter's work, and they can also be readily snapped or cut with the trowel. They are built in the ordinary bond. In another form they do away with the necessity of putting skirting chocks into, and wood skirting

grounds upon walls. They are made for this purpose about three-quarters of an inch wider than ordinary bricks, offering for the plastering a similar, but, from the affinity of the respective materials, a better key than that obtained when using the wood ground. This size block may also be used with great advantage when walls are to be boarded, as in dados, wall-linings, match-boardings, &c., or where battened for lath and plaster, slate, or tile-hanging, &c. Among the names of architects who have lately specified the fireproof fixing blocks of Mr. Wright occur the names of Messrs. Isaacs & Florence, Mr. Ernest C. Lee, &c.

### NOTES ON NOVELTIES.

#### Armstrong's Patent Trapped Automatic Flushing Urinals.

Messrs. J. & M. CRAIG, Long Park Sanitary Pottery Works, Hillhead, Kilmarnock, have introduced an improved patent urinal. The Armstrong patent urinals have been specially designed to facilitate their periodic flushing, and the result is effectively attained in a manner at once most simple and inexpensive. The action is entirely automatic, and after once being set in working order, and the water supply adjusted to secure syphonage at the proper required interval, the process of intermittent flushing goes on with the utmost regularity. While the flush effectually carries everything before it, the apparatus is so constructed that there is always a quantity of clean water left in the basin sufficient to seal the trap (fig. 2), so that gases from the sewer-pipe may be thoroughly excluded and bad smells prevented. Where a constant stream direct from the water-main is not permitted, or where there is weak or irregular pressure, a small quick discharge syphon-cistern, with slight slow after-flush, may be used. This arrangement is found to work most admirably. The connection pipe from cistern to urinal should be not less than  $\frac{3}{4}$ -inch diameter. If the urinal waste discharges into a pipe on which is a non-ventilated trap, an air-pipe should be inserted somewhere between the

## BELLMAN'S PATENT GULLY.

*This Gully possesses the following advantages:—*

**Receives and disconnects one Rain-water Pipe and Three Waste Pipes.**

**Avoids all Splashing.**

**Ventilates the Pipes and Trap.**

**Forms Drain for Area or Surface.**

**Is easy of Access for Clearance.**

The ordinary P or S trap to be used in connection with Gully being in a separate piece, can be placed at any angle to meet the drain exactly, thus insuring a perfect joint, the Gully being fixed at right angles. This is a great advantage over other arrangements made with the trap in one piece.

*The Holes for Rain-water Pipes are made both Circular and Square and of various sizes.*

DESCRIPTIVE CIRCULAR ON APPLICATION.

**THIS GULLY IS HIGHLY RECOMMENDED by Authorities on Sanitary Matters.**

**PRICE AT WORKS, 8/6 EACH.**

Also SINGLE GULLIES, for Sink Wastes only, price 3/9 each.

**BELLMAN & IVEY, 95 Wigmore St., London, W.**

## THE INDESTRUCTIBLE PAINT CO., LIMITED, 27 CANNON STREET (corner of BREAD STREET), LONDON, E.C.,

Were awarded the GOLD MEDAL (highest award) of the International Health Exhibition, and the Diploma of Honour (highest award) of the Great International Fisheries Exhibition, for BROWNING'S PERMANENT PRESERVATIVE SOLUTION and PAINTS.

## ECK, CALLOW & CO.

**ELECTRIC BELLS. ELECTRIC LIGHTS. LIGHTNING CONDUCTORS.**

Estimates Free. Architects' Specifications specially attended to.

urinal and the trap. When desired, a treadle arrangement might be adopted, so designed as to operate on the syphon-cistern when the visitor steps off the treadle. The effect of this would be that the basin after having been used would be automatically emptied of its contents,

FIG. 1.

FIG. 2.

refilled, and left fully charged again with clean water (as in fig. 1). This being accomplished automatically, and with perfect certainty and efficiency, such an arrangement must commend itself as invaluable for railway stations and other public places. The same combination of action is not obtained by any other urinal in the market. The inlet to cistern should be as large as possible, so as to allow it to fill quickly. These urinals have been supplied (amongst other places) for several of the stations on the Great Western Railway; the Liverpool Docks; the Prince Alfred Memorial Hospital, Sydney, New South Wales; the new India Government Offices, London; and largely in America.

#### The Unitas.

This appliance, "The Unitas," manufactured by Mr. Thomas Twyford, sanitary potter, Hanley, is a front outlet basin and trap to serve the combined purposes of a water-closet, basin, urinal, and slop sink, with closet, basin, and trap complete. Unlike ordinary water-closet basins, it is not enclosed with woodwork but is fully exposed, so that no filth, nor anything causing offensive smells can accumulate

or escape detection. The outside of basin and trap having raised ornamentation, plain or coloured, the appearance presented is pleasing and artistic. No wood fittings are required except a hinged seat, which being raised, the basin can be used as a urinal or a slop sink, the wetting so objectionable in closets having permanent seats being avoided. Free access can thus be had to all parts of the basin and trap, so that everything about the closet can be easily kept clean. All joints and connections being in sight, any leakage or other defect can be easily detected and remedied. The basin and trap are constructed similar to the "Alliance," which was exhibited with the greatest success at the International Health Exhibition, South Kensington, 1884. The flushing arrangements are such that with a flush of 2 gallons of water, it is guaranteed that all the soil and paper will be completely removed from the basin and through the trap, the whole of the inside of basin being washed and sufficient water left therein to receive soil. It is recommended that this closet be used with a syphon cistern, chain pull and handle, and not less than 1½-inch flushing-pipe.

#### The Torbay Paint Company.

THE TORBAY PAINT COMPANY is a name well known for the quality of the paints they have put before the public for the last 30 years and more. The paints indeed seem to have given universal satisfaction wherever they have been used, and that they have not gone down in public estimation is shown by the continued use of them by the customers of the firm who have once tried them. It will not then be surprising to find that the "polish stains for wood," now brought before the public by the proprietors, Messrs. Stevens & Co., Torbay Paint Company, of Billiter Street, E.C., become universally used as they become known. These stains may be applied to any ordinary deal to produce the appearance of old polished oak, mahogany, and the like. The application of stains to produce in ordinary wood the rich effects of nature, as seen in walnut, rosewood, &c., is not a novelty, so that we are prepared to

hear of some special advantages gained by the use of these new polish stains. Among these advantages may be pointed out a saving not only in the first instance but in the after circumstances. In the first place there is a saving; no size or varnish has to be used. One coat only of stain is applied instead of as in other processes two coats of size, one of stain, and another of varnish. Then there is another saving in durability. For instance, they are of great value for borders of rooms, &c., as they do not scratch like ordinary varnished surfaces. And such borders may be used as well as looked at, for with considerable play of the feet on them by walking, standing on them, &c., the original gloss and finish is retained by an occasional rub up on the part of the housemaid. They, moreover, bring up the grain of the wood without concealing it, while imparting to it rich glossy tints, in exact imitation of the real polished wood, and not with an obtrusive glare like varnished surfaces. They dry quickly, and do not scale off like sized surfaces often do, nor is there the slightest difficulty in their application, as they can be easily put on by unskilled labour. They will be found exceedingly useful as a rich and ornamental margin for rooms, staircases, halls, &c. We may point out the economy in staining or painting the margins of floors, as the price of covering with Brussels carpet three quarters of a yard wide is about 4s. 6d. per square yard, while the cost of staining or painting would be about 1½d. per square yard, thus making a very inexpensive ornament or covering. They may be used for public buildings, asylums, schools, &c., being especially invaluable as a great preventive to contagious diseases; and Dr. Koch, in a recent lecture on the cholera, has stated that washing floors was not nearly so good a preservation as polishing and dry rubbing. They are also useful for wood dados, agricultural machinery, cabinet and joiner's work, and it is quite possible they will be unrivalled for effect, finish, and economy. As to covering powers, this depends somewhat on the porous nature of the wood, but on an average one gallon, it is stated, will cover about 80 square yards, one coat.

# THE GREAT PROBLEM OF THE XIX<sup>TH</sup> CENTURY. VENTILATION WITHOUT DRAUGHT.

The hitherto unsolved problem of "Ventilation Without Draught" is to be seen practically illustrated at FREDERICK HENRY SMITH'S Test Room, No. 68, 52 Queen Victoria Street, E.C., Patentee of the Automatic Siphonic Aspirator System of Ventilation. A personal inspection invited.

*Extract from the Annual Report of the "French Hospital and Dispensary," issued 29th January, 1885.*

We have also to return our best thanks to Mr. Smith, who undertook gratuitously to repaint one of our wards and to apply a new system of ventilation of his own invention, which was very successful.

*Letter from David Urquhart, Assistant Engineer to Colonel Sir Francis Bolton, C.E.*

F. H. SMITH, ESQ., 52 QUEEN VICTORIA STREET, E.C.

4 THE SANCTUARY, S.W., LONDON: NOVEMBER 22nd, 1884.

In reply to your inquiry, I have much pleasure in certifying that your system of ventilation as applied to the "Island Room" of the illuminated fountains at the Health Exhibition reduced the temperature during the displays from about 110 deg. to about 70 deg., and thus enabled the men to perform their duties without inconvenience.—Yours faithfully,

DAVID URQUHART.

*Extract from the TIMES of March 14, 1885, page 7.*

"VENTILATION WITHOUT DRAUGHT.—This desideratum appears to be accomplished by a syphonic system devised by Mr. Frederick H. Smith, at whose offices, 52 Queen Victoria Street, London, we recently inspected the arrangement. The air supply is conducted into the apartment from the external atmosphere by means of air ducts, which terminate in distributing passages at the floor level. The exit for the vitiated air is placed in the ceiling, and consists of two tubes, a large and a small one, running parallel to each other between the floor joists in the case of rooms having others over them. In the case of rooms on top floors, or those having the roof directly over the ceiling, the tubes are placed concentrically, but the action and results are the same. The larger of the two tubes carries off the vitiated air, while the smaller one forms an induction tube for cold air, its outer extremity being open to the atmosphere. These two tubes or conduits are so connected that the passage of the heated air through the larger tube induces a current of cold air through the smaller one in a continuous stream. The result is a rapid clearing away of all deleterious gases and products of combustion as they accumulate, and the preservation of a pure atmosphere at an equable temperature in the apartment. In a small room at Mr. Smith's offices in which five large gas-jets were burning, the atmosphere was apparently quite innocuous at the level of about 7 feet, the temperature being about 60 deg. Fahr. At a higher level, however, and especially near to the ceiling, the temperature was high and the air greatly vitiated. It was demonstrated that this vitiated air was being drawn off through the exit tube, which acted as a powerful sucker. After turning off the gas-burners, and upon the temperature of the room generally becoming lowered and equalised, a feeble upward action was still maintained in the upcast tube, but there was no down-draught whatever. The system has already been applied to a church and other buildings with acknowledged success."

## ART PLATES FROM "THE ARCHITECT."

Proof Impressions of the following Illustrations which have appeared in "THE ARCHITECT" can now be obtained in a separate form suitable for Framing:—

## The Martyrdom of St. Stephen.

BY E. J. POYNTER, R.A.

Awarded the GOLD MEDAL at the International Health Exhibition

Size, Forty Inches by Fifteen Inches. Price One Shilling; by post, carefully packed inside patent roller, One Shilling and Threepence.

## SHAKSPERIAN DECORATIVE PANELS.

BY H. STACY MARKS, R.A. (Printed in Colours.)

1. Scene from "The Tempest."
2. Scene from "Midsummer Night's Dream."

3. Petruchio and the Tailor.
4. Falstaff in the Buck Basket.
5. Touchstone, Audrey, and William.

6. Falstaff acting the King.
7. Parolles' Eyes Unbound.
8. Malvolio in the Garden.

Price One Shilling; free by post, carefully packed inside patent roller, One Shilling and Threepence each; or the set of Eight, Five Shillings; by post, Five Shillings and Sixpence.

## The Banquet.

The well-known and beautiful Chromo-lithograph by H. STACY MARKS, R.A.

Size, Thirty-nine Inches by Fifteen Inches. Price One Shilling; free by post, carefully packed inside patent roller, One Shilling and Threepence.

# The Architect.

## THE WEEK.

THE important compensation case in which Messrs. SOMMERVILLE & Co., of Greenock, claim 80,077*l.* from the Glasgow and South-Western Railway Company, for losses arising from the construction of an extension line on their property, has been commenced in the local Sheriff Court. The area of the dry grounds and ponds for storing and seasoning timber is about 38,753 square yards, and at 26*s.* or 27*s.* a yard the value amounts to about 50,000*l.* in round numbers. The buildings are put down at 14,000*l.*, and the depreciation of business is estimated at 18,000*l.* The Railway Company offered 55,000*l.* for the whole right and interest in the property. According to the evidence of Mr. R. G. SOMMERVILLE, the profits of the mill rose in one year to 19,764*l.*, and in 1880 they were 13,000*l.* The total profits between 1865 and 1882, after deducting two bad years, was 78,151*l.* 2*s.* 2*d.*, or an average profit for these years of 4,341*l.* 14*s.* 6*d.*

AN exhibition of works which have been rejected at the Royal Academy and the Royal Institute of Painters, is to be opened at the Crystal Palace on May 19. It will not be closed for about six months. Architectural designs, water-colour and other drawings are admissible. They will be conveyed, free of charge, from the exhibitions to Sydenham, and are not to be subjected to further examination by a committee. Other works will be delivered if left at 221-233 Fulham Road, but will have to be submitted to a committee. A commission of 10 per cent. will be charged on works sold during the exhibition. A free non-transferable admission ticket to the palace during the exhibition will be granted to each exhibitor. All pictures and drawings must be in gilt frames. Preference will be given to gilt mounts for water-colours. Oval frames are inadmissible. The honorary secretary of the exhibition is Mr. HENRY VAUGHAN, 60 Finborough Road, S.W. Mr. W. WHITE represents architecture on the committee.

THE contractors for the Forth Bridge have reason to complain of the way they have been impeded by the various local authorities who can claim an interest in the land or water. Instead of considering the work as a public benefit, which it was their duty to aid, they have endeavoured from the first to invent all sorts of petty annoyances, in the hope of screwing money out of the firm. The latest attempt is in relation to the laying down of rails to convey materials along a road at Inverkeithing. A neighbouring landowner says the road is his, the Town Council claim it as theirs, and the contractors are threatened with one of those actions which seem never to come to an end, unless they acknowledge the right of the burgh to the road, which means a similar action from the proprietor for denying his right. Between the two it is difficult to select a course. The contractors have put up staging, and the Town Council wish to have it made over to them. In cases of this kind a despotic authority to control local bodies does seem to be a desirable institution.

THE London Water Companies in 1872 supplied 497,736 houses, for which the sum of 948,277*l.* was paid. In 1883 the houses had increased to 659,249, while the payments rose to 1,505,057*l.* It will be evident that while the increase in the number of houses was 32.4 per cent., the proportion was much greater as regards money, rising from a rental of 948,277*l.* to 1,505,057*l.*, being 58.7 per cent. The Southwark and Vauxhall Company present the most remarkable of the differences. The increase in houses in their district was 27.5 per cent., while the water rentals ascended 73.9 per cent. The explanation given by the companies is that the houses newly erected are for the most part of a superior class; that those rebuilt are generally much larger than those which they replaced; that in many cases, owing to works of public or private improvement, two or three houses have been converted into one; and

that thus, while the number of houses in the most densely populated parts of London has diminished, the value of property has increased commensurately with the increase in size. But the most extraordinary feature of the case is that six out of the eight companies have supplied a less amount of water on an average to a house in 1883 than in 1872. The Southwark and Vauxhall Company, with an increased rental of 76,313*l.*, supplied 168 gallons a day in 1883 against 171 gallons in 1872. The Grand Junction delivered 238 gallons per house in 1883 and 279 in 1872. But the water had evidently become more precious, for while the householders paid 92,168*l.* for the larger quantity, they were compelled to pay 150,015*l.* for a reduced number of gallons. It is not surprising that between 1872 and 1883 the fortunate shareholders were paid eight and a half millions in dividends.

THE exhibition of students' drawings which were shown in the Chiswick School of Art, Bedford Park, this week, was very satisfactory, and creditable to the director, Mr. BURCHETT. The school has not long been opened, and it is too soon to expect that the *esprit de corps* which does so much to supplement a teacher's labours can as yet be influential. But it is evident that the students are making such great efforts to create the spirit that in a short time they must be successful. The teaching has the advantage of retaining whatever is best in the South Kensington system; but many of the qualities of foreign systems are also introduced. If no means had been adopted to bring out the individuality of the students, the school could not exist amidst so many critics as are to be found in Bedford Park. The drawings of the students are a testimony of the thoroughness of the training in the different stages.

THE Artists Corps was distinguished this year at the Easter Review, but that is annual experience. The Commander-in-Chief audibly expressed approval of the appearance of the ranks at the march past. The military correspondent of the *Times*, who met the detachment of the corps under Lieutenant HORSLEY at East Grinstead, has testified to the soldierly bearing of the members. "I was struck," he says, "by the silence and steadiness with which the detachment fell in before recommencing their march. Veterans of the regular army could not have been more quiet and orderly. Indeed, any one looking on might well have thought that the grey-clothed soldiers before him belonged to a regiment of wandering Jews, and had passed their lives on the march. They are of good physique, these Artists, and I learn that few men under 5 feet 6 inches are accepted. Even, indeed, if a candidate is a proper man of his inches, he cannot be enrolled unless recommended formally by a member of the corps. There are several peculiarities about this regiment: one is, that almost all the officers have begun as privates in the corps, and have risen gradually through the different grades of non-commissioned officer; another is, that the corps supplies from its non-commissioned officers a large number of officers for other corps."

A REPORT has been presented to the Senate of the United States on the best way to preserve the Falls of Niagara from further spoliation. It proposes the reservation of several islands and all the points from which the Falls are visible, which are now fenced in and admission charged for entrance. Messrs. MARSH, HALE, and PRATT were named by the Supreme Court as appraisers of this property, and the total sum of their awards is 1,433,000 dols. This appraisal the Supreme Court affirmed. The appraisers examined carefully the claims of riparian owners to rights in the hydraulic power and the bed of the river, for the surrender of which compensation was asked. The owners were prepared to put in claims for 20,000,000 dols. for these water rights, but the appraisers ruled out all such claims except where water power had so long been used as to be a prescriptive right, on the ground that Niagara belongs to the State. The aggregate of the claims presented reached 4,000,000 dols., but the awards were only one-third that amount. The Legislature will now be called upon to appropriate the money to secure the land.

## THE BLESSINGS OF FASHION.

WHATEVER may be the demerits of Queen Anne, the style has been the means of giving an immense amount of work to people in many parts, not only of England, but of the world. We can see proofs of this in any building exhibition like those which were lately held in Covent Garden and Islington. The Gothic Revival did much for trade, and especially in expensive metal work and stained glass. But Queen Anne has given an impetus to the subsidiary arts which, for vigour, has been without precedent. If the things in the exhibitions which owed existence to that style were turned out, very little would be left for the visitors to gaze on. Declare Queen Anne illegal, and the effect would be felt not merely in Birmingham brass works and East End furniture manufactories, but by children who assist in making fans and screens in Japan, and by Indian weavers. Manufacturers are not grateful or they would, before now, have proposed the erection of a statue of Mr. NORMAN SHAW, as a recognition of the advantages which they have been deriving for several years past, and which, directly or indirectly, can be attributed to the revolution which he inspired.

It is only when one considers the importance which is now attached to furniture and decorative appliances that the change in the position held by architecture becomes apparent. Many people at the present day look on the builder's work as little more than a means of displaying manufactures of various kinds. What resident in a suburban terrace cares about the quality of the timber in a door if it contains thick coloured glass which will shed a soft lustre in the hall, or thinks of the thinness of a partition wall if it be covered with a paper that is considered correct? With the aid of terra-cotta, tiles, brass door furniture, a little stained glass, good wall-paper, a couple of carved capitals, electric bells, and paint, it is astonishing how much can be done by a certain class of builders to make houses alluring. If, in addition, there is a sort of guarantee that the sanitary arrangements are of an advanced class, the houses are pretty sure to find purchasers or tenants unless rent or neighbourhood forms an obstacle. Sanitation and showiness are now the watchwords of house-seekers.

It is not only houses of a cheap class that are constructed on the principle of making showiness the more important element. We believe it will be discovered that one of the causes of the failure of so many builders is to be found in speculations having for their object the erection of very large and very imposing houses, for which high rents are indispensable if there is to be any interest on the outlay. People who can pay liberally are disposed to hesitate at the present time before they invest in buildings, and the speculators suffer in consequence. It may, however, be worth inquiring whether the builders have not read the signs of the times with skill. Is there any reason for supposing that one style of house is more preferable to the public than another?

We think it will be found that people in our time are more eager to seek after novelty in everything than their fathers were. The days are departed when good folks could be happy, like the PRIMROSE family, with adventures by the fireside and migrations from the blue bed to the brown. We are restless, as if quicksilver had found its way into our blood, and demand change of scene perpetually. External objects pall upon us, let them be ever so lovely, and the discoverers of new scenes, like the inventors of new games, are respected as public benefactors. If Dr. SCHLIEMANN had spent a few years in seeking for columns and fragments of architecture in Athens few would care for him, but the unearthing of a pre-historic city in an unexpected place, and of ornaments that were a little peculiar, has been sufficient to spread his fame over all lands. Let him turn his attention to Ephesus, and as nothing novel is to be anticipated there he would secure no more than a languid attention given to his work. Life to be enjoyable must resemble the kaleidoscope: however beautiful the pattern may happen to be, we are not sorry when it is transformed into something that is different.

In architecture there has been at all times a struggle between those who seek after newness and the upholders of the old. What are the changes in style but signs of the

victory of the former? Early English is most charming, but it was superseded; Perpendicular did not equal Decorated in the beauty of its lines, but it had in its favour the agreeableness of novelty. Critics wonder how it was possible that Chinese and Egyptian forms should be attempted in England, forgetting that monotony in any shape becomes wearisome, and that philosophers would in time grow tired of the regularity of Harley Street and Gower Street.

It is one of the virtues of Queen Anne that it gives more opportunities than most other styles for the introduction of novelty. A building that in its unity resembles "an entire and perfect chrysolite" cannot be tampered with. There are severely Italian and Gothic houses in England in which it would appear indecorous to use paint of a different colour, and a Japanese cabinet or a Sèvres vase would seem to be rebuked in the drawing-rooms. But with Queen Anne nothing seems out of place that can be called beautiful. It accommodates itself to all changes of fashion with the ease of a grand dame. The consequence of so much adaptability is that there is more scope for invention in what are called the subsidiary arts of architecture. Compare a modern pattern-book of wall-papers, metal-work, furniture, textiles, with a corresponding one representing the trade of less than twenty years back, and the difference will be apparent. Opinions will of course vary about the value of the art, and the geometrical conventionality will be pronounced superior to the license of our time; all we say is that there are far more patterns required now, and they mean more profit to the producers.

It was a fiction at one time that the king never died, and a like character was assumed by architecture. All forms were supposed to be permanent when they were produced. There is no claim of that kind put forth on behalf of the style which is in vogue. It acknowledges the claims of fashion, and, so long as the fabric remains, allows of the substitution of sufficient features to satisfy the most whimsical. There is unfortunately a notion that architects care but little for the things which give so much character to a house, but which are almost as variable as the dress of the owners. They leave the finishing to the owner's taste, and he finds a tradesman who will not only decorate a building, but is prepared to undertake the whole of the work in the one which the owner contemplates erecting. This is no unusual occurrence. The only way to avoid it is to retain the supervision of every class of work from foundations to gasfittings. "Monumental architecture," which no more recognises pattern-books than plates of the fashions, is suggestive of something that is very grand, but in these latter degenerate days it has lost much of its power. The builder does not always recognise it when he speculates on his own account, and the men who purchase the houses from him feel that he is a kindred spirit, for the great city of London would collapse if endurance were given to the objects which are bought, sold, and exchanged.

## PECKSNIFF: A STUDY OF DICKENS.

[BY A CORRESPONDENT.]

WHEN, on the advice of certain wiseacres, my parents resolved to make an architect of me, I rebelled against the arrangement. The cause of my opposition will be thought trivial and foolish. I had been reading "Martin Chuzzlewit." In my ignorance of life SETH PECKSNIFF and his clerk, TOM PINCH, were taken as types of the profession, and neither was attractive. It will, I know, give my readers a low opinion of my judgment in other things besides the *belles-lettres* when I confess that I despised the angelic Tom even more than his master, but I supposed that he was a product of office work, and I was too proud of my appearance to be ambitious of holding the position of assistant when the price was a bald head, weak eyes, and a general absence of muscle. I was without any skill in music, and I felt that I was not to have the compensation of becoming like the figure in the frontispiece to the book, that is seen playing on an organ and surrounded by crowds of delighted spirits. I have outlived a good many prejudices, but my aversion to Mr. PINCH is not one of them. I think there was an excuse for the playful MERCY when she made fun

of him. He is too limp and gentle for this world of ours, in which, as the Frenchman says, "Le faible est destiné pour servir le plus fort."

It might have been better for myself if my fancies had been considered, and probably the world would have revolved as smoothly on its inclined axis if I had never drawn a plan. But grown people are not disposed to attend to youngsters' feelings about education or business, and, like many a fellow before and since, my position was fixed for me, and I was left to get over my dislikes with the help of time. My fee was paid, and I believe something was promised on my master's part which it was nobody's business to see carried out. What he knew or could teach is not now in question. If he were less competent I should still revere his memory, for in the course of the first week I saw very plainly there was nothing in common between him and PECKSNIFF. Fragments of intelligence from offices in the town and elsewhere reached us occasionally, and I was astonished to find that however keenly my fellow pupils criticised architects, I could hear of nothing to correspond with what I had read in the novel.

Since then I have met with many men whom, according to custom, I was expected to recognise as "professional brethren," although very little fraternal affection was exhausted among us. I have had my share of failures, which were not always, I think, a consequence of fair play; and I have suffered when I saw the airs taken by architects who were more successful than myself. But I have no hesitation in saying that, however much I may have been biassed against rivals, in not one among them, in town or country, could I recognise the Pecksniffian lineaments. If it be a portrait, it is from an exceptional piece of inhumanity, and thank heaven it is not generic. We know that DICKENS had some little skill in catching a likeness when there were subjects before him, as in the case of lawyers. DODSON and FOGG; the promising junior, Mr. SKIMPIN, aged forty-three; the venerable Mr. Justice STARELEIGH, who took so many notes with a pen without any ink in it; the oppressive TULKINGHORNE, who stalks about like Fate in a Greek tragedy; tall Mr. WITHERDEN, who introduces "sir" so often in his discourse; the genial judge who examines the wards in "Bleak House"; SAMPSON BRASS, of Bevis Marks, and the rest, are not entirely grotesque phantoms. Architecture comes so often into contact with the High and Low Courts of THEMIS that we must all have met characters who have had resemblance to them. They are caricatures, but we see a likeness. But PECKSNIFF? Can the most aggrieved client, who is wrathful when he finds that his "fads" have to be expressed in pounds sterling, and that the alteration of a plan means the drawing of cheques—can the most irascible of builders, who sees a big bill of extras dwindle slowly away, like the sand in a hour-glass, dare to say that the architect who causes all the woe is a second PECKSNIFF? Emphatically I say no, and I defy all our enemies to support the novelist.

It is often supposed that Sir WILLIAM TITE unconsciously sat for PECKSNIFF, in the same way that HAROLD SKIMPOLE was modelled on LEIGH HUNT (to the dishonour of DICKENS), and the blatant alderman in "The Chimes" was suggested by Sir PETER LAURIE. If so, the portrait does little credit to the artist's eye or hand. I have had opportunities of observing TITE in three of the parts in which he acted during his later years, that is as a legislator, a scholar, and a magnate of the Institute. From what was said against the man, there was a lurking suspicion in my mind that perhaps PECKSNIFF was not entirely an imaginative being, and I own that I was disposed to make the worst of anything I saw and heard. But although there were weaknesses enough about Sir WILLIAM TITE, there was no trace of the Pecksniffian meanness or dishonesty. He might have served for the Shakesperean justice, although he wanted the formal beard, for he was good capon lined, had eyes severe, and abounded in wise saws and modern instances, but not one of the novelist's characteristics will suit him.

I saw TITE, as I have said, under three aspects. There was a Bill relating to the town in which I then lived, which came before a Committee of the House of Commons on which TITE sat. His shrewdness and experience in all matters relating to works made him a formidable power in such a case and one of the counsel resented his interference

and display of technical knowledge, with the exaggeration that is common on occasions when lawyers wish to make out that their clients are not receiving justice. A man with any grain of Pecksniffism in him would have raised capital from the scene, either by standing on his dignity as a member, or by appealing to his antecedents, but Sir WILLIAM took it all in right good-will, and he expressed himself so gently in his explanation, and was so apologetic for having given occasion for remarks, that I think the counsel and his clients were satisfied. If not they should have been. That was the only occasion on which I saw TITE acting as a legislator, and I was impressed by it in his favour. How did he appear in the rôle of a scholar? PECKSNIFF, we know, utilised books as properties, and, as he waved his hand towards them, would say:—"Various books, you observe, connected with our pursuit. I have scribbled myself, but have not yet published." Sir WILLIAM was the owner of many books of a valuable kind on subjects outside his profession, and he had that knowledge of bindings, editions, dates, and title-pages which appears to be of little consequence when possessed by a dealer, but becomes mightily impressive if acquired by a wealthy amateur. Sir WILLIAM's imperious manner and deep voice, with Lady TITE always ready as a reference (for book-hunting seemed to be a pursuit in common), made it risky when a man hesitated about accepting his opinion on a literary subject. There was sure to be a shaking of heads, with other signs of sapience among the people present, which showed that Sir WILLIAM expressed the opinion of the majority. We all admit there is no royal road to learning, but in many London drawing-rooms it is supposed there is a golden one, and that money brings omniscience among the blessings in its train. If a reverse of fortune had come upon Sir WILLIAM, I doubt if he would have been competent to undertake a professorship of classics or literature in any form, but he possessed sufficient knowledge to make a safe librarian. In Conduit Street he was always impressive, and he had the conviction that his power was recognisable. To my irreverent eyes he was an interesting object. One has to be born an artist, while the humblest man in the room could feel that it was only necessary for Fortune to be gracious, and he was competent to hold such a position as TITE's. He obtained the respect which a man whose signature is good for six figures can claim by right, and he looked as if he were conferring a favour by bringing a golden atmosphere to the meeting. In my own mind I have likened him to "JOVE in his chair" in the old burlesque, and sometimes the scene has suggested LANDSEER'S *Laying Down the Law*, but no freak of fancy could bring the meeting into association with the novel. His enemies might say that TITE was garrulous, purse-proud, conceited, and opinionative, but with all his faults and foibles he was not a sneak like old PECKSNIFF.

I have descanted at too great length on Sir WILLIAM TITE, but it is worth remembering that DICKENS went out of his way to imply that there was a PECKSNIFF in flesh and blood about 1844, and only one name has been suggested as having a title to so much dishonour. "Mr. PECKSNIFF will by no means concede to me that Mr. PECKSNIFF is natural," wrote DICKENS, and he explained this want of recognition by the architect of his own portrait by saying "that no man will admit the correctness of a sketch in which his own character is delineated, however faithfully."

Having said so much, it is now time that we should consider PECKSNIFF without any reference to an individual. I do not propose to touch the creation, except as it is put forth as a representative of architects in general. The poet in the TODGERS' establishment spoke of the Tritons flocking round the bark of PECKSNIFF (meaning the stage coach), and admiring "The Architect, Artist, and Man." I have nothing to do with the man in his private capacity, as an aspirant for a share in the family plate and silver spoons of the house of CHUZZLEWIT, and as a type of the respectability that keeps a gig.

I think it may be premised that DICKENS could have had no knowledge of his own about architects and their doings. He was not much of a patron of the arts, and, so far as I can discover, none of his wealth was expended on building. For a time I believe he was an underling in a lawyer's office, and from SWIVELLERS and CHUCKSTERS may have derived information which he was afterwards able to utilise. There was no such clue to architects' misdeeds.

It is now apparently impossible to discover what induced him to meddle with a subject like architecture. I have imagined that it was a suggestion of HABLOT BROWNE'S, the artist who did so much to build up DICKENS'S reputation, and with how much ingratitude every one knows. BROWNE was to have been an architect. Some of his etchings denote much skill in representing buildings, but he was too gentle a man to take a part in the collisions which practice entails. I have often thought that the description of TOM PINCH is not unlike him in some respects, just as the sketches of PEGGOTY are a counterfeit presentment of "PHIZ" at a later time. Wherever the suggestion or information came from, DICKENS was incompetent to give it an appearance of reality.

We see this from the first. Mr. PECKSNIFF'S brass plate announced that he was an architect. We are told, however, that "of his architectural doings nothing was clearly known, except that he had never designed or built anything; but it was generally understood that his knowledge of the science was almost awful in its profundity." In London and in one or two large towns in the provinces it is possible for any man who owns a hall door to screw a plate of the kind upon it. But could such an announcement appear in a Wiltshire village, within a mile or two of Salisbury, without risk to the advertiser? I think not, for in the country opinion has a force which is apparently unknown to Londoners.

PECKSNIFF could hardly escape detection. He is supposed to have trafficked in pupils, but the young fellows—all of whom, we are informed, went away with the conviction they had been swindled—would have proclaimed in the village alehouse, as well as in Salisbury, that buildings were never entrusted to their master. A little knowledge of the profession would have shown DICKENS that architects, when work is scarce in their offices, hesitate about bringing in a strange pupil and thus to run the risk of exposure.

It was probably the author's intention to have exposed the system of attracting pupils by means of advertisements, as he had before exposed the Yorkshire school system. An eligible opportunity, practical education, comforts of a home, moral responsibilities, and the like, which were the elements of the advertisements, have through the novel fallen into disrepute, but they are desirable things if they can be secured. A fee of 500*l.*, with 70*l.* a year, which JOHN WESTLOCK is supposed to have paid, would not be too high a price for them. But it was irrelevant for DICKENS to introduce the fee system, since MARTIN CHUZZLEWIT is taken without payment. He wanted, however, an opportunity for a gibe at the profession, and was willing to sacrifice unity to gain it.

The extent of DICKENS'S acquaintance with architectural subjects is evident from the description of the pupil's first appearance at the office. He finds PECKSNIFF "surrounded by open books, glancing from volume to volume, with a black-lead pencil in his mouth and a pair of compasses in his hand, at a vast number of mathematical diagrams of such extraordinary shapes that they looked like designs for fireworks." Is not the comparison excruciatingly funny? DICKENS had seen, we suppose, some engraved plans of a Gothic church, with lines showing groining, and to his cultured intellect they suggested a catherine-wheel! Is there any other country where a man of genius would venture on such a comparison, being assured that it would serve, since his readers were more ignorant than himself? But the views on the walls of the office were, if possible, more absurd to an exalted mind of the cockney kind than the fireworks plans. Mr. PECKSNIFF points to them in his grand way:—"Salisbury Cathedral from the north; from the south; from the east; from the west; from the south-east; from the north-west." The English public will laugh at the inventory, just as the French still titter at the strange names of theologians recorded by PASCAL. To have drawings made of a fine building like Salisbury Cathedral, from many points of view, was, to DICKENS and his readers, not merely an absurdity, but a proof of dishonesty. What more need be said to prove PECKSNIFF'S guilt? In the very beginning of the story he is shown to be a rascal by the mere fact of possessing six different representations of one cathedral, which are as bad as the separate parts of a coiner's apparatus. Henceforth the way is made easy for the novelist to pile on crimes until PECKSNIFF becomes "a drunken, begging, squalid, letter-writing man." It is clear

that DICKENS had not studied criminals in the Old Bailey for nothing.

Young CHUZZLEWIT was deficient in all kinds of knowledge that might be useful in an office. But on the first morning, without a word of instruction, he is set to work out a competition design for a grammar school. "Who knows," said Mr. PECKSNIFF, "but a young man of your taste might hit upon something, impracticable and unlikely in itself, but which I could put into shape? For it really is, my dear MARTIN, it really is in the finishing touches alone that great experience and long study in these matters tell." If JOE GRIMALDI (of whom DICKENS was the biographer) talked and acted in this strain at Sadler's Wells, the gallery might well laugh, but when put forth as a representation of an architect's way of doing business it becomes a very dreary attempt at humour. The climax of the absurdity is reached when afterwards in the story we discover that MARTIN'S marvellous design did gain the prize, and was to be carried out with great applause. Need we wonder that the English people look on architecture as something which anyone can take up at a pinch when a teacher like DICKENS can give so ridiculous a picture of the production of a design? It is believed, too, that works which abound in statements no less unfounded are worthy to descend to posterity as records of English life in our century.

The pupil is advised to combine building with his drawing, and here is how architects are supposed to gain practical knowledge:—"There are a cart-load of loose bricks and a score or two of old flower-pots in the back yard. If you could pile them up, my dear MARTIN, into any form which would remind me on my return, say, of St. Peter's at Rome, or the Mosque of St. Sophia at Constantinople, it would be at once improving to you and agreeable to my feelings." It is sad to think that it is from rubbish of this kind the English people draw their notions of our work. DICKENS did not esteem us, and it is not surprising that when he had to describe the peculiar rooms in a water-side tavern, where TAPLEY and MARTIN dined, he said they were produced "by reason of the facilities afforded to the architect for getting drunk while engaged in their construction."

One of the mysteries of the book is the introduction of architecture. It has so little relation to the story that PECKSNIFF might be transferred into any other business without affecting the action and plot. DICKENS was most defective in construction; but in all his books I don't know of anything that has less purpose than the architectural element in "Martin Chuzzlewit." The meaning of it all may one day be revealed.

It is perhaps a waste of paper to continue the analysis of such a book. But I feel it has done harm. It has created a phantom which, from the popularity of the writer, is accepted as a veritable portrait, and every puny fellow who can hold a pen is safe to slander honourable men under the authority of CHARLES DICKENS.

## COLONIAL ARCHITECTS.\*

AT the present time, when the Colonies have assumed increased importance, the publication of a new edition of Messrs. Street's invaluable directory is most opportune. It is so full of information, and is so comprehensive in character, as to become indispensable to all who have business of any description with one or other of the numerous English colonies. In addition to the lists which are usually found in directories, we have statistics derived from the latest returns, and nineteen excellent maps. The book has consequently a claim to be considered a colonial gazetteer as well as a directory. From the pages we may derive a notion of the state of the building trade.

India takes the first place. Calcutta we are told contains dirty streets and mean houses in the native portion, whilst the European part has given rise to the title of "The City of Palaces." There are eleven names of firms put down as architects and surveyors, but we find that eight of them appear among the builders, and nearly the same number among the engineers and contractors. The condition of things is suggestive of what takes place in other parts of the Colonies, and it is evidently essential that every man who is desirous to set up as an architect should be possessed of practical knowledge. In Calcutta the only Eastern name among architects is "Ali";

\* Street's Indian and Colonial Mercantile Directory for 1884-5. Tenth Issue. Street & Co.

but among the dozen firms in Bombay that represent architecture, building, and contracting, we find such names as Naggoo, Syajee & Co., and Raghunath Muccrondas. Building in Madras has three representatives. In several of the lesser towns we also find Indians as builders and contractors. Simla has two British architects, and five contractors have found their way to Gubbulpore, a modern town with "public buildings, well situated, and constructed with taste." Ceylon evidently depends on builders of a humble class, for there are no names of them in the directory.

Hong Kong possesses two firms of architects and surveyors, while Shanghai, although apparently without architects, has nine civil engineers. There is an architect in Foochow, one in Yokohama, and one in Tokio. In the Island of Mauritius the people are apparently so intent on litigation that there is no time for building. About sixty attorneys and thirty barristers-at-law find occupation, and as there are a dozen land surveyors we suppose the fields are always changing owners to defray law costs. With sixty physicians and surgeons in addition the island must be in excellent pickle.

Melbourne, according to the directory, "abounds in edifices which rival those of the older capitals of Europe," while "the buildings devoted to the purposes of trade are, many of them, of a superior order, and some will vie with similar places in the cities and towns of Great Britain." There are about eighty architects' names entered in the directory. Ballarat has eight, Belfast three, Castlemaine two, Geelong four, Sandhurst two. Sydney has a population of 250,000, but it seems to have a larger proportion (over one hundred) of architects and surveyors than most towns in the Colonies, while the builders fill more than three columns. This may be partly owing to the Improvement Board having "caused a revolution by condemning old and unsafe tenements in every direction."

In Melbourne we find about a dozen architects. Brisbane has eight. New Zealand somehow has done less for the art than the sister colony in the southern ocean. The population is not one that dwells in towns. Wellington has only eight architects and surveyors, and in Auckland there are five. In Christchurch we find more signs of improvement. "The wooden buildings, of which the city was almost entirely constructed originally, are now rapidly giving place to brick and stone edifices, many of them of an exceedingly handsome and stately character;" and as intelligence of the transformation must travel quickly, over twenty architects are now to be found in the city. As a rule, there is one architect to 10,000 inhabitants in the Colonies, but in Christchurch the proportion is about one to 1,500. In Timaru there are seven architects and seven builders for 4,000 people. Nelson has only four. Dunedin is another progressive city, but with eleven builders there are twenty architects. Tasmania is backward in the arts, for there are only half a dozen architects in Launceston and Hobart Town. As yet, no member of the profession appears to have found his way to Fiji. Turning to Africa, we see that Cape Town has eight architects. Port Elizabeth, although much smaller, has seven, while East London and Grahamstown have each four. Durban has two.

Canada hardly appears to be so well supplied as might have been anticipated. Montreal, with a population of 170,000, has only about twenty architects. Among them we recognise such French names as Perrault, Baudry, Mesnard, Roy. In Ottawa we find five, in Quebec nine (nearly all have French names), while Toronto has over forty; but it should be remembered that it is a church-building city, and has 106 churches. Hamilton is another go-a-head place, with nine architects. London, which fifty years ago was a wilderness, has nearly a dozen architects and three "artists." Halifax has six, and the same number is found in the remote Winnipeg.

The directory gives information respecting countries in South America with which England has business transactions, and with such a book before them it is not surprising that foreign Governments should become emulous of competing with us for distant markets.

### ART LOGIC.\*

By LAWRENCE HARVEY, A.R.I.B.A.

IN schools we are taught to read and write correctly our own language; but although we may have mastered the mysteries of the subjunctive mood, and escape the pitfalls of the double negative, that does not make us writers like Dickens, Thackeray, or Lord Tennyson.

The main difference between these great men and the well-trained schoolboy is not in the knowledge of language, but in another element called brains.

What I have said about language holds good with the arts

taught in this school. You all know the answer of a great painter to his pupil, who was asking him with what he mixed his colours to produce a certain effect—"Brains, sir." Brains mean the power of thinking, and thinking cannot be done without logic, which is the art of thinking. So, however distant the words "logic" and "art" may seem at first, you see full well they are closely united in every great work of art, and justify the title I have given to this lecture.

I am aware that amongst artists logic is at a discount, for artists hate to have their works analysed like mathematical problems. Many of the disputes of men arise out of the poverty of our language: people often fight tooth and nail because they misunderstand one another. Popularly the word "logic" is restricted to the art of thinking when applied to geometry, where we deal with dimensions and quantities. This branch of logic, peculiar to mathematical sciences, of course fails when applied to man, his institutions and his works; for there are not two men absolutely alike, and, moreover, the same man is not two moments alike. At the one time he will take as a compliment what at another time he will resent as an insult. This is embodied in the well-known practical advice of men of business, that you must see a man after dinner when you have a favour to ask.

On account of the restricted meaning generally given to the word "logic," I am not surprised to see artists hate it; but, nevertheless, every artist, as well as every statesman and man of business, has a way of reasoning out what he does or says—*his own peculiar logic*.

It would probably help artists very much if the great masters who have preceded them had left a written record of the logical arguments they applied to their work. But artists are not prone to write down their reasonings, because they take place so suddenly and rapidly that they could not easily find words to express them; they prefer, therefore, to mystify the public and themselves by attributing what they do to some mysterious supernatural power, which they call "inspiration," or, as the Greeks put it, to the goddess Minerva, who benevolently whispers in their ear what they must do.

When, by some rare chance, a great artist takes to writing down his thoughts and giving us his complete system of art logic, then the world can hail a benefactor. For, be his system right or wrong, it sets all the artists thinking, and out of the practice of thinking comes art.

Such an artist was the late Gottfried Semper, the greatest architect Germany has ever had, and who played an important part in the starting of our English schools and museums of South Kensington. You have, therefore, to some extent, a proprietary right in Semper, and I am well pleased, as Semper's pupil, to have an opportunity of explaining to you this evening the late professor's art logic.

We cannot ask a guide to show us the way before we know where we want to go, and, therefore, for artists, the first question to be answered, before all others, is—What is art? To this question all kinds of answers have been made.

Some say that the more fully an object fulfils its destination the more beautiful it is. Nature will be brought forward as a proof of this, for every detail of a plant or organ of an animal perfectly answers its purpose. Unfortunately, we are still very far from fully understanding the work of God, and I think it will be safer for us to examine this question in the work of man, which we can thoroughly grasp.

Here is a pretty vase. Its surface is delicately modelled and ornamented by paintings. The purpose of this vase is to contain liquid. Now, would it fulfil that purpose less well if it were left absolutely plain? Of course not. Therefore we see there is some other reason for its beauty beside its fitness for containing liquid.

There are a good many people who think that the beauty of a drawing depends on its accuracy and finish. I have seen so-called connoisseurs enthusiastically admiring the portrait of an old man because, armed with a big magnifying lens, they could actually count every hair on his chin, so wonderful was the finish of that picture. If finish and truth are the essence of art, then draughtsmen are nowhere when compared to photographers.

I think you will all agree with me that we do not look at pictures to get information, but pleasure—or, I should rather say, emotion; for the sensations produced by art are not always bright, but often melancholy, and bring as often tears as smiles in our eyes.

The question what is art cannot be answered offhand. Man is born intellectual—that is, with an instinctive wish to comprehend the world in which he lives, with a dissatisfaction at things as they are, and a desire for improvement and perfection. The impossibility of satisfying these—his higher instincts—gives him pain. Still, the satisfaction of these instincts is as necessary to the preservation of his mind as the satisfaction of hunger is to that of his body.

From this aspiration to improvement and perfection three human manifestations have sprung:—Science, by which we endeavour to discover the essence of things—an inquiry which

\* From a lecture delivered at the Chiswick School of Art on Wednesday last.

fills us with hope, and affords thereby temporary relief to our thirsting souls, but which always ends by being baffled; religion, by which we image forth a state of perfection beyond the tomb, and endure the present as of no account; art, by which we create for ourselves a small world, perfect within its limits, in the contemplation of which we forget reality. Art is therefore an abbreviation of nature—it follows the laws which man suspects govern nature's products.

These laws are the Eurythmus or regularity suggested by the regular recurrence of days, seasons, and tides. Then by considering a portion of regularly-formed objects, such as a part of a flower, we get the idea of symmetry. The vegetable world gives us the notion of proportion, the animal world the notion of direction, for most animals have a head and tail. Regularity, symmetry, proportion, and direction, such are the fundamental elements of form both in nature and in art. But they do not in general all reign equally in the same objects. Sometimes it may be regularity which predominates; sometimes it may be direction, and this gives us the notion of bias or character. Regularity is the characteristic of snow crystals, and direction is the characteristic of fishes. Similarly in art, necklaces, dances, and music depend for their beauty on the regular recurrence of objects, motions, or sounds. Symmetry is the special characteristic of frames, windows, doors, and altar-pieces; proportion predominates in towers; and direction in things that have a bias of the will—such as a ship, a cathedral, on the one hand, and the personal ornaments of the hunter and the warrior (the flag, the plumed helmet) on the other.

Ornamentation, dancing, and music are founded entirely on the laws of nature, and therefore we call them natural arts. But painting and sculpture, whose primary object was imitation of nature as a means of recording facts; architecture, whose initial purpose was the construction of man's shelter, as well as language itself, take rank as arts only when they aim at the same results as the natural arts of ornamentation, dancing, and music.

From any of the primitive arts we shall probably be able to deduce principles which may guide you in the comprehension of the beauties of the masterpieces of literature and painting. I propose, therefore, to examine with you some of the most simple of personal ornaments, and illustrate thereby various subjects of art.

The lecturer then examined various natural and artificial objects by the aid of analysis. In conclusion, he said that students should remember that as the sublimest mathematics are dependent on a thorough knowledge of the multiplication table, so in art no high, artistic career can be erected except on the foundation of a thorough knowledge of drawing.

## TESSERÆ.

### Moorish Colouring.

OWEN JONES.

THE colouring of the Casa Real was carried out on so perfect a system that any one who will make this a study can with almost absolute certainty, on being shown for the first time a piece of Moorish ornament in white, define at once the manner in which it was coloured. So completely were all the architectural forms designed with reference to their subsequent colouring, that the surface alone will indicate the colours they were destined to receive. Thus, in using the colours blue, red, and gold, they took care to place them in such positions that they should be best seen in themselves, and add most to the general effect. On moulded surfaces they placed red, the strongest colour of the three, in the depths, where it might be softened by shadow—never on the surface; blue in the shade, and gold on all surfaces exposed to light; for it is evident that by this arrangement alone could their true value be obtained. The several colours are either separated by white bands or by the shadow caused by the relief of the ornament itself, and this appears to be an absolute principle required in colouring. Colours should never be allowed to impinge upon each other. In colouring the grounds of the various diapers the blue always occupies the largest area, and this is in accordance with the theory of optics and the experiments which have been made with the prismatic spectrum. The rays of light are said to neutralise each other in the proportions of three yellow, five red, and eight blue; thus it requires a quantity of blue equal to the red and yellow put together to produce a harmonious effect, and prevent the predominance of any one colour over the others. As in the "Alhambra" yellow is replaced by gold which tends towards a reddish yellow, the blue is still further increased, to counteract the tendency of the red to overpower the other colours. Whether the Moors in their marvellous decorations worked on certain fixed rules, or only in accordance with a highly-organised natural instinct, to which they had arrived by centuries of refinement upon the works of their

predecessors, it would be difficult to say. One person may sing in tune by natural instinct as another may by acquired knowledge. The happier state, however, is when knowledge ministers to instinct; and we are inclined to believe that this must have been the case with the Moors.

### Proportion in Music and Architecture.

F. MILIZIA.

Vitruvius having recommended the architect to acquire some knowledge of music, many have supposed he intended to infer that there was a union between the proportions of that science and architecture; but had they thoroughly studied the passage in question they would have found also his reasons for the recommendation, viz., that the architect should know how to arrange an orchestra or other buildings where sound is important. For want of this attention many, led away by a wild imagination, have endeavoured to erect harmonic structures by the introduction of what they term musical proportions. When the plan, elevation, arrangement, and ornaments of an edifice form one grand whole, then, and then only, can the epithet harmonious be applied. Such a whole is not produced by eighths, fifths, and thirds, but by laborious study matured by observation and reflection.

### Roman Basilicas.

J. H. POLLEN.

The material of these buildings was, in general, brick; and for a kind of masonry, then only valued for its superior cheapness and utility, none ever was more accidentally sublime. That kind of work, of which traces still remain of the age of Honorius in Rome, called "reticulatum," had gone out of use. It consisted in the facing of the mass being laid endways, the bricks being square on the facings and diminishing within so as to set in like teeth. The brick of Justinian's time, and commonly used in the basilicas, is the old dark-red large flat brick, a foot and a half long, with bands of large tile introduced, and arches turned in the same material. The quantity of mortar used, and the proportion of surfaces on which it fastens, form the secret of the extraordinary solidity of this mode of building. The walls and vaults become hills of solid rock. The campaniles, or bell towers, attached to the basilicas, usually distinct from them, are built round at Ravenna, elsewhere square, but without buttresses like our northern towers. The construction, then, of these churches being thus simple and solid, is usually left to speak for itself externally. As architecture, the basilica-builders had no sort of intention of challenging critics in their interiors only. This was by a system of decorative incrustation. Very rarely had they the means, or did interest for the mode of building subsist a sufficient number of ages, to see this incrustation carried out to the exterior surface.

### Artists' Sketches.

GEORGE SCHARF.

The true temperament of the artist is often concealed in the finished picture by the process of completion. Many a bold design has been worn away and lost by elaborate overworking; and sometimes an effect of comparative boldness has been achieved by repeated touchings up. The works of Benjamin West are a strong case in point. His sketches are vigorous in the extreme, but all spirit and clearness of colour have been laboured away in his finished works. Any one who will look at one of the pen-and-ink sketches by Raphael, and bear in mind that it has been done off-hand, at a moment, and without any preparation of pencil outline or other auxiliaries, must be impressed by the wonderful amount of previous labour and perseverance necessary to attain such facility. The materials mostly used, because most readily attainable, were red and black chalk. These, in Italy, are natural productions, sawn from blocks, and used as commonly as blacklead pencils are among us. Such were the materials for impromptu sketching in note-books; but if the artist sat down deliberately to compose or study with reference to a picture, he generally used pen and ink, the latter being a solution of bistre or sepia in water, the former a common reed pen. Another and very refined material was the silver point. Raphael and his master Perugino very frequently used it. A sheet of paper was covered with a flat tint of tempera colour—that is, of distemper paint, such as is used in paper-hanging—which gave not only whatever hue to the paper might be required, but also afforded a sufficiently granulated surface for the silver pencil with a fine point to act upon. At Oxford, in the University Gallery, are some wonderful specimens of Raphael and Perugino's mastery over the silver point. In illustration of the interest belonging to the record of first thoughts, I may mention that certain leaves of a small square sketch-book belonging to Michel Angelo are still preserved at Oxford, on which may be seen the very first thoughts for many of his finest figures connected with the prophets and sibyls on the ceiling of the Sistine Chapel. They are very small and slight, just as he jotted them down on the

spur of the moment; but although in only three or four lines, we see there all the elements of grandeur and dignity which characterise his fresco figures in their most finished condition.

### Marble.

PROFESSOR NEWBERRY.

In common language, any hard, calcareous rock which will take a polish is called marble. But strictly speaking, only those limestones which have been subject to metamorphic action can be properly designated by this term. It must not be inferred, however, from these facts that the marbles are necessarily very ancient rocks, for the causes which have operated to elevate mountain chains and metamorphose the rocks which form them have acted in all geological ages, and some of the most beautiful marbles known are from comparatively recent formations, such as the Carrara statuary marble, which is a metamorphic limestone of Jurassic age. Marbles, in commerce, are divided into two groups—the white and the coloured. In the first category are placed not only the pure white statuary marble, but those which are chiefly white, though specked, clouded or veined with darker colours. The coloured marbles comprise those that are grey, blue, black, green, red, and yellow, or mottled by various mixtures of these colours with each other or with white. Marbles also vary much in their chemical composition, their texture, and their structure, some being nearly pure carbonate of lime, while others—and among these some of the most highly esteemed—contain large quantities of magnesia. In texture they vary from those in which the paste is scarcely granular to such as are very coarsely crystalline. This latter characteristic does not prevent their receiving a high polish, though the finer-grained marbles excel in this particular. In structure they may be homogeneous, though coarse, or veined and brecciated as though composed of a mixture of very different materials; and further, they may be pure or impure—that is, may contain silicious masses, technically known as quartz and flint, or “curdle,” which is generally tremolite; they may be sound or unsound, by which is meant solid and compact, or checked and fissured by cracks or veins; and, finally, they may be strong or weak, durable or perishable. The quality of first importance in a marble is beauty, for it is chiefly a stone of ornament, and their varied and attractive colours and brilliant polish constitute the shining qualities of the most esteemed marbles; but the uses of marble are various, and are often such as to require both strength and durability. The uses to which the “white marbles” are devoted are quite varied, and admit of a diversity of quality. The finest “white stock,” including some statuary, is used for mantels and furniture; the second grade, typified by the “veined Italian” (which is not veined at all, but only slightly mottled or clouded), for the same purposes and for monuments; while “monumental stock,” white mottled with dark blue or grey, generally also banded or clouded, is chiefly employed for sepulchral monuments, while the coarser white, pure or clouded, forms the material of which are composed the most beautiful, if not the grandest, structures raised by the hand of man.

### Contagiousness of Dry Rot.

SIR THOMAS DEANE.

The parish church of the Holy Trinity in Cork having been found to be in a bad state of repair, and quite deformed from bad and unequal foundations, the parishioners resolved on building a new church; but, through want of funds, not being able to carry their design into execution, an extensive repair was decided on. The tower was taken down, and one side wall and the end of the church was rebuilt. Immediately under the floor of the church, and open to the burial-vaults beneath, longitudinal beams of Irish oak, of from 12 to 14 inches square, had been placed, resting on piers, and forming supports for the joists. Though these oak beams were decayed for an inch deep at their surfaces, sufficient of the timber (as it was thought) remained sound, and it was decided that neither they nor the piers upon which they rested should be removed. The vaults were arched over, memel joists, 6 inches by 4 inches, were placed on the vaulting, and connected with the old oak beams which rested on the piers; the floors were removed, the old pews replaced, new columns, coated with scagliola, were erected over the galleries, the old ones in the lower tier retained, and the whole repairs having been thus completed, the church was reopened for divine service, in April 1829. In November 1830 (but eighteen months afterwards), the congregation was annoyed by an unpleasant smell, which, on examination, was found to proceed from dry rot of the most alarming nature. On opening the floors under the pews, a most extraordinary appearance presented itself. There were flat fungi of immense size and thickness, some so large as almost to occupy a space equal to the size of a pew, and from 1 to 3 inches thick. In other places fungi appeared growing with the ordinary dry rot, some of an unusual shape, in form like a convolvulus, with stems of from  $\frac{1}{4}$  to  $\frac{1}{2}$  an inch in diameter.

When first exposed, the whole was of a beautiful buff colour, and emitted the usual smell of the dry rot fungus. Whatever may have been the surprise at the rapid growth of the plant, its action on the best memel timber was a source of greater astonishment. I took up, with nearly as much ease as I would a walking-cane, that which, eighteen months before, was a sound piece of timber (one of the joists), from 12 to 14 feet long, 6 inches by 4 inches scantling; the form of the timber remained as it came from the saw, but its strength and weight were gone. The timber of the joists and floor over the new brick vaulting was completely affected by the dry rot, which was rapidly spreading to the lower part of the columns under the galleries, so that at the rate the infection proceeded, the total destruction of the building would soon have been effected. During a great part of the time occupied in the repairs of the church, the weather was very rainy. The arches of the vaults having been turned before the roof was slated, the rain water saturated the partly decayed oak beams, before described. The flooring and joists, composed of fresh timber, were laid on the vaulting before it was dry, coming in contact at the same time with the old oak timber, which was abundantly supplied with the seeds of decay, stimulated by moisture, the bad atmosphere of an ill-contrived burial-place, and afterwards by heat from the stoves constantly in use. All these circumstances account satisfactorily, to my mind, for the extraordinary and rapid growth of the fungi.

### Numerical Valuation of Pictorial Art.

J. B. PYNE.

The old mode of estimating the general excellence of a work, completed if not invented by Richardson, a most honest and sincere, though somewhat mistaken writer on art, still continues to mislead the equally sincere student; and, though just capable of leading him to estimate a particular quality, is totally inadequate to enable him to determine upon the general or total excellence of any one entire production. Richardson's process was to be pursued somewhat in this manner. A certain number, say ten, was given as a representative of the maximum value of every pictorial constituent. Thus, a work in which composition, chiaro-oscuro, colour, drawing, invention, expression, character, harmony, ideality, and grace may each be rated at their highest state of perfection, and numbered ten, would necessarily stand as A. No. 1 in art, as, added together, the full sum would reach 100, being the highest possible amount to be reached by this process. A work in which each constituent should be valued at 5, and amount in the gross to 50, would rate as exactly mediocre, and, at any rating under this sum, would have to be pronounced as more or less bad in its descent through the lower numbers. Nothing can be more apparently straightforward than this mode, its only and great disadvantage being that it does not lead directly to the object desired, but unfortunately so much across it that the further it be pursued the more the judgment will be led astray. For instance, there are many constituents of very high value in themselves that are but sparingly admissible in certain works, and others of equal respectability that are totally inadmissible, the first requiring strict subordination and the last requiring expulsion altogether. It follows, then, that to introduce them at their highest excellence would be to damage a work to the full amount of 10 each; or, at any rate, 5 each for the first and 10 each for the second class. It is indeed notoriously the impression of first-rate and classical critics that high works depend upon few constituents, if it may not be added that the highest maintain their pre-eminence on the fewest.

### French and English Timber Flooring.

PROFESSOR HOSKING.

We can and do frame floors most effectively by carpentry alone, whereas the French do the work in framing their floors so badly that no important bearing is, or indeed may be, trusted by them to the framed joint, dog-nailed stirrup straps of iron being always brought in aid. But the common practice with us, who can and do frame floors well, is to use single or unframed floors, which carry the weight and the vibration to which floors are exposed into the walls over voids as well as over solids; whilst, on the other hand, the French almost invariably frame their floors to or upon girders, by means of which the floors are brought to bear upon the solids of the walls. The walls are thus not only less exposed to vibratory action, but are both tied together and strutted apart with better effect by the stout girders stiffened by joists than by joists which themselves require some foreign aid to stiffen them. Moreover, single floors of joists, unless trimmed at frequent intervals—when, indeed, they may be termed half-framed—require, or are thought to require, plates of timber laid along the inside faces of outer walls and upon internal walls, and thus tend to the injury of the walls by introducing timber, that bane of brick and stone walls, into their structure, so as to render the timber a part of the structure. This defect is avoided by our neighbours, who exclude all timber, except the bearing ends of girders, from their walls, and who use framed floors.

## NOTES AND COMMENTS.

MR. ANDREW MACCALLUM, who is a native of Nottingham, has presented his large picture of *The Mayor Oak, Sherwood Forest*, to the Midland Counties Art Museum, to which Nottingham Castle is appropriated. In addition to Mr. JAY's picture, *At the Fall of the Leaf*, the Corporation have purchased for the gallery Mr. JOHN CHARLTON's battle-piece, *The Royal Artillery at Tel-el-Kebir*, which was exhibited at the Royal Academy in 1883.

WE wrote strongly against the proposal to erect a replica in the Gardens on the Thames Embankment of the BURNS statue in Dundee, on the ground that the original was unfitted for a public place, or for a memorial of the poet. A second replica is in New York. It is now proposed to erect a statue of BURNS in Montrose. Mr. CARNEGIE, in sending a subscription to the fund, expresses an opinion of the New York figure, which will show that we have not been alone in condemning the work. "In the interest of art, and from a due regard for my favourite poet," he writes, "permit me to express the hope that you will not think of taking a replica of the statue with which we are afflicted in New York. To see BURNS in the form of a hump-backed simpleton is distressing; and I assure you that more money could be raised to take the statue from New York Central Park than was raised to put it there."

THE French artists have organised a copyright bureau for the protection of their interests, and it has been opened in the Faubourg Montmartre, under the direction of M. FOUSSAT. The position is convenient for the artists in the newer quarters of the city. It is characteristic to find co-operation applied to law in this way, but French artists appear to be less cognisant of their individual rights than their English brethren, and unless there is somebody on whom the trouble of litigation can be thrust, with a number of people to share the expenses, the pirates can copy and photograph without limitation.

THE exhibition which is to be opened next month at Buda-Pesth will give painters an excellent opportunity of seeing the most picturesque costumes in Europe. As the exhibition is to contain examples of agriculture, industry, and art in all forms, it has to be on an extensive scale, and about one hundred buildings, large and small, are now being constructed. There will be an eastern section in which the products of Bosnia, Roumania, Bulgaria, and Turkey will be seen. In some departments it will be international, but the Municipality and the Government have resolved that the exhibition shall be essentially Hungarian.

THE largest block of white marble seen in Antwerp has been lately delivered at the studio of M. ROUSSEAU. It was drawn from the dock by nine horses. The weight is 23,000 kilogrammes, or about 22 tons. The marble is to be used for a public statue of JORDAENS, the painter, who was born in Antwerp in 1594.

THE report of the great gas company which has the concession for the lighting of Paris is an interesting document for people who take pleasure in comparing statistics. The consumption of gas during last year has been more than two hundred and eighty-seven cubic metres, being an increase of about three and a half millions over the year 1883. The receipts for gas alone, exclusive of coke, tar, and ammoniacal liquor amounted to 73,369,545 frs., or about three millions sterling. The cost of production, including administration and taxes, was about sixty millions of francs. In Paris there are 51,823 public lamps, and outside the fortifications 8,694. The pipes laid under the streets are 2,075,782 metres in length. It is found that people are becoming more desirous to have gas on all the floors of the houses.

THE Berlin Law Courts are engaged in trying a curious case. One of the journals lately stated that a picture of a nude figure, called a *Baigneuse*, which appeared in the Fine Arts Exhibition of Berlin, was a portrait, and that it had been painted by a Bavarian artist out of revenge against the

subject. The figure was recognisable by a mark like that which IACHIMO saw on the breast of IMOGEN. The paragraph went the round of the German papers, and one of them supplemented the information by giving the name of the artist, who accordingly took an action against the journal in which the statement first appeared. The painter declared that the whole story was an invention, as he had never exhibited a picture of the kind. The publisher stated that he was ready to produce the evidence of the writer of the paragraph who had seen the picture, and a statement from the committee of the exhibition by whom it had been received and shown. It was also proposed to bring forward the *Baigneuse* herself. The judges opposed the last offer, but they have admitted the rest of the evidence, and therefore the case is to be continued. There seems to be no power to compel the production of the offending picture.

THE British Association will meet this year in Aberdeen, and, as the exhibitions of the local artists' society have been held during May, June, and July, it was feared that visitors who might visit the northern city to attend the scientific meetings would lose the advantage of seeing the pictures. At the request of the Council of the British Association the opening of the exhibition has been postponed until July, and it will not close until September. The Council have entered into an agreement with the Art Gallery Committee of the Corporation to guarantee a sum equal to one-half of the proceeds of the exhibition.

MR. LIONEL HAWKES has delivered a lecture before the Bolton Art Club on "Unadulterated Nature," in which dissatisfaction was expressed with the "grooming" which is now adopted by landscape painters in order to make their pictures superior to Nature. Painting the lily is simple if compared with the process. The superior worth of unadulterated Nature over the whole resources of studio skill and orthodoxy in art was maintained, and the lecturer advised artists to study Nature in its truth, and stand by it.

THE Central Committee of the Mansion House Council on the Dwellings of the People, in appealing for funds, announce, for the information of the public, that, while they are favourable to all schemes for reconstructing the dwellings of the working-classes on improved principles, yet this is a work demanding vast funds and a considerable period of time, and does not deal with the immediate and pressing evils. The work of the Council consists in taking advantage of the large amount of sanitary legislation now on the statute books, and remedying present evils so far as the *vis inertiae* and obstructiveness of the vestries will permit. At comparatively trifling expense, and by means of local committees (now thirty-six in number, spread all over London), local knowledge and local energy are brought to co-operate in this most important work. The whole work of the Council is carried out at an expenditure of about 600*l.* a year.

So many hard things have been said against the surveyors under the Ecclesiastical Dilapidations Act, there is some satisfaction in finding that one clergyman has had the courage to speak a word in their defence. The Rev. H. L. WATSON says that, in the archdeaconry of Leicester, the fees have produced an average income of only 75*l.* per annum. As to the exorbitant assessment, he finds, on dividing the period since the passing of the Act into two equal divisions and omitting one very exceptional case in each, that the average assessment in Leicester in the former period was 175*l.* and in the latter 95*l.*, indicating the better care taken by incumbents to provide against the charge. As to appeals, the Act has been worked so fairly that there has been only one in the archdeaconry (which is not exceptional in its extent or the character of its glebe buildings and parsonages), and in that one case the surveyor was unable from severe illness to complete the survey himself, and the appeal was on the ground not of an exorbitant but of an insufficient assessment, to which a slight addition was then made. Mr. WATSON believes that as it would be difficult to frame better provisions than those of the Act, the wisest course now is to adopt the principle of *quiesce non movere*.

## ILLUSTRATIONS.

DESIGN FOR ADMIRALTY AND WAR OFFICE.

WE publish this week two illustrations showing the design of Messrs. LEEMING & LEEMING in its perfected form. The design will be subjected to severe criticism in and out of Parliament—that is, if the House can, at the present juncture, find time to consider a subject such as art. We would point out to critics that when the design first appeared many people who were adverse to it became its supporters, and in a little time the amended design may also be able to convert opponents into friends.

## EDINBURGH ARCHITECTURAL ASSOCIATION.

ON Saturday last, about seventy members of the Association left Edinburgh by train for Roslin. The scene of the excursion was Roslin Chapel and Castle, and the party were under the leadership of Mr. Andrew Kerr, who read a paper. The lower chapel, which might be regarded as a separate building, with a priest's chamber on the south side, was, he remarked, said to have been erected by Lady Elizabeth Douglas, and dedicated to the Virgin Mary. The upper chapel, or collegiate church, was founded by Sir William St. Clair, third Earl of Orkney, on St. Matthew's Day (September 21, 1450), and dedicated to St. Matthew. The present chapel was intended for the choir of the complete building, which had been founded to its full extent. The foundations had been traced a considerable length, but those of the cross west wall were removed about the end of last century. The western part or nave appeared to have been intended to embrace a central, with a double aisle on each side, after the manner of the nave of Toledo Cathedral. The choir was confined to a single aisle on each side of the central one, and a double aisle at the east end, more properly a retro-choir, embracing four chapels. The entire arrangement of the choir was almost a repetition of that of Glasgow Cathedral, only Roslin Chapel had been more carefully studied in the elaboration of the ornaments. The plan of thirteen of the pillars was the same as that of those in the nave of Següenza in Spain. One special peculiarity of Roslin Chapel was the "horizontal arches" over the side aisles. In these, however, safety arches were concealed by a face ornament on each side. In some parts of the chapel there appeared indications of representations of religious or other allegories, and in the western compartments of the roof Scriptural teachings were plainly represented in the sculptures. Dr. Daniel Wilson, in his "Prehistoric Annals of Scotland," said that the Scottish Decorated period, to which Roslin Chapel belonged, prevailed between 1306 and 1500. Mr. Billing, the English architect, stated that Roslin Chapel combined the solidity of the Norman with the minute decorations of the latest species of the Tudor age; and in the "Baronial and Ecclesiastical Antiquities of Scotland" it was remarked that the chapel drew on the riches of almost every phase of Gothic architecture, except that which was contemporaneously present in England. Mr. Fergusson stated that there could be no doubt that the architects came from the north of Spain, and that the design of the tunnel vault of the roof was to be traced to the old churches in the south of France. The plan and section of the chapel were found to be designed upon and defined by certain principles of geometric proportion, in accordance with what was believed to have been the general practice of the period. The founder of the chapel was evidently a religious man, of high culture and extensive experience and observation in architecture, and that, keeping his purpose steadily in view of "erecting a most curious work of great glory and splendour," he gave effect to his observations by introducing them into his designs as opportunities occurred. The entrance to Roslin Castle had originally been protected by a trench and drawbridge, which were replaced by a stone arch about the end of the sixteenth century. The castle formed an irregular oblong square, with gardens at the south and east sides. On the left of the court was the "Lamp" tower, known by that name on account of signal-lights having been displayed from it. The keep or donjon tower at the south-west corner was erected towards the end of the fourteenth century, and the buildings on the west side connecting the towers were built about the middle of the fifteenth century. These contain domestic departments and a chapel. The buildings existing upon the north-east side were erected between 1597 and 1622, and were arranged for additional servants' accommodation, including a great hall with a fireplace of characteristic design. On November 11, 1688, a mob attacked and plundered the castle, and on the same night some portions of the chapel were defaced, the object being to burn the images and popish books.

The castle remains now much in the same condition as it was left by the mob in 1688.

At the conclusion of the meeting votes of thanks were given to the Earl of Rosslyn for his lordship's kind permission to visit the chapel and castle, the Rev. A. T. Grant for his attendance, and Mr. Kerr for the description of the buildings.

## ST. BARTHOLOMEW-THE-GREAT, WEST SMITHFIELD.

THE following letter on the subject of the restoration of St. Bartholomew's has been sent to the *Times* by the Rev. Precentor Venables:—

As one who for more than half a century has known and loved the grand old Church of St. Bartholomew, West Smithfield, I should be glad to be allowed to express the satisfaction I feel at the energetic action taken by the newly-appointed rector and his churchwardens, and other leading residents in the parish, for ridding the sacred building of the mean intrusions which have been too long permitted to mar its architectural effect and to degrade its religious character, and to offer my hearty wishes for the success of the work they have taken in hand.

As an historical and architectural monument this church has scarcely an equal in the City of London. As the church of a Priory of Austin Canons founded in the latter part of the reign of Henry I. (1123) by a brilliant young inmate of the king's court, named Rahere, on his conversion to a life of religion, it presents, in the words of the late Sir Gilbert Scott, "a beautiful specimen of the later Norman," of which style it is the only example still existing in London. The present church, it is hardly needful to say, is no more than a mutilated fragment of the once noble cruciform edifice. Of the nave only one bay stands. Both transepts are gone. A blacksmith's shop occupies the site of the north transept, and the din of his anvil resounds through the conventual aisles. The central tower has perished, but the stately arches which upreared it, two semicircular and two pointed, the latter accommodated to the two narrower sides of the lantern, still form the most striking feature of the interior. The apsidal aisle at the east end, long cut off from the church by a transverse wall, enclosing a dark lone house called "Purgatory," was thrown into the church some twenty years back. The upper part of the apse—or rather the space it once occupied—has been stolen by a fringe factory, which has been constructed within and upon the walls of the former Lady Chapel and now protrudes its shapeless mass into the church and actually hangs over the altar. The north triforium accommodates the parish school, and the whole edifice is encumbered on all sides by rickety old houses of the meanest sort, threatening a repetition of the conflagration of 1830, when several of the then existing conventual buildings perished, and the church itself was much injured and narrowly escaped destruction.

It will be remembered that this church witnessed the strange affray in 1249 between the young Savoyard, Archbishop Boniface, and his mercenary bands, and the sub-prior and canons, who were respectfully but firmly resisting the Primate's claim to visit their monastery officially, when the sub-prior barely escaped with his life from the blows of the Archbishop's fists; and a general conflict ensuing, the whole City was kindled by the uproar. The churchyard was in former days the scene of disputations of a more seemly kind between the scholars of the various schools of the City, of which old Stow speaks as an eye-witness.

Dissolved by Henry VIII., the existing church being preserved for the use of the parishioners, the religious foundation was revived for a brief space under Queen Mary, as a house of Black Friars or Dominicans, who began to rebuild the nave, their work being speedily cut short by the death of their royal patroness. Machyn's diary contains curious references to this period of its history. The church contains the monuments of Rahere, the founder of the priory, and of Sir Walter Mildmay, the founder of the "House of Pure Emmanuel," at Cambridge.

As has been already stated in the *Times*, an opportunity is now presented of restoring this historic building to some measure of its former dignity, and of freeing it from the mean secular interlopers which have been allowed to hem it in and actually to occupy what were once parts of the church itself, by the purchase of the fringe factory, which has been offered to the parochial authorities for sale at considerably below its market value. As the rector has stated, the days of grace, which had nearly run out, have been extended to May 15. Is it too much to hope that before that date arrives the whole sum required for the purchase, and for the complete restoration of this grand relic of old London, will have been raised? I am no lover of restoration (so-called) generally. This, however, is one which is absolutely needed if the church is to be rescued from secularisation and decay.

## WESTMINSTER HALL.

A PAMPHLET has been issued by the Society for the Protection of Ancient Buildings on the proposed restoration of Westminster Hall. The following extract will suggest its spirit:—

The group of buildings now forming Westminster Hall is, as described by the late Chief Commissioner in his speech before Parliament, in its present state a noble one, and, in the opinion of this Society, an immense improvement to the whole aspect of that part of Westminster; but the Society most earnestly feels it to be of the utmost importance that the case for the preservation of the ancient Hall be not made to rest only on the appearance which it presents, noble as it undoubtedly is. The Society maintains that original work of Rufus and of Richard II. having come into the possession of the nation, it is the duty of the nation to preserve that work in its integrity, whatever the appearance of it may be in the eyes of the present generation. The discovery of this original work of Rufus and of Richard II. is almost unique in the history of England. This Society cannot instantly remember another case in which a building for so many centuries so completely hidden has been brought to light in so admirable a state of preservation. Its contemporaries of the Middle Ages, and even the later work of Henry VII.'s Chapel, have been variously recased and restored; this fragment of the ancient palace of Richard II. comes to us, in parts of it, fresh from the hand of the mason. In parts of it, indeed, it has suffered severely from injudicious alterations and rough treatment, but that which has been spared is the genuine work of Richard and of Rufus, and still bears upon its surface the marks of the hammer which struck its stones into shape. A veritable relic of the ancient Palace of Westminster, it is as startling a revelation to modern London as would be to Rome the sudden reappearance of the ancient buildings of the Capitol, and it should be as venerable and as deserving of our utmost care and protection. The duty of the Office of Works, then, the Society for the Protection of Ancient Buildings respectfully submits, is the preservation of the ancient work absolutely as it is, without alteration or addition; or if, on examination, that be found to be impossible, or too dangerous, then with such alteration, addition, or repair only as may be necessary to the accomplishment of that end.

## TECHNICAL EDUCATION IN RUSSIA.

THE report which has been prepared by Mr. William Mather for the Commission on Technical Education gains additional interest at the present time, for it may be said to raise the questions of to what extent the interest of the empire is connected with industry, and whether the difference between factitious and genuine prosperity can be realised by the Russian people. Mr. Mather has been travelling in Russia for a period of twenty years, and he is therefore in a position to speak with authority.

Russia, he says, differs from all other European countries in not possessing some national system of elementary education. This may be accounted for by the institution of serfdom, which up to 1860 excluded what we should call the "working classes" from all rights beyond those accorded to them at the pleasure of their owners. Education in the most elementary form may, here and there, have been given in the villages by the priests if the proprietors permitted or encouraged it. In the towns no provision whatever was made by the authorities for the education of the labouring classes previous to the emancipation.

On the other hand, the Government has for many years paid considerable attention to the formation of educational institutions for the families of military and civil officials, the professional classes, and all grades of the nobility. To such institutions the sons of merchants have also been admitted, but the latter have had to depend chiefly on private tutors, and largely upon the advantages offered in other countries, or in Finland, the Baltic provinces, and Poland, which are politically parts of Russia, but retain to some extent their own social institutions, and have long possessed greater facilities for general education, in proportion to the population, than those existing in Russia proper.

In such towns as St. Petersburg, Moscow, Tver, Tula, Kharkof, Kief, Kazan, Saratof, and Odessa, colleges (Realschulen) and gymnasia have long existed, and in some of them also universities. There are not more than twenty towns in Russia proper having over 50,000 inhabitants, and not more than 150 having over 10,000. The urban population is extremely small compared with the whole number of inhabitants. Exact statistics are not easily obtained, but it is within the mark to state that not more than 10,000,000 out of a total population of about 80,000,000 dwell in what we should designate "towns," using this term in its narrowest sense.

The rest of the population is spread over a vast territory, in

small communities, pursuing rural occupations under conditions of agriculture and the holding of land, since the emancipation, which will yield enough, with something to spare in the most fertile districts, to those peasants who are frugal and thrifty. Notwithstanding that all the serfs received a grant of land with their freedom about twenty-two years ago, the inferior quality, or the want of means to improve it, has made it impossible, in a great number of cases, for the peasants to wholly maintain their families in their own communes or villages. Hence there is a great deal of migration, the heads of families move in search of employment to long distances, leaving children to the care or neglect of their relations. The parents will even separate one from the other, and live hundreds of miles apart from Easter to Easter, when all work ceases for one week to a month among handicraftsmen and in all kinds of manufacturing, and family reunions take place amid the religious festivals of the Russian Church. These migratory habits are on the increase since the extension of the railway system.

The only education at present available in the villages is a certain amount of instruction which it is the duty of the village priest to impart, but over which there is no control. There is no village where a priest is not stationed or a church does not exist. Sometimes a group of little hamlets a mile or two apart will have a church and one school in common. The priests are generally men of very meagre education, with large families, and a small quantity of land which they have to till, often with their own hands, to secure a livelihood.

It will readily be seen that such conditions are not favourable to education, even in the narrowest sense of the word. Some children acquire reading and writing imperfectly if they are naturally bright, but as there is no systematic superintendence of public instruction on the part of any authorities, the masses of the people are still growing up in ignorance, and the vice of intemperance is one of the most painful results of it. There are, however, some indications of improvement.

Taking the country as a whole, the mechanical arts and industrial pursuits, as distinct from agricultural occupations, are comparatively insignificant, and the resources of the country hitherto developed do not offer great facilities for such occupations. There has, however, been a good deal of ambition shown on the part of the Government to encourage by artificial means mechanical and manufacturing skill. The two great Imperial Technical Schools of Moscow and St. Petersburg have long been classed among the finest in Europe in point of equipment, and in possessing ample means. The museums and mining school of St. Petersburg have for many years afforded the opportunity for a high-class theoretical training in mining engineering, and contain a rich record of the mineral resources of the empire. A large civil engineering school has existed for many years at St. Petersburg; also a school for surveyors and hydraulic engineering. These schools were originally managed by foreigners—German or French—but for many years past the staff of teachers has been entirely composed of highly-trained Russians. The preparation necessary for students entering these institutions has been in the real-schools, progymnasia, and gymnasia, also established by the Government. In recent years some efforts have been put forth by private individuals to establish handicraft schools and manual training schools. Several of the large railway companies have also established small technical schools for the sons of their employes.

The Imperial Technical School of Moscow trains civil engineers, mechanical engineers, draughtsmen and foremen, and chemists. The complete course of studies is a combination of theory and practice. The theoretical studies are carried on in large class-rooms, amply supplied with all necessary apparatus for illustration. The practical lessons are given by means of manual work in workshop classes, specially arranged for exercise in the use of hand-tools, followed by the construction of simple machines, or parts of machines, in the workshop proper, comprising foundry, smithy, machine-tool and fitting department, and joiners' shop. The products of the workshop are sold or put into the museum. There is a loss of some hundreds of pounds a year on the sales. The foundry is probably the only department which pays its expenses, and here twenty-five regular workmen are employed to instruct students and make castings. About eight tons of metal a week can be turned out in castings. In all departments a few regular workmen are constantly employed.

The students work in the shops and laboratories not less than 12 hours a week. The smithy and foundry are not entered by students until the last year of the course, during which 100 hours are devoted to these departments. There is a special course for students who, for want of the natural ability to pursue theoretical studies, cannot get beyond the examinations of the third or fourth year, but who may nevertheless possess the practical and constructive faculty. The work given to the special class is all of the most practical character, such as the making of working drawings and full-sized drawings of parts of machines, making experiments on materials, working longer hours in the shops, and generally devoting their time to the

application of the knowledge they have gained in the more elementary branches of science.

The civil engineering students are much occupied in making what they term "graphic mathematical calculations"—a written description of some engineering work is given to the student of which he must first make a freehand general design, and then freehand sketches of each detail, with full dimensions, and with the necessary calculations worked out on each sheet for the correct construction of the whole work.

There is also an institute for the education of land surveyors, which is free. About 260 students attend, many of them being sons of poor Government officials. The staff consists of one director, one inspector, and thirty professors and teachers. The general education is good, followed by special instruction in land surveying, forestry, &c.

One of the most important institution in Moscow is the Stroganoff Central School of Technical Design and Museum of Art and Industry. This school was established by Count Stroganoff, with the assistance of the late emperor, who gave a property in Moscow of the value of 40,000*l.* as an endowment. It occupies a large and handsome house of Count Stroganoff's, and affords accommodation for about 400 art students of both sexes. The teaching staff consists of a president, M. Alexis d'Illine, ten professors, and three instructors. The fees are merely nominal. The institution is open to all classes from the peasant to the noble, the materials being found for the poorest students. The instruction is confined almost exclusively to drawing, from the earliest stages to its highest branches—geometrical, freehand, mechanical; drawing from objects, projection, perspective, Russian ornamentation, drawing from flowers and plants, the study of design as applied to the industrial arts, figure subjects, modelling the human figure, painting on china, water-colour and oil painting. There is a large collection of models and casts. A considerable number of the scholars are engaged in designs, chiefly for woven fabrics, and several Jacquard looms are employed for experimental effects. Modelling in clay is also taught, with all the necessary appliances. The chief result of the drawing school has been the training of teachers for schools, but many of the students have found employment in church decoration and the painting of icons, used so largely in the churches and in every household in Russia. Art exhibitions are promoted by this institution from time to time. It is capable of greater usefulness than it appears to accomplish at present. It lacks the interest of the wealthier portion of the public, necessary to make it all that its name implies. The school of design might afford an excellent training for designers in connection with the textile industries in and around the city, but hitherto little interest has been taken in it by the manufacturers to develop native talent in this direction for their own industries.

Probably the most important work performed by this institution since its foundation in 1860 is the commencement of a museum of art and industry, a sort of South Kensington in embryo. The most interesting and useful feature is the section devoted to the historical collection of Slavo-Russ art and Byzantine art. The specimens largely consist of facsimile copies of old manuscripts, the fruits of painstaking investigations by the Stroganoff school; also reproductions in plaster, and by oil paintings of ancient works of art, executed in metal, wood, stone, ivory, and woven fabrics, found in public and private collections, and in the churches throughout the empire.

In connection with this museum a remarkable work has been published, entitled "History of Russian Ornamental Art." It is illustrated with one hundred large plates, exquisitely coloured, representing many hundreds of the finest examples. "Russian ornamentation" is a branch of art peculiar to the country. It is a blending of the Byzantine, Slavonic, and Asiatic elements, forming a distinct style, and admitting of an infinite variety of designs of quaint beauty, which the gorgeous yet harmonious colouring renders extremely effective. The style dates from the tenth century, and its development follows the growth of the Russian Church. This truly national art of decoration has touched the whole people. It may be traced in the carvings and adornments of the peasants' huts, on articles of rudest furniture, in the embroidery of linen, silk, &c., and in the ornate national costumes of both sexes. It has produced a taste for rich colours in public buildings, dwelling-houses, upholstery, and wearing apparel, which is peculiar to the Russians to this day. In fact, in recent years a powerful revival has taken place in the study and application of the national art, which makes itself apparent in the newest productions of all manufactured articles and fabrics. The tendency of this movement is undoubtedly elevating and refining. It is evidently the ambition of the Stroganoff school to promote the study and practice of the art in connection with the industries of the country.

St. Petersburg is better provided with means of education than Moscow. There are, for instance, 156 elementary schools supported by the town authorities, and 25 high schools. The Technological Institute, which covers an area of 10,000 square yards, has 700 students in daily attendance. It is presided over

by Professor d'Illine, and enjoys a high reputation in Russia. There are sixteen professors and thirty-two teachers, besides instructors in workshops. About 150 students are free, and one-half pay only 5*l.* a year. The fees amount to 2,500*l.*, while the expenditure is ten times that sum. The students are admitted without regard to nationality or religion.

The Civil Engineers' Institute was established in the reign of Alexander I. It has accommodation for over 400 students. There are at present 250 students in attendance, of whom 190 pay 5*l.* a year. It occupies very extensive and handsome premises, which cost about 100,000*l.* It possesses an excellent library, a very fine collection of instruments and apparatus for physical science, a well-equipped chemical laboratory, a very fine museum and model-room, in which are models of the most important engineering works carried out in the empire, including canals, waterworks, buildings, railway bridges, docks, light-houses, &c. One important feature in the institution is a very fine experimenting room, to illustrate constructive engineering, the testing of beams, girders, columns, the strength of materials in torsion, tension, and shearing strains; the qualities of stone, bricks, and cement; the strength of timber and of appliances used in railway construction, hydraulic apparatus, and specimens of rails used in the construction of the Russian railways. The institution is under the control of a director, Professor Ghersevonof, an inspector, his assistant, twelve professors, eight demonstrators, and ten masters. The expenditure of the school is about 11,000*l.* a year, supplied by the Government.

This establishment gives a highly theoretical training in civil engineering by means of a course extending over six years. The students generally enter at nineteen or twenty years of age. The instruction is confined entirely to lectures and demonstrations in the lecture-rooms. Freehand, architectural and mechanical drawing are taught with great thoroughness, also higher mathematics, land-surveying, chemistry, and the principles of engineering science as applied to railways, roads, canals, docks, waterworks, and public buildings. The only practical work undertaken in the school is in connection with the mechanical laboratory, in experimenting upon materials used in engineering construction, and in the experimental construction of bridges by the use of models. In the summer months the students go out for surveying purposes along the canals and rivers, and in the country around the city. The works of railway companies are also visited, and the laying of the permanent way, and railway appliances generally, are inspected and reported upon. Nearly all the graduates of this institution pass into the Government service, and some are sent to remote distances in the empire to superintend the making of roads, bridges, &c. About two thousand young men have been passed through the full course during the last twenty years of its existence.

The Imperial Academy of Fine Arts offers great facilities, to all classes equally, for the study of drawing, painting, and sculpture in connection with the National Picture Gallery and Museum. A considerable field for the employment of artists and art students exists in Russia, owing to the decoration of churches with paintings of sacred subjects, and the demand for sacred pictures among all classes of the population. These are regarded as indispensable objects in every room, both of cottage and of mansion, and consist largely of paintings in oil. There is no doubt that the splendid galleries and rich collection of works of art at St. Petersburg have a great influence, though limited at present to the higher classes.

The educational institutions of Russia, even including those of Poland, Finland, and the Baltic provinces, are not sufficient to account for the intelligence and enterprise displayed by a large number of merchants and manufacturers and professional men. The facilities for education offered in Germany have for many years been appreciated and utilised by the middle classes of Russia, also the aptitude to acquire languages natural to the Russians has enabled those who had means to travel over Europe to collect information readily. The presence of a large number of foreigners of exceptional ability—German, English, and French—has promoted the rapid growth of manufacturing industries (within the limited field which the natural conditions of the country offer), and much is due to the spread of western ideas on all subjects.

It must, however, be admitted that Russia has produced some distinguished men in science, art, and literature. In the science of engineering the most eminent have been connected with the military and naval services, or some other branch of Government employment. Originality and boldness of conception have not been wanting in the public works executed during the last half century, though it is difficult to draw the distinction between foreign and native talent. Probably very few eminent men have been educated exclusively in Russia. It is almost essential for an educated Russian to live some time abroad to acquire several European languages. The scientific man, especially until recently, must have depended largely upon foreign books for his information, and, doubtless, with few exceptions, the most distinguished men outside the Govern-

ment service have received part of their education or experience out of their own country.

The principal of the Civil Engineering School at St. Petersburg has built some of the important bridges in the country. He derived his education from Russian sources. Naval construction has been the object of bold experiment by Russian engineers, adding to knowledge though not resulting in practical success.

Electricity has long been a favourite branch of science with Russian physicists, some of whom have experimented usefully in the direction more particularly of the application of electricity as a motive power. In quite recent times the name of Jabloschkoff entitles Russia to a very honourable position in the development of electrical science. The work of Jabloschkoff will always be recognised as having contributed to the rapid growth of electric lighting throughout the world.

In travellers, explorers, and geographers, Russia has furnished daring and cultured men, whose labours have brought under notice vast regions on her borders ready for the spread of commerce and civilisation. In the fine arts Russia has commenced a school which is already recognised as possessing distinct qualities of imagination as well as high technical skill. In the field of general literature the names of Russian authors are becoming widely known and deservedly honoured.

The masses of the people show the aptitude to learn quickly when well directed. They possess some excellent natural qualities—docility, endurance, obedience, veneration, and the faculty of imitation. They are rising in self-respect, and the spirit of emulation is growing fast. All these qualities only require quickening by systematic elementary instruction to create a new life in the people, leading to greater prosperity and morality. There is a strong desire apparent to be less dependent on foreigners, and if this could only be accompanied by a determination on the part of the authorities and the higher classes to extend educational and other institutions, on the principles upon which other great European nations have been built up, there is reason to believe that the great resources of this vast empire will be rapidly developed by an intelligent people for their own advantage and the welfare of mankind.

## Bygones.

*"Antiquity after a time has the grace of novelty."*—HAZLITT.

### BUILDING IN THE LAST CENTURY.

IT would appear from the following essay by the Rev. Henry Kett, which was written in 1787, that there was about that time a remarkable eagerness in England to erect new houses. Since all events are supposed to be repeated with regularity, it is to be hoped that opportunity may soon be given to university dons to indite similar lamentations to Mr. Kett's.

When Greece and Rome had emerged from barbarism to an exalted state of civilisation, a distinguished place among the arts was given to architecture. The accomplished Pericles, assisted by the refined genius of Phidias, adorned Athens with those temples, theatres, and porticoes which even in ruins have excited the admiration of posterity. After Augustus had established the peace of the Roman world, a similar display of magnificence was exhibited, and equalled, or rather surpassed, the glory of Athens. This memorable era of architecture is eminently distinguished by the elegance of the Palatine Temple of Apollo, and the sublimity of the Pantheon.

The progress of refinement from public to private works must necessarily be private houses, because nothing is more natural to man than imitation, particularly of that which is the object of his wonder and applause. They who daily surveyed such edifices as were remarkable for capriciousness and grandeur, projected the erection of similar structures upon a more confined plan. Their designs were frequently carried to such an excess in the execution as to pass the limits of convenience and economy, and give a loose to the sallies of ostentation and extravagance. From this source was derived the just indignation with which Demosthenes inveighed against the degenerate Athenians, whose houses eclipsed the public buildings, and were lasting monuments of vanity triumphant over patriotism. The strictures of Horace flow in a similar channel, and plainly indicate that the same preposterous rage for building prevailed among the Romans. Even if we make allowance for the hyperbolic flights of the lyric muse, we must still suppose that vast and continued operations of architects were carried on by land and water, "since a few acres only were left for the exercise of the plough, and the fish were sensible of the contraction of their element."

The transition from the ancients to the moderns is easy and

obvious. It must be confessed, that, like servile copyists, we have too closely followed the originals of our great masters, and have delineated their faults as well as their beauties. The contagion of the building influenza was not peculiar to the Greeks and Romans, but has extended its virulence to this country, where it rages with unabating violence. Neither the acuteness of Pott, nor the erudition of Jebb, are necessary to ascertain its symptoms in various parts of England. Bath, Bristol, Cheltenham, Brighton, and Margate bear evident marks of its wide diffusion. The metropolis is manifestly the centre of the disease. In other places the accumulation is made by occasionally adding house to house, but in London street is suddenly added to street, and square to square. The adjacent villages in a short time undergo a complete transformation, and bear no more resemblance to their original state than Phyllis the milk-maid does to a lady mayoress. The citizen who twenty years ago enjoyed at his country seat pure air, undisturbed retirement, and an extensive prospect, is now surrounded by a populous neighbourhood. The purity of the air is sullied with smoke, and the prospect is cut off by the opposite houses. The retirement is interrupted by the London cries and the vociferations of the watchmen. In the vicinity of the capital every situation is propitious to the mason and the carpenter. Mansions daily arise upon the marshes of Lambeth, the roads of Kensington, and the hills of Hampstead. The chain of buildings so closely unites the country with the town, that the distinction is lost between Cheapside and St. George's Fields. This idea struck the mind of a child who lives at Clapham with so much force, that he observed, "If they go on building at such a rate, London will soon be next door to us."

A strong light is often thrown upon the manners of a people by their proverbial sayings. When the Irish are highly enraged, they express a wish which is not tempered with much of the milk of kindness, by saying, "May the spirit of building come upon you." If an Irishman be once possessed by this demon, it is difficult to stop his progress through brick and mortar, till he exchanges the superintendence of his workmen for the confinement of a prison. But this propensity is not merely visible in the environs of Dublin, or upon the shores of Cork; it is equally a characteristic of the *sister kingdom*.

England can furnish not a few instances of men of taste who have sold the best oaks of their estates for gilding and girandoles—of fathers who have beggared their families to enjoy the pleasure of seeing greenhouses and pineries arise under their inspection—and of fox-hunters who have begun with a dog-kennel, and ended with a dwelling-house. Enough is every day done by the amateurs of Wyatt and Chambers, to palliate the censure of ostentation and uselessness that is lavishly thrown upon the king's house at Winchester, and the Radcliffe Library at Oxford.

My cousin, Obadiah Project, Esq., formerly a respectable deputy of Farringdon Ward Within, retired into the country, when he had reached his grand climacteric, upon a small estate. While he lived in town his favourite hobby-horse, which was building, had never carried him further than to change the situation of a door or erecting a chimney. On settling in his new habitation, as he was no sportsman, he found himself inclined to turn student. His genius led him to peruse books of architecture. For two years nothing pleased him so much as "The Builder's Complete Guide," Campbell's "Vitruvius," and Sandby's "Views." All these heated his imagination with the beauties of palaces and delighted his eye with the regularity of the orders, for which he felt a vague and confused fondness. He had, perhaps, no more idea of the distinction between a cornice and a colonnade than the monstrous craws. Unluckily, Sir Maximilian Barleycorn was his neighbour, who had lately erected a house upon the Italian plan. As my cousin was laying out his garden, he found that the soil was composed of a fine vein of clay. It immediately struck him that bricks might be procured at a very cheap rate. The force of inclination, combined with rivalry and encouraged by opportunity, is too powerful for man to resist. He, therefore, flew to tell his wife of the grand discovery, and inveighed with much warmth against the smallness of their parlour, the badness of the kitchen floor, and the ruinous state of the garrets. She mildly represented that they had no money to throw away upon a new house, and that the old one might cheaply be put into repair. Her remarks had just as much effect as the advice of the barber and the curate had upon Don Quixote. The next day he played Geoffrey Gambado, by taking a ride to consult Mr. Puff, the architect. Mr. Puff was confident that the old house must fall down in a day or two, and proposed the following plan for a new one, which exactly reflected my cousin's ideas. The rooms were to be all cubes. In front, a Venetian door, with a portico supported by brick pillars, with wooden capitals, and six bow windows. A balcony was proposed, but afterwards given up because it was vulgar. My cousin retired to a neighbouring cottage. The old house was pulled down, and the brickmakers began their operations. Unfortunately the wind happened to blow in such a direction as to create much annoyance with clouds of smoke from the kilns. Whilst my cousin was half-suffocated

and half-buried in rubbish, Sir Maximilian Barleycorn and his lady came to pay a morning visit. They entered the cottage just at the moment when Mrs. Project was setting the boiler upon the fire, and her husband was paring potatoes. They were obliged to perform these offices for themselves, because the only servant for whom they could find room had been turned off that morning for abusing carpenters and masons. Sir Maximilian hastily took his leave, and swore by his knighthood "that apes were the lowest animals in the creation." My cousin had calculated that, as he burnt his own bricks for home consumption, they would not be subject to any tax. An exciseman undeceived him before the house was finished, by hinting that he had incurred a heavy penalty, which he was obliged to pay. He contrived, however, to keep up his spirits by marking the progress of his house and the improvements around it. Not far from the Venetian door was a horsepond, which the genius of Project enlarged into a circular piece of water. He requested his friends to suggest the most tasty ornaments. One proposed a shepherd and shepherdess upon a pedestal in the middle; another observed that if Farmer Peascod's gander could be placed in it when company came, they would give him credit for keeping a swan; a third, whose notion of things was improved by frequent visits to Vauxhall, was sure that a tin cascade would look very pretty by moonlight. Project, not liking to take up with one good thing when four were to be had, resolved to adorn his water with them all. He soon after removed into his new habitation, long before the walls were dry. An ague and fever were the consequence of this rash step. His fever was probably increased by Puff's bill, to pay which he sold the greater part of his estate. During his illness he gradually awoke to a sense of his late imprudence, requested the forgiveness of his wife for not listening to her advice, and begged me to impress his dying injunctions indelibly on my memory:—"Never build after you are five-and-forty; have five years' income in hand before you lay a brick; and always calculate the expense at double the estimate."

### AN OLYMPIAN VICTOR.

A DESCRIPTION has been given by the *Times* correspondent of the bronze statue which was found in Rome on February 8, in the course of the excavations for the new national theatre on the brow of the Quirinal, overlooking that part of the Via Nazionale of the actual city which joins the end of the Corso and the Piazza Venezia, or the southern extremity of the Campus Martius of ancient Rome. The site was that where stood Hadrian's Temple of the Sun and Constantine's Thermæ in close vicinity to each other, and the statue was found lying in a mass of *débris*, together with some drums of small fluted columns of tufa.

Its recovery, therefore, is an event of the highest artistic and archæological interest and importance. But, more than that, it is the most important discovery of the kind that has yet been made, from the fact that it is the first complete bronze statue of undoubted Greek workmanship—that is, wrought in Greece by one of the great masters of antiquity and brought thence to Rome, probably a victor's trophy—that has yet been discovered. In Rome, of all the works of all that crowd of sculptors who wrought in bronze of whom Pliny, Pausanias, and others have left us the names. It is an iconic nude statue of a victorious athlete standing erect. The weight of the body rests upon the right leg. The left is slightly flexed. His right hand is placed behind his back in the position of that of the *Mercury* of the Belvedere. His left is held aloft, and his gaze turned towards the right. The statue is fractured cleanly across the left shoulder and the right thigh. The left knee is broken across and some pieces detached, and the right foot is rather badly shattered; but all the pieces of the statue have been found, excepting only the index finger of the raised hand and the object that hand evidently held. The bronze, particularly as regards the head, arms, and body, is in a fine state of preservation; but the legs from the knees downwards are a good deal corroded and encrusted. In point of art it is a grand piece of modelling, in which the hand of a great master has done justice to one of those splendid specimens of the human form in full training which the Olympian and other games offered to the Grecian artists. The model and the sculptor were worthy of each other. It would be difficult to over-rate the physical symmetry of the one or the talent of the other. Like all the statues of victorious athletes this is a portrait from head to foot; a life-like breathing portrait. The face is handsome and replete with animation and individuality. The sockets of the eyes are hollow, the balls having been originally of smalt or other similar material. The frontal sinus is strongly developed, giving the forehead a somewhat retreating line, and the nose is slightly aquiline. The mouth and rounded chin are particularly well formed.

It is impossible to look upon this statue, and still more to

examine it in detail, without being reminded of Pliny's description of the characteristic which marked the works of Lysippus. It answers to that description in every point. The head is small, and if the sculptor has flattered his model in any respect it has been by an imperceptible lengthening of the lower extremities, to be detected only by measurement, which gives the figure additional lightness. The details of the hair upon the head and body are rendered with peculiar care. The thighs especially, and other fleshy parts are modelled with much roundness of treatment, while the planes are not neglected; moreover this statue is peculiarly remarkable for the careful manner in which even the smallest details are treated, as for instance the creases, or crease lines, on the neck, abdomen, and elsewhere, and the folds of the flesh under the knuckle of the little finger as it closes on the palm.

This briefly is an exact description of the style in which this statue is wrought, and by turning to Pliny's "Natural History," lib. xxxiv., c. 19, you will find that what he says of Lysippus's work tallies strikingly with it.

The treatment of the hair of this athlete is very remarkable. He is a young man around whose chin the razor has not yet played. The down on the cheeks and chin has just become soft, short hair, beginning from above the corners of the mouth. This is all delicately engraved upon the bronze in a variety of gentle curves, which could scarcely have been better placed had each hair been studied. The hair under the armpits is treated in the same way. On the head the hair, cut short, is divided into slightly-curved locks corresponding in style exactly to the treatment of the hair on the head of the marble copy of the *Apoxyomenos* by Lysippus found in 1849, and now in the Braccio Nuovo of the Vatican Museum; but in this bronze each lock of hair has been carefully tooled over and finished with the graver. Above the pubes the modelling and treatment of the hair are the same, and that on the eye-brows is also well defined in relief. There is a marked similarity between the modelling of this statue and that of the *Apoxyomenos*, and taking all these things together we may be convinced that in this bronze we have before us a veritable original statue by Lysippus, the only one of the 1,500 bronze works he is said to have executed that has come to light.

On the plane just above the navel, some figures and letters of about one-third of an inch in height have been punched on the bronze with a chisel of that width, excepting one that has been incised. They read as follows:—L·VII·S·L·XXIIX. Their meaning has not yet been made out, but they have a close resemblance to the figures and signs placed on the blocks of marble and roughly hewn columns as they were sent in ancient times from the quarries to Rome, and these, in like manner, may give the number and other indications of the lot of works of art to which this belonged, and corresponded, perhaps, to the entry on the bill of lading of the galley which brought it to Rome.

In some of the places where the statue is now fractured there must have been cracks or shakes, caused probably in the transport, which had been most carefully and delicately repaired with rectangular plates of bronze with dovetail ends let into the surface of the statue, with such delicacy and care that they are not easily recognisable on close examination even now.

In one respect, that of height, this bronze differs from the statues of other athletes. Those of which we have ancient copies, including the *Apoxyomenos* by Lysippus, are all of life-size, while this stands 6 feet 10½ inches in height.

### ROMAN ARCHÆOLOGY.

A CORRESPONDENT of the *Scotsman* gives an account of his conversation with the late Mr. H. A. J. Munro, who was recognised as one of the first Latin scholars in Europe, during the few days he spent in Rome before his sudden death. He put up at the Quirinal Hotel in preference to the Angleterre, which he had frequented on his previous visits, and there, says the correspondent, I first saw him on Saturday, March 14. He looked slightly jaded, with dusky complexion, and complained of loss of appetite, but otherwise felt no impairment of strength, being quite equal to a two hours' brisk walk, and to maintaining a lively conversation. On his suggestion, we proceeded at once to the Forum, stopping on our way through the Via Nazionale to look at the Porta Fontinalis, the old Servian gate, in nearly perfect preservation from its having been enclosed by, and partly buried under, buildings apparently belonging to the end of the first century, since which date it had been disused. We passed through the Forum of Trajan, and he criticised the famous column, pointing out the futility of its ornamentation in relief, which could not possibly be seen or taken in by the spectator, whose only knowledge of the scenes and figures represented was derived from drawings. On gaining the Forum Romanum we proceeded at once to the Atrium of Vesta, and he was greatly struck with its spacious proportions and the sculptured figures

of the virgins—some of them in good preservation—with the inscriptions placed beside them, recounting their services to the sisterhood and the State. Returning into the centre of the Forum, he remarked that the German theory as to the site of the Temple of Jupiter Capitolinus—namely, that it stood on the southern peak of the hill—was not in every point substantiated, and he referred to a recent article in "Hermes" calling in question the accuracy of Jordan's measurements of the supposed sub-structure of the Temple. He admitted, however, with Burn that the direction of Caligula's Bridge from the Palatine to the southern peak of the Capitoline was a very strong argument on the German side. Jordan's style he thought detestable, and seemed inclined to think with Professor Ihne that when an Englishman, fairly familiar with the German language, has difficulty in translating a treatise in it, the fault is the author's, not his. He greatly deplored the premature closing up of the eastern side of the Forum, as its promised excavation would have cleared up many interesting questions as to the topography of the place. He passed a severe judgment on the Italian architect Rosa, whose indications of localities on the Palatine had in so many instances proved erroneous. From the Forum we rambled up the Quirinal, and parted at the house of Scanderbeg, that "hammer of the Turks" in the fifteenth century, whose likeness, full of energy and sagacity, he admired as depicted on the façade.

Next day he called on me in the Corso, and we went at once to the Palatine, where we strolled for two hours, remarking on the rapid decay of the old tufa-walls of Romulus, which, unless protected by some method, will scarcely exist by the close of the century. As we paced the magnificent tablinum, peristylum, and triclinium of the palace of Domitian, and the noble belvedere of Septimius Severus, the sight of the Alban and Sabine hills suggested excursions into those interesting uplands—one especially to Horace's farm, if only to disprove Rosa's theory, which places it on the height above and beyond Roccagiovine, instead of lower down in the valley of the Digentia. But, alas! none of those pleasant expeditions was he destined to enjoy.

## ANTIQUE CARVING AND FURNITURE.

THE object of a course of four Cantor lectures, just delivered at the Society of Arts by Mr. John Hungerford Pollen, was to revive the art of wood-carving in its application to the fittings of houses and public buildings. There were, the lecturer said, good carvers to be found in London and other towns, but their skill was no longer applied, as it had been in former times, to the walls, window-frames, fireplaces, and doorways of London and country houses. Let them look at Old London, now going fast to pieces, and see what treasures were brought from those streets and houses, and bought at high prices for the museums of our towns, or used by those whose means enabled them to fit up their rooms with fireplaces and panelling no longer made as ordinary articles of trade. This country was provided with an excellent school, rather with numbers of schools or guilds, of carvers in the Middle Ages. We saw their work in the stalls of many of our cathedrals. Those of Winchester might serve as an example of a period when Pointed architecture was at its best, or nearly so; while the figure work under the *misereres* of Henry VII.'s chapel in Westminster was not to be surpassed by that of any contemporary building on the Continent. Though executed at a period of architectural decay, those stalls were marvels of bold design, lightness, and delicacy of execution. The Renaissance was as fertile in graceful work as it was in painting and sculpture. The Kensington Museum was rich in chests, chairs, cabinets, and dressers of this fruitful period. Those of Italian make in walnut were the boldest, and showed the highest attainments as to figure sculpture on the supports and surfaces. It was there that we learnt the use made of the acanthus leaf. Not only was it of universal service in lines of moulding and the capitals of columns and pilasters, on whatever scale, but we found it married to portions of the figure, or to whole or portions of animal life, and bringing these lifelike elements into connection with borders, edges, lines of moulding, which made up the composition of furniture of this description. The general arrangement and mutual connection of the mouldings borrowed from the monuments of antiquity were never lost in the work of the sixteenth century. Their typical functions as elements of shelter or of support marked them out for upper or cornice uses, or for lower or base and dado service. Down to the latest times architects and carvers remembered and felt these proprieties, and a certain completeness and harmony were never wanting to these commonplace elements of decoration while this traditional order and connection were maintained. Moulding with the kind of decoration proper to their several contours formed, after all, the chief feature in all carving arrangement, whether in that of chimneypieces and door frames or the composition of pediments and porches. The seventeenth century, again, with its Elizabethan mansions,

most of them built during the peaceful reign of James, spoke to us of carved woodwork. The great hospital halls with their screens and fireplaces, the burly grotesque figures of support, the pierced and latticed strap-work, the massive stair newels surmounted by heraldic monsters or sculptured figures, often of great excellence, seemed to welcome us in hearty and homely language, and to remind us of the happy and noble country life and the kindly family ties of the England of old times. Gradually the influence of the splendid and pompous Court of Louis XIV. sheared away this ample and massive treatment of wood and furniture. Carved cabinets and massive stair balusters gave place to the metal and shell marquetry of Boule, to silver hammered work in the houses of the rich, and veneered woods for more modest fortunes. Of the former and its splendid surface, too much could not be said. This phase of old furniture the lecturer well illustrated by examples, objects of various shapes and uses now in private hands. Then came the age of Martin and his "Vernis," of Riesener, the metal-work of Gouthière, Chipendale, Sheraton, Heppelwhite, and many others. The graceful work of Gibbons was shown by illustrations taken from the carvings at Petworth House—musical instruments, fruits, bearded wheat, antique vases with reliefs round them, lace, medals—perhaps the most varied examples of the skill of this great artist that could now be pointed out. Sir William Chambers, like Wren and Jones, gave a special character to the wood fittings of the houses and churches which he designed. So, also, it may be said of the Brothers Adam, the architects of the Society's house in John Street, Adelphi. They designed every portion of such houses as Derby House, Grosvenor Square (now destroyed), and Lansdowne House, Berkeley Square, down to the sideboards, wine-coolers, hall tables, looking-glass frames, &c. Some hopes might fairly be entertained of the red-brick architecture now growing into fashion, and the reviving love of the fashions of the last century. Wood-carving must find its way into these structures if the taste for a past so decorative was not to prove an unreality, and there were some evidences that this branch of art was making its way once more to the front.

The lectures were illustrated by photographic transparencies projected from the magic lantern, many of them taken from the more noteworthy pieces in the South Kensington Museum.

## PETERBOROUGH CATHEDRAL.

ON the 27th ult. the Archbishop of Canterbury sat at Lambeth to arbitrate between the canons of Peterborough, who were represented by Canon Argles and Archdeacon Thicknesse, and the Restoration Committee representing Mr. Moncton and Mr. A. Percival. The *Morning Post* says: the canons contend that the sole charge of the fabric of the cathedral is vested in the Dean and Chapter, and that they have merely exercised their right as a majority of the corporation in refusing to sanction a change in the plan which all had so long concurred in adopting; that by becoming members of the Restoration Committee they never intended to divest themselves of their responsibilities as canons; that they were not obliged to follow the opinion of their architect, whose new plans were not ordered by the Dean and Chapter; and that they have endeavoured to effect a compromise. The Chapter object to the proposed change of plan with regard to the central tower as (a) breaking their engagement with subscribers; (b) as leading to greatly increased expenditure; and (c) as destroying Pointed arches introduced subsequently to the Norman period. They believe it to be their duty, as custodians of the fabric, to preserve as far as possible and reproduce all architectural changes, such as those made in the fourteenth century, which form part of the history of this cathedral and of the progress of ecclesiastical art. The Restoration Committee (with whom Dr. Perowne agrees) argues, on the other hand, that the Dean and Chapter are included in and incorporated with the Restoration Committee, and are not treated as a separate body. They admit that the original contract bound the contractor to take down the central tower and to rebuild the same in the form in which it existed; but they say that, as the works progressed, the condition of the western arch and remaining piers of the tower was found to be so bad that the architect reported it absolutely necessary to take down and rebuild them also. This gave rise to Mr. Pearson's fresh plans, and the committee entered at length into architectural details of the work. They further pointed out that the property of the Chapter is exempted by the contract from liability for the work, and that they, like similar committees, are entitled to a real voice in and control over the works to be executed. In some supplementary observations on behalf of the committee, the views of the canons throwing a doubt on the value of their resolutions because of the non-attendance of members are canvassed, and it is affirmed that if it had been understood that the function of the com-

mittee was only to collect funds, none would have been formed. They further say that the public rely largely on the skill and judgment of the architect, and his views should not be lightly disregarded; that only one subscriber has remonstrated against their proposal, and that the committee have faith in the liberality of their subscribers. The following is an important passage in their case, under the heading "Attempts at Compromise":—

"It does not appear to be denied that each member of the Chapter nominated an expert, and that afterwards another expert was selected by consent. This may account for the fact that the opinions of five appear to agree with those of the individual selectors, while that of the sixth (who was selected by the whole body) happens to coincide with the view of the committee. The canons say the new plans were not theirs, neither were they originated by the committee. They were the suggestions of the architect—devised in consequence of the discoveries made in taking down the piers—the original plans were prepared on the assumption that none of the piers would be taken down. Until they received the canons' statement the committee were not aware that the placing of a Norman arcading had originally been suggested by Mr. Pearson. This, however, shows that the idea of additions to and alterations in the tower have throughout been contemplated and suggested by the architect, and the committee think their statement is fully confirmed, that 'as the Chapter gave way on the question of the Norman arcading, the difference was reduced to the question whether the restored arches should be Norman or Pointed.'"

The *Northampton Herald* says the archbishop grasped the subject in a thoroughly masterly way, and asked questions all round. Nothing could have exceeded his patience, and both sides most heartily thanked His Grace for his great and ready kindness in undertaking the usually very thankless task of arbitrator. He said at the conclusion of the hearing that he would send his decision in writing to the chapter clerk, and that he had made up his mind as to the relation that ought to exist between the Chapter and the Restoration Committee. He had seen and examined the clerk of the works and the contractor, and had before him all plans, photographs, and models. The case on either side had been drawn and printed, and copies interchanged, and everything had been done to facilitate the proceedings, and to place everything before the archbishop.

## STRATFORD-ON-AVON PARISH CHURCH.

THE first step towards the restoration of this church, which is estimated to cost 12,000*l.*, has just been taken by the erection of a wooden structure on the north side of the choir. This is intended to represent the proposed new vestry, the object being to enable the committee and public to form an idea as to the appearance of the building if erected upon that site. A similar structure has been put up on the south side of the chancel, which is the alternative scheme. It is necessary that the precise locality of the new building should be described in the Faculty which is about to be granted by the Bishop of the diocese. Opinion seems to lean in favour of the north side of the chancel as the site of the new vestry. The doorway close to Shakespeare's tomb shows the position of the ancient sacristy, underneath which was the old charnel-house, erected in the fourteenth century, and demolished about eighty years ago. Several tons of human bones have been discovered in the crypt on this site, and it is proposed that these shall be buried elsewhere, should the committee decide upon the ancient arrangement.

### Chelsea Vestry Hall Competition.

SIR,—Being one of the competitors in the above, I think it only right and just, in fairness to others who might not have the opportunity of viewing the drawings (which are open this week to public inspection at the Cadogan Club, next Vestry Offices), to draw their attention to the fact that two out of the three sets, viz., Nos. 14 and 26, chosen by the assessor, have not complied with the instructions, having sent in coloured drawings, although it was specifically laid down that the "drawings are to be finished in line in Indian ink."

I wish to ask you, sir, what good instructions are if they are to be so flatly ignored, and also what good are "professional assessors" who allow such things in dire contradiction to the same, as I have mentioned?

FIAT JUSTITIA, RUAT CÆLUM.

### Granite.

SIR,—Geology, and more particularly chemical geology, are comparatively young sciences. It is not, therefore, very surprising that difference of opinion should now and then manifest itself among the professors; and for the sake of the truth, you may perhaps be glad to quote what the Keeper of Mining Records (R. Hunt, F.R.S.) has to say on the weathering of granite, although he differs from Professor Newberry (Tesserae, April 4):—

"It has been stated that the disintegration of granite was due to the decomposition of the feldspar, and that thus china clay (kaolin) was produced. I am prepared to prove that such was not the case, and that, so far as human observation can determine, china clay never was true granite; and also that atmospheric decomposition acting upon feldspar had never gone to the depth of 300 feet, where the finest clay is found. I have gone over miles of country strewn with feldspar."

From this we must conclude that it is an error to assume, as is often done, that the existence of kaolin is a proof that granite is perishable. The truth seems to be that, from some cause with which we are unacquainted, the formation of granite in certain parts of the earth's crust was ages ago suddenly arrested, with the result that we possess a commodity of the greatest value to industrial art. There is, of course, no practical difficulty in distinguishing granite from kaolin; and granite quarrying has been carried on upon such good principles of late years that there need be no fear of the absolute durability of the output.—Your obedient servant,

PETRUS.

## ARCHÆOLOGY.

**Chapel at Oakley Park.**—Excavations have been lately undertaken in "The Chapel Field," on the Oakley Park estate, Felton, near Ludlow, and, at about two feet below the surface, a floor laid with ornamental tiles, such as were used in ecclesiastical buildings about the fourteenth century, was discovered. On further investigation the entire foundation walls of the building were laid bare, which were 2 feet thick, forming an oblong building, 19 feet 8 inches broad by 27 feet 6 inches long. The east end is semicircular, forming an apse, the radius of which is 5 feet 8 inches, the wall here being 3 feet 10 inches thick. At the termination of the semicircle is the base of a circular pillar, 2 feet 6 inches in diameter.

## SANITARY WORKS.

**Public Baths, Stockport.**—At the award in this competition, made some months since, the design submitted by Mr. J. C. Prestwich, architect, Leigh, near Manchester, was placed first, subject to estimates for the work being obtained by the corporation within the stipulated sum of 5,000*l.*, given in the instructions to competing architects. The Sanitary Committee of the borough met on the 6th inst., when tenders were opened, the whole of which will be found in our list of tenders, the lowest and accepted being one for 4,865*l.* The work will be at once proceeded with under the supervision of the architect.

## CHURCH BUILDING AND RESTORATION.

**Farnley.**—The chief stone of St. Michael's Church has been laid. The church is built in the place of one erected in 1761, which has become too small for the requirements of the parish. It will be a stone-faced structure, with traceried windows, and will have a wood porch, buttressed sides, and picturesque outline. It is designed to suit its special position, which is surrounded by the thick belt of forest trees forming the boundary to Farnley Park. If ever the munificence of those interested in the edifice enables a tower to be added, there will be few more charming churches. The building will consist of nave, north and south aisles, chancel, organ-chamber, and vestries. All the walls of the interior will be faced with buff-coloured terra-cotta blocks supplied by the Farnley Iron Company, the surface of which will be varied by one or two bands of ornamental work. All the columns, arches, and other stonework of the interior will be of red stone. The architects are Messrs. Chorley & Connon, of 15 Park Row, Leeds; the builders being:—Masons, Messrs. Wood & Sons, Churwell; joiner, Mr. J. Taylor, Yeadon; plumber, Mr. J. Woffenden, Leeds; slaters, Messrs. Sharp & Harper, Leeds. The entire cost of the building will be about 3,900*l.*

**Corley.**—The little church at Corley, formerly belonging to the Priory of Coventry, has been reopened after restoration, carried out under the direction of Mr. John Ladds, of Chapel Street, Bedford Row, by Mr. Wright, contractor, Foleshill.

The building illustrates four distinct periods of ecclesiastical architecture. In the nave are the remains of two Saxon windows, supposed to date from the year 900, and two Norman arches, considered to date from the year 1100; the chancel is in the Early Decorated style, and the north aisle of the Late Decorated period. Over the centre of the edifice is a bell tower containing five bells, the oldest of which is said to date from the year 1350, and another from 1641.

**Manchester.**—The reredos erected in St. Matthew's Church, Ardwick, Manchester, in memory of the late and first rector, was unveiled on Saturday before evensong. The central feature is a cross of white alabaster, 6 feet high, with a background of red-veined marble, which stands under a boldly-projecting canopy, supported by two circular pillars. At either side of this central cross and canopy are two arches, with backgrounds of coloured alabaster, which contain carvings emblematical of the eight Beatitudes. On each side of the head of the canopy are five cusped arches. A battlemented cornice completes the structure at top. Immediately above the Lord's table is a shelf of red marble, and beneath the foot of the cross are carved the words, "Till He Come." The narrow spaces between the reredos and the north and south walls of the sanctuary are filled with a diaper of terra-cotta and stone. The reredos proper is 15 feet wide and 15 feet high. The entire width of the work, including the diaper at the sides, is 19 feet 6 inches. The design has been made by Messrs. Medland & Henry Taylor, architects, of Manchester, and the work has been carried out by Messrs. Earp & Hobbs, under the superintendence of the architects.

**Penningley.**—The old church of Penningley, Notts, has been reopened after restoration carried out under the direction of Mr. C. Hodgson Fowler, of Durham. The date of the foundation is supposed to be anterior to the Conquest, the south porch being a fine specimen of Saxon work; the western tower, probably 1180, opening to the nave by double doors; the chancel is a fine example of Early Decorated. Under the south window are triple sedilia and double piscina, the chancel arch showing signs of fire. On the oak altar frame has been placed the original stone mensa found in relaying the floor. The south porch has been entirely rebuilt. The cost of the work has been 1,380*l*.

**Queensbury.**—Holy Trinity Church, Queensbury, has been reopened after restoration. The additions to the church are in keeping with the style of the main structure, which is Early English. They consist of a chancel and north and south aisles. The south aisle is devoted to an organ-chamber and choir vestry, with a clergy vestry beyond. The chancel is divided into three bays, the well-moulded arches resting on clustered columns, with carved capitals; and it is lined with dressed stone. The ceiling is of pitch pine. The restoration has been carried out from designs by Messrs. Healey, architects, Bradford, former members of whose firm were the architects for the church when it was first built. The contractors were:—Masons, M. Firth & Son, Queensbury; joiners, James Wilson & Son, Bradford; plumber, B. Stocks, Queensbury; slater, James Smithies; plasterer, B. Dixon; painter, E. Harland. The iron and metal work has been supplied by Messrs. Dutton & Powers, of Manchester; the oak stalls, &c., by Messrs. Marsh, Jones & Cribb, of Leeds. Messrs. Farmer & Brindley, of London, did the stone carving.

**Scarborough.**—The memorial-stones of the Wesleyan Methodist Chapel, which is being built on the South Cliff, have been laid. The chapel is designed in the Decorated style of Gothic architecture, and will consist of nave, transepts, and chancel, which, together with an end gallery over the vestibule, will accommodate about 550 persons. A large lecture-room and two class-rooms are arranged at the back of the chancel end, the organ chamber opening into the nave and chancel with wide arches. A handsome spire will occupy a prominent position at the south-west corner. The architects are Messrs. Morley & Woodhouse, of Bradford and Bolton. The total cost, including spire, will be about 5,000*l*.

## SCHOOL BUILDINGS.

**Long Eaton.**—The memorial-stones of the new Congregational Sunday-school have been laid. The school is intended to accommodate 250, and is estimated to cost 320*l*. Mr. J. Brown, Long Eaton, is the builder, and Mr. J. Sheldon, Long Eaton, the architect.

**Dundee.**—A new public school is to be erected in the Rosebank district, and on Monday the building offers were conditionally accepted. It will accommodate 1,000 scholars, and the cost will be about 6*l* per scholar, as compared with 8*l*, the cost for schools previously erected. Mr. David Maclaren, Murraygate, Dundee, is the architect.

## GENERAL.

**M. Mallart** will exhibit at the Salon this year a picture having for subject the death of the last chief of the Gauls.

**The Aberdeen Art and Industrial Exhibition**, although visited by 54,816 people, has resulted in a slight deficit, the income having been 985*l*, and the expenditure 994*l*.

**The Duc d'Aumale** has presented the Hungarian National Gallery with an *Assumption* by Jerome Libri and a *Flight into Egypt* by Rembrandt, in exchange for an equestrian picture painted by Carle Vernet in 1782, and representing Philippe Egalité and his son, afterwards King Louis Philippe, in English hunting dress.

**Mr. Belt** has been commissioned to execute in marble a bust of the late Mr. Bass for the Liberal Club at Burton-on-Trent.

**Mr. W. J. Wood**, of Finsbury Pavement, has prepared plans for the restoration of the south aisle of Great Bursted Church, which are to be carried out as soon as approved of by the Church Building Societies.

**Mr. W. Coats** has resigned the district-surveyorship for East Kensington, and a successor will be elected on April 24.

**A Genealogical Manuscript Book**, which has been found in Berlin, contains no fewer than 150 miniatures in oil, painted for the most part on very thin plates of gold or silver, by artists whose names even have been quite forgotten—e.g. Lessnipp, Henr. Schmidt, Ed. Wittjequast, &c. Most of the miniatures are done with great delicacy, and are in excellent preservation. The book dates from the sixteenth century. It is intended to reproduce it in fac-simile, and to search for some information about the artists.

**A Reredos** has been placed in the Wilberforce Memorial Church, Southampton. It is 21 feet 6 inches long and 16 feet 6 inches high, has been executed by Messrs. Earp, Son & Hobbs, and has cost over 600*l*. It comprises five groups of sculpture, executed in high relief, in white alabaster, the same material in red, green, and dove-colour being used for the architectural surroundings.

**Lieut.-Colonel H. C. Seddon, R.E.**, has proceeded from the School of Military Engineering, Chatham, to Portsmouth, on appointment as superintending engineer at Her Majesty's dockyard at that port.

**The Severn Tunnel** is expected to be completed towards the end of the summer of this year.

**A New Church** at Addiewell, N.B., has been opened. It was erected from the designs of Mr. David Thomson, of Glasgow.

**An Examination** in architecture has been held in Manchester by the Manchester Society of Architects, acting with the Royal Institute of British Architects, when the following gentlemen were declared eligible for the associateship of the Royal Institute of British Architects:—Messrs. Benson, Paul Ogden, Norman Spencer, W. E. Willink, and Edgar Woods.

**Sir John Coode**, who was appointed referee in a dispute between Mr. Lawson, late contractor for the deepening of Peterhead south harbour, and the Harbour Trustees, has made his award. Mr. Lawson claimed 16,350*l*. including interest, and this sum Sir John Coode has reduced to 6,892*l*. The Harbour Trustees, however, have to pay the expenses, which are expected to amount to nearly 2,000*l*.

**A Tower and Spire** have been added to the parish church, Poynton, Cheshire, from the designs of Messrs. Medland and Henry Taylor.

**Lord Coleridge** has purchased the large building in Ottery St. Mary, which for nearly a century has been used as a silk factory.

**A Bridge** is to be constructed over the River Tarff, which is to be called the "Glentilt Bedford Memorial Bridge." It will be a memorial of a captain of St. Paul's School, who was drowned in 1879 when attempting to ford the river.

**The Board of Trade** have refused to grant a provisional order applied for by a Birmingham company, to supply Holywell and Greenfield with water to be abstracted from St. Winifred's Well. It was proposed to abstract 1,500,000 gallons of water, between Saturday and Sunday nights only.

**A Chapel** is proposed to be erected at Wednesfield at a cost of about 1,500*l*, the site for which has already been purchased.

**The late French Government** proposed to expend 879,000,000 frs. on public works, of which 713,000,000 frs. were for canals, 100,000,000 frs. for ports and harbours, and 66,000,000 frs. for rivers, and, in addition to this amount, there has been a supplementary grant of 100,000,000 frs. for the ports and 30,000,000 frs. for the canals. Havre is to have 100,000,000 frs. spent upon harbour works, and Bordeaux 20,000,000 frs.

**The Winter Gardens** erected by the South-Eastern Railway Company in connection with the Pavilion Hotel at Folkestone, were opened last week.

A Business Supplement

# The Contract Reporter.

to The Architect.

LONDON, APRIL 11, 1885.

## TENDERS, ETC.

As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 5 p.m. on Thursdays.

Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—*"Contract Reporter to THE ARCHITECT."*

## NOTICE TO THE PUBLIC.

By the Post Office arrangements THE ARCHITECT can now be sent to any part of the United Kingdom by an affixed Halfpenny stamp; hitherto the postage has very frequently been twopence per copy. The Publishers will be happy to forward, for 19s. 6d. per annum, post paid, THE ARCHITECT, to residents in towns and neighbourhoods to which there is no easy access by railway. Terms for the half-year, 10s.

Our readers are invited to address us on subjects of interest to themselves or the public. We shall be always ready to insert letters asking for a solution of any suitable questions of a professional or practical nature, and to receive replies to such inquiries.

## ADVERTISEMENT SCALE.

|                           |        |

On pages preceding and following matter, special rates.

Public Companies' Advertisements, 12l. 12s. per page; 1s. per line.

Special arrangement may be made for a series of insertions on application to the Publishers, at the Office, 175 Strand, London, W.C.

## EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

## BURNTISLAND HARBOUR.

NEW sidings and an embankment wall have now been completed at Burntisland at a cost of 2,800l. The south hoist on east quay of dock and enlargement of return mains were provided by Messrs. Armstrong & Co. for 751l.; and the same firm substituted an iron framework on an extended scale at No. 1 hoist for the decayed wooden frame, raising the lift from 15 to 22 feet, at an expense of about 927l. Standpipes and tanks have been furnished for Nos. 1, 2, and 3 hoists for relieving the back pressure of the return mains, and expediting the lowering of the "lifts." A new and ornamental chimney of 100 feet in height is being raised at the engine-house at an estimated cost, with brick flues, of 200l. Repairs on the dock-heads are almost completed, at an expenditure amounting in the aggregate to 800l. The masonry has been thoroughly tied back with strong iron rods fixed to concrete blocks, which is expected to obviate the shifting and cracking of the walls in this exposed quarter. The work of replacing the old cofferdam by a substantial stone quay wall running parallel with it, but taking in other 25 feet of the tidal basin, is being carried out in successive contracts by Mr. Thomas Chalmers. This wall is founded on bearing-piles driven down through clay and mud, a foundation being thus secured at 34 feet from cope level. It is built with rubble concrete, faced with ashlar, and the remaining 600 feet is intended to be proceeded with until a junction is formed with the embankment at the head of the tidal harbour. The works have all been designed and superintended by Mr. R. Henderson, the resident engineer.

## PRUSSIAN METAL TRADES.

DURING 1883 the number of iron furnaces in blast was 194, against 192 in the previous year, while 45 were out of blast. The production averaged 13,278 tons per furnace, as against 12,589 in 1882. Copper showed a yield of 16,734 tons, as against 12,836, the majority of the production being furnished by the Mansfeld Company, which has extensive mines and smelting works, employing in the aggregate over 15,000 hands. As much as 68,463 kilo-

grammes of silver was produced by the same company. There was also a considerable increase in the yield of zinc, there being 116,644 tons of spelter, against 113,271 in the year before. Two-thirds of the amount came from Silesia, which contains 22 zinc smelting works.

## STEAM-DRYING OF TIMBER.

AN invention has been introduced into England by Mr. P. Parsons which is expected to expedite the process of drying timber. An apartment, or several connected compartments, are so constructed that they can be tightly closed and heated to the temperature required, the heating agency being exhaust or live steam. Where the former is used connection should also be made with the boiler, so that when the mill is closed at night, by opening a valve steam from the boiler may pass into the kiln's pipes, thereby preserving the temperature in the kilns over night. Uniform temperature as well as uniform action is essential. Sweating the timber is the first step in drying, and is done at the start by opening a valve in one of the pipes, governed from without, ejecting a spray of steam on to the timber while there is a little heat in the pipes. This facilitates the action of drying, and enhances the quality. The action is similar to that of immersing timber in water, or of floating logs. It dissolves the sap, which is of a glutinous or spongy nature, and the natural moisture at the centre escapes freely, and the wood comes together more compactly and firmer than if sap is suffered to dry down as in seasoning ordinarily.

An exhaust fan is now used to draw the heated, moisture-laden air from the room or kiln, and force it through a cylinder condenser back to the room. The condenser extracts from the air, thus drawn out, its moisture, which, liquefied, is discharged through a waste-pipe, while the air, now dry, passes back to the kiln, and being rapidly heated by the heat radiated from the steam pipes at the bottom, its capacity for moisture is thereby greatly increased, and the moisture is more freely extracted from the timber in its circulation through the apartment. The air when again charged with moisture from the sweating timber, is drawn out, and thus the circuit is continually made until the timber is thoroughly dry.

The relative humidity is changed so continuously and gradually by this action that the effect is said to be excellent. Warping and checking are prevented—a result well-nigh impossible heretofore. The timber is left natural, the surface is not hardened or baked, as in dessication. By this process, too, the timber, being kept in moisture of heat while it is being dried, is seasoned perfectly inside, without any of that "honeycomb" or "heart check" which often appears in thick stock dried in the ordinary dry-house. Sap, if allowed to dry down in timber, always remains a ready absorbent of moisture. Dissolve the sap at the first, and the timber will be much better in quality, and ever remain in position when worked.

The method is simple, and this has been the inventor's aim from the start, as well as to follow closely in the steps of nature. First, heating the material to a mean temperature of 125 degrees, and maintaining it, with none of the detrimental effects of sudden atmospheric changes. Secondly, circulation of air by means of the fan. Thirdly, condensation, or removal of the moisture.

### THE AMALGAMATED SOCIETY OF CARPENTERS AND JOINERS.

In his report for the year 1884 the general secretary of this Association (Mr. J. S. Murchie) states that during the year thirty-three new branches were opened—sixteen in England, two in Ireland, seven in the United States, five in Australia, one in Tasmania, and two in Southern Africa—and three were closed owing to depression in trade. There is now a total membership of 24,784—a gain during the year of 1,945. The net income for the year was 59,317*l.* 1*s.* 6*d.*, and the net expenditure 57,933*l.* 7*s.* 3½*d.*, leaving a cash balance of 57,253*l.* 2*s.* 8*d.*, or an increase of 1,383*l.* 14*s.* 2½*d.* The total funds, buildings, and other property, which have been carefully revalued, stand at 63,270*l.* 6*s.* 0½*d.*, or 2*l.* 11*s.* 0¾*d.* per member. In unemployed benefit the Society has expended 23,262*l.* 0*s.* 1*d.*, or 18*s.* 9½*d.* per member, as against 14*s.* 0¾*d.* per member in the previous year. This shows a decided falling off in trade, but compares very favourably with 1879, when the amount per member reached 1*l.* 12*s.* 9*d.* In sick benefit there has been expended 14,852*l.* 8*s.* 8½*d.*, or 11*s.* 11¾*d.* per member. Compensation for tools lost by fire, water, or theft cost 1,641*l.* 1*s.* 4½*d.*, or 1*s.* 3¾*d.* per member. Accident benefit cost 1,450*l.*, or 1*s.* 2*d.* per member. For the four years previous to the commencement of the Employers' Liability Act this benefit cost 6*s.* 5¾*d.* per member, and for the four years subsequent to the Act coming into operation it had cost 4*s.* 10½*d.* per member. "This," it is observed, "cannot help but

furnish a most substantial argument in favour of the Act, and to the necessity of its being renewed at its expiration." In superannuation benefit the Society has expended 2,003*l.* 10*s.* 2*d.*, or 1*s.* 7¾*d.* per member—an increase from 1*s.* 3¾*d.* in 1883. In trade privileges—an item which covers the whole of the expenses of trade movements, whether of a hostile or peaceful character—there has been expended 2,140*l.* 15*s.* 4½*d.*, or 1*s.* 8¾*d.* per member. Contingent and benevolent grants have amounted to 960*l.* 17*s.* 8*d.* This has been paid in extra relief to distressed members, or the widows and children of deceased members whose cases have been recommended to the Executive Council after investigation by the branches. In grants to other trades there has been expended 154*l.* 5*s.* 9½*d.*, and in funerals 2,499*l.* 10*s.* The total amount expended in the above benefits since June 1860—the date of the formation of the Society—is 500,799*l.*, or 43*l.* 0*s.* 9½*d.* per member.

### HEATING AND VENTILATION.

MR. E. H. SHORLAND, of St. Gabriel's Works, Manchester, is now supplying his patent Manchester grates and Manchester stoves to the new Board School, Stanwix; Infirmary, Bradford; Board Schools, Skipton; Industrial Schools, Witton Gilbert; new Seaman's Barracks, Devonport; Central Station, Liverpool; Central Station, Warrington; Sedburgh Grammar School Sanatorium; Cottage Hospital, Maidenhead; Manchester, Sheffield, and Lincolnshire Railways Co.'s new Offices, Manchester; National Provincial Bank of England, Manchester; Masham Grammar School; new Schools, Lincoln; new Schools, Wrexham; and numerous other public and private buildings.

Mr. Shorland has just received a letter from Messrs. Edgington & Summerbell, architects, of Windsor, saying that the vertical ventilating tubes supplied by him to the British Orphan Asylum, Slough, the Windsor Infirmary, and other places, are acting exceedingly well and giving every satisfaction.

### COMPETITIONS OPEN.

**BOOTLE.**—May 1.—Plans and Specifications are invited for the proposed Erection of Public Baths. Mr. J. Alexander, Borough Surveyor Bootle.

**WIMBLEDON.**—Plans are invited for proposed Free Library. Mr. W. H. Whitfield, 5 Southampton Street, Bloomsbury, W.C.

### CONTRACTS OPEN.

**ABERDEEN.**—April 13.—For Building Church at Rothiemurchis. Mr. D. M. Millan, Architect, 4 Dee Street, Aberdeen.

**ABERDEEN.**—April 14.—For Building Dwelling-house at Upper Tillydrine. Messrs. Jenkins & Marr, Architects, 16 Bridge Street, Aberdeen.

**ABERDEEN.**—April 14.—For Station Building at Brickie, Nether Buckie, Portgordon and Pochabers, on Great North of Scotland Railway. W. Moffatt, Secretary.

**ABINGDON.**—For Building Corn Exchange. Mr. Charles Bell, Architect, Dashwood House, 9 New Broad Street, E.C.

**ARDEE.**—April 14.—For Cooking Range for 200 Persons. Mr. T. B. Drumgoole, Ardee Workhouse, Ireland.

**ARMAGH.**—April 11.—For Fitting Laundry with Steam Engine, Boilers, Drying Closet, Hydro-extractor, Wringing Machine, &c. Mr. J. Boyd, Architect, 9 Donegall Square West, Belfast.

**ASCOT.**—April 13.—For Supplying and Laying Cast-iron Pipes (16 miles), with Branches and Irregulars. Mr. A. W. Rixon, Solicitor, 10 Austin Friars, E.C.

**ATHERSTONE.**—April 20.—For Alterations, Reseating, &c., Congregational Church. Messrs. Ingall & Hughes, Architects, Temple Row West Birmingham.

# R. ADAMS,

17 BLACKMAN STREET & 7 GREAT DOVER STREET, LONDON, S.E.,  
INVENTOR and PATENTEE of the  
SAFETY WINDOW WITH REVERSIBLE SASHES

### FOR INEXPENSIVE & PERPETUAL CLEANLINESS

Which has gained at the INTERNATIONAL HEALTH and  
SANITARY EXHIBITIONS

2 Gold, 4 Silver, and 4 Bronze Medals,  
and 16 Diplomas of Merit.

The fearful sacrifice yearly of Life and Limb of persons in cleaning windows through sitting or standing outside whilst so engaged is most appalling. This can now be entirely prevented. The Patentee, having given this subject the most exhaustive study, is now prepared to supply his patent fittings suitable both for old and new windows at prices to meet the means of all. These improvements are protected by several patents, by each of which the outside of each sash can be reversed for cleaning, and under this new system that duty is rendered a pleasure, whilst the danger, risk, and tremendous responsibility of moral and statute law is removed.

These patent fittings can be procured from 5*s.* for each sash, and all builders have the right conferred upon them to fit the same in the purchase thereof, and that all shall have the benefit of this national boon, special Agencies are being established throughout the United Kingdom. None but practical and responsible firms are appointed. Such firms are invited to apply for unrepresented districts at once, as it is desirable to complete the list as soon as possible.

The present representatives are:—

|  |  |

ATHERSTONE.—April 11.—For Construction of Waterworks (Engine and Boiler-houses, Chimney Shaft, &c., Reservoir) and Supply of Iron Pipes, Engines, Boilers, &c. Mr. Baldwin Latham, C.E., 7 Westminster Chambers, S.W.

AVONMOUTH.—April 16.—For Construction of Temporary Hospital. Mr. F. Ashmead, C.E., Surveyor, 13 Prince Street, Bristol.

BALDON.—April 14.—For Building Schools. Mr. C. S. Nelson, Architect, Albert Chambers, Park Row, Leeds.

BATLEY.—April 23.—For Enlargement of Blenheim House. Mr. W. Hanstock, Architect, Branch Road, Batley.

BELFAST.—April 13.—For Building School-house. Mr. Henry Seaver, B.E., Architect, 35 Royal Avenue, Belfast.

BELFAST.—April 25.—For Building Shops and Dwelling-houses. Mr. Henry Seaver, B.E., Architect, 35 Royal Avenue, Belfast.

BERMONDSEY.—April 16.—For Additional Water-closets, Lavatories, Bathrooms, and Relief Offices at the Workhouse, Tanner Street. Messrs. H. Saxon Snell & Son, Architects, 22 Southampton Buildings, Chancery Lane.

BICTON.—April 13.—For Building Church. Mr. A. E. Lloyd Oswell, Architect, Dana Chambers, Shrewsbury.

BIRKENHEAD.—April 15.—For Pulling-down and Rebuilding Brick and Stone Boundary Walling (340 yards) at Workhouse, Tranmere. Mr. Thos. C. Thorburn, C.E., Borough Surveyor, 35 Hamilton Square, Birkenhead.

BIRMINGHAM.—April 20.—For Laying Wood Paving (5,000 to 6,000 square yards) in Corporation Street. Mr. Wm. Till, Borough Surveyor, Council House, Birmingham.

BOGTHORN.—April 18.—For Rebuilding Two Dwelling-houses. Mr. John Judson, Architect, Bogthorn, near Keighley.

BOSTON.—April 12.—For Excavation of New Cut and Sea Sluice. Mr. R. W. Staniland, Clerk of Sewers, Boston, Lincolnshire.

BOURNEMOUTH.—April 14.—For Building on Pierhead 250 feet run of Shelters, &c., Wind Screens of Wrought-iron Girders, Plate-glass, Zinc Roofing and Woodwork, &c. Mr. R. W. Peregrine Birch, C.E., 2 Westminster Chambers, Victoria Street, S.W.

BRISTOL.—April 16.—For Building Fence and Boundary Walls, Providing Iron Railing, &c., at Pleasure Ground, Mina Road. Mr. F. Ashmead, C.E., Surveyor, 13 Prince Street, Bristol.

BUTTERKNOWLE.—April 16.—For Building Chapel at Copley. Mr. H. T. Neilson, 7 Horse Market, Darlington.

CAMBERWELL.—April 15.—For Building Mortuary. The Surveyor, Vestry Hall, Peckham Road, Camberwell.

CARDIFF.—April 16.—For Building Thirty-four Shops with Cellars, Offices, &c. Mr. J. P. Jones, Architect, 27 Park Street, Cardiff.

CARLISLE.—April 21.—For Building Boundary Wall, Entrance Gateway, &c., Roadway Bridge, and Abutments for Footbridges, Diversion of Fairy Beck, &c. Mr. Isaac Cartmell, Clerk to the Burial Board, Town Hall, Carlisle.

CHATHAM.—April 16.—For Alterations and Additions to Fire-engine Station, Military Road. The Surveyor, Local Board Offices, Chatham.

CHELSEFIELD.—April 16.—For Building Schools, with Master's Residence, &c. Mr. G. St. Pierre Harris, Architect, 1 Basinghall Street, E.C.

CHESTHILL.—April 20.—For Additions and Alterations to Invervar Lodge and Steading. Mr. John Hamilton, Chesthill, Fortingal, N.B.

CLAYTON.—April 17.—For Building Four Houses. Mr. J. Drake, Architect, Winterbank, Queensbury.

CLEATOR MOOR.—April 11.—For Building Hotel, Seven-stall Stable, and Coach-house. Names, &c., to be sent to Messrs. Pickering & Crompton, Architects, 11 Lowther Street, Whitehaven.

COCKERMOUTH.—April 16.—For Building Printing and Publishing Offices for *West Cumberland Times*. Mr. R. S. Marsh, Surveyor, Cockermouth.

DERBY.—April 24.—For Extensive Additions and Alterations to the Railway Servants' Orphanage Buildings, Ashbourne Road. Mr. Thomas Hall, Secretary, Railway Servants' Orphanage, Ashbourne Road, Derby.

DUKINFIELD.—April 15.—For Building Stores, Lecture-hall, &c. Messrs. J. Eaton & Sons, Architects, Ashton-under-Lyne.

EASTINGTON.—April 22.—For Works at Parish Church. Messrs. Waller, Son & Wood, Architects, 17 College Green, Gloucester.

FENTON.—April 28.—For Supply of 36-inch Station Governor, with Inlet, Outlet, Valves, and Connections. Mr. James Stelfox, Engineer, Gasworks, Manager, Belfast.

FERNDALE.—April 16.—For Building Billiard-room and Alterations to Commercial Hotel. Mr. J. Williams, Architect, 3 and 4 Edward Street, Morgantown, Merthyr.

GALWAY.—April 15.—For Building Constabulary Barrack. Mr. W. B. Soady, Office of Public Works, Dublin.

GALWAY.—April 15.—For Building Post Office. Mr. W. B. Soady, Secretary, Office of Public Works, Dublin.

GLASBURY.—For Building Vicarage. Mr. E. H. Lingen Barker, Architect, 6 King Street, Hereford.

GREENOCK.—April 27.—For Supply of Two Sample Hydraulic Travelling Cranes (3 tons and 1½ ton), &c. Mr. W. R. Kinipple, C.E., 17 West Blackhall Street, Greenock.

GORLESTON.—For Building Two Dwelling-houses. Mr. G. Baker, Architect, Queen's Road, Yarmouth.

HALIFAX.—May 1.—For Building Eight Dwelling-houses. Messrs. Geo. Buckley & Son, Architects, Waterhouse Street, Halifax.

HASLINGDEN.—April 20.—For Formation of Circular Reservoir. Mr. T. Woodcock, Clerk to the Guardians, West View, Haslingden.

# RENDLE'S ACME GLAZING

(REGD)

Patentees:—**W. E. RENDLE & CO.,**  
3 WESTMINSTER CHAMBERS, VICTORIA STREET, LONDON.

ROYAL MUNICH STAINED GLASS  
ESTABLISHMENT.

**MAYER & CO.,**

149 NEW BOND STREET, LONDON.

Only Best Pot Metal Glass and no Etamelling used.

## CONTRACTS.

**THE LONDON GUARANTEE & ACCIDENT COMPANY** issue Bonds, security on behalf of a Contractor or Builder for the due performance of Government, Municipal, or other Contracts of every description, at moderate rates. On application, leave will be given to send in the Company's name as surety with any Tender, no charge being made unless the bond is ultimately required. For terms, &c., apply to the Office, 10 Moorgate Street, London, E.C.

The Bonds of this Company are accepted by the several Government Departments.

**NORTHERN ASSURANCE COMPANY.**  
Established 1836.

FIRE AND LIFE. AT HOME AND ABROAD.

London: 1 Moorgate Street, E.C. Aberdeen: 3 King Street.

side. FIRE, LIFE, ACCIDENT. Established 1808.

Moderate rates. Prompt settlements. Liberal conditions.

SAML. J. PIPKIN, Secretary.

TO  
ARCHITECTS, BUILDERS,  
AND  
CONTRACTORS.

**STEEL CUT NAILS!!**

The modern and important discovery in the process of making Steel has so reduced the price, that Steel Cut Nails of the well-known "Mitre Brand" can now be supplied at only 1s. 6d. per cwt. more than the price of the ordinary Common Iron Cut Nails.

The Steel Cut Nails are far superior in quality and more uniform in size than any wrought or hand-made Nails yet produced, and being lighter in weight than ordinary Iron Cut Nails and free from rust, they are found cheaper in actual use than common Iron Cut Nails at 1s. 6d. per cwt. less.

These Steel Cut Nails are specially suited for Builders, Joiners, Coopers, Packing-Case Makers, &c., and a single trial is sufficient to convince any one of their superior quality and cheapness.

**PATENT WROUGHT STEEL NAILS.  
OVAL WIRE NAILS.**

Ask your Factor or Ironmonger for  
"MITRE NAILS."  
WHOLESALE AND EXPORT ONLY.

FIRST-CLASS CERTIFICATE AND SILVER MEDAL  
AT CALCUTTA EXHIBITION.

**SAND. SAND.**

BEST AND CHEAPEST FOR BUILDERS' PURPOSES.  
Guaranteed Sharp and Clean.

For sample, price, railway and canal rates, apply to  
**E. J. BISHOP & SONS, Sand Pits, Leighton Buzzard**

## BOOKS.

Just Published,

Crown 8vo. 104 pp., handsomely bound in cloth, price 2s. 6d.; and in fine paper covers, 1s.

**ROBERT BOYLE,**

INVENTOR AND PHILANTHROPIST

(Founder of the profession of Ventilation Engineering).

By **LAWRENCE SAUNDERS.**

London: GILBERT WOOD & Co., 175 Strand.

Just published, 12th Edition, royal 32mo., roan, gilt edges, 4s. 6d.; or cloth, 3s. 6d.

**SPONS' ARCHITECTS' and BUILDERS' POCKET-BOOK OF PRICES and MEMORANDA for 1885.** By W. YOUNG, Architect, Author of "Picturesque Architectural Studies," "Town and Country Mansions," &c.

An accurate and reliable Price-Book for Bricklayers, Carpenters and Joiners, Masons, Painters, Plumbers, Slaters, Smiths and Founders, Zinc-workers, Bell-hangers, Paper-hangers, Glaziers, &c. With numerous Memoranda useful to the Building Trades generally. The most comprehensive Price-Book published.

London: E. & F. N. SPON, 125 Strand.

Now ready, price 4s.

**LAXTON'S BUILDERS' PRICE BOOK for 1885.** Containing above 72,000 prices for the use of Architects, Surveyors, and Contractors; the Act, with Notes of Cases, &c., on the Building Act.

Laxton is the acknowledged standard to which in disputed cases in the various Law Courts reference is made.

London: KELLY & Co., 51 Great Queen Street, W.C.; and SIMPKIN, MARSHALL & Co., Stationers' Hall Court, E.C.

**HUDDERSFIELD.**—April 15.—For Alterations at County Court. Mr. A. B. Mitford, Secretary, H.M. Office of Works, 12 Whitehall Place, S.W.

**HUDDERSFIELD.**—April 16.—For Rebuilding Warehouse. Messrs. John Kirk & Sons, Architects, Huddersfield.

**HULL.**—April 16.—For Water Main Piping (2,000 tons). Mr. D. Maxwell, C.E., Town Hall, Hull.

**IPSWICH.**—April 21.—For Building Shops and Offices. Mr. Wm. Eade, Architect, Post-office Chambers, Ipswich.

**JARROW.**—April 25.—For Building Board School. Mr. J. H. Morton, Architect, South Shields.

**KNARESBOROUGH.**—April 13.—For Taking Down Three Houses and Building New House. Mr. W. Clemishaw, Finkle Street, Knareborough.

**KNIGHTON.**—April 16.—For Building Pair of Houses, Bridge Street. Mr. W. R. Edwards, Skyberry, Knighton, Radnorshire.

**LANCASTER.**—April 22.—For Additional Farm Buildings at the Royal Albert Asylum. Mr. James Diggens, Secretary, Royal Albert Asylum, Lancaster.

**LERWICK.**—April 11.—For Building Combination Poor-house. Names to be sent to Mr. Wm. Calderhead, Secretary, Parochial Board Office, Lerwick, Shetland.

**LONDON.**—For Building Small Suburban Houses. Messrs. E. S. & H. Boosey, Architects, 3 Langham Place, Regent Street, W.

**LONGTON.**—For Building Church. Mr. J. E. K. Cutts, Architect, 28 Southampton Street, Strand, W.C.

**LUGWARDINE.**—April 25.—For Building Vicarage. Mr. T. Nicholson, Architect, Hereford.

**MALAHIDE.**—April 22.—For Building Coast-guard Station. Mr. W. B. Soady, Office of Public Works, Dublin.

**MONMOUTH.**—April 14.—For Building Passenger Station, Rogiet Junction. The Engineer, Paddington Station.

**MOTTRAM.**—April 13.—For Supplying and Fixing Choir Stalls to Chancel of Church. Messrs. Weaver & Adye, Architects, Town Hall Chambers, Bradford-on-Avon.

**MUCHALLS.**—April 11.—For Building Villa. Mr. John Rust, jun., Architect, 4 Bridge Street, Aberdeen.

**NEWPORT.**—April 29.—For Construction and Erection of Six Purifiers (20 feet square), with Centre and other Valves, and Travelling Lifts, for Gasworks, Crindau. The Engineer, Gas Offices, Mill Street, Newport, Mon.

**NORWICH.**—April 15.—For Building Bullock Lodge, Turnip-house, &c., on Farm, Halvergate. Mr. Arthur J. Lacey, Architect, Orford Hill, Norwich.

**PETERBOROUGH.**—For Building Small Villa. The Prince's Street Engineering Works, Peterborough.

**POPLAR.**—April 11.—For Building Dwelling-houses for Pier-master and Crew. Messrs. A. & C. Harston, Architects, 15 Leadenhall Street, E.C.

**RATHMINES.**—April 14.—For Enlargement of Parish Church. Mr. A. Jones, Architect, 43 Stephen's Green, Dublin.

**RESOLVEN.**—April 27.—For Construction of Reservoir and Laying Water Mains. Mr. W. E. Thomas, Surveyor, 58 Water Street, Neath.

**ROTHERHAM.**—April 13.—For Erection of Public Baths and Free Library. Mr. H. L. Tacon, 11 Westgate, Rotherham.

**SHEFFIELD.**—For Building Drill Shed, Armoury, &c. Mr. W. H. Lancashire, Architect, 6 George Street, Sheffield.

**SILVERTOWN.**—April 20.—For Building Detached Private Dwelling-house. Mr. J. O. Cook, Architect, 24 William Street, Woolwich.

**SOMERSHAM.**—April 23.—For Building Organ Chamber to Parish Church. Rev. A. Kirke Smith, Somersham, Hunts.

**SOUTHPORT.**—April 16.—For Erection of School for 489 Children in Swire and Bury Roads, Birkdale. Mr. C. A. Atkinson, Architect, 35A Castle Street, Liverpool. Mr. H. S. Threlfall, Clerk to the School Board.

**SOUTH MILTON.**—April 11.—For Restoration of Church at South Milton. Archdeacon Earle, West Alvington, Kingsbridge.

**SOWERBY BRIDGE.**—April 14.—For Building Fireproof Mill, and for Cast-iron Work or Rolled Iron Beams for same. Messrs. Stott & Sons, Architects, 12 Clegg Street, Oldham.

**SPARKBRIDGE.**—April 14.—For Building Bobbin Mill. Mr. J. Y. McIntosh, Architect, Barrow-in-Furness.

**SWANSEA.**—April 21.—For Alterations and Additions to Morrision Board School. Mr. E. Sidney Hartland, 5 Rutland Street, Swansea.

**SYDNEY.**—June 1.—For Steel Bridge to Carry Double Line of Railway over the River Hawkesbury. Mr. S. Samuel, Agent-General for New South Wales, 5 Westminster Chambers, S.W.

**TEAM COLLIERY.**—April 16.—For Building Chapel and School. Mr. William Thompson, Architect, 4 Western Terrace, Chester-le-Street.

Cream, Fumigators, &c., &c.

AS SUPPLIED TO 600 PUBLIC HEALTH  
BODIES.

The Sanitas Co., Limited, Bethnal Green, E.

## GRUNDY'S PATENT WARM-AIR VENTILATING FIRE GRATE.

The novelty, superiority, and advantage of this patent consist in the heating surface being greater than any other Fire-grate introduced to the public. It is very simple in construction, and is made in the form of a Stove, the back of which is semicircular in shape, with gills behind and smoke-nozzle on top, all cast in one piece. The same can be attached to any design of a Register or Stove front. It is very suitable for schools, class-rooms, waiting-rooms, hospitals, offices, dormitories, and dwelling-houses, from the cottage to the mansion. Design and specification post free on application.

### TESTIMONIALS.

"9 Victoria Chambers, Westminster, S.W."

"June 10, 1884."

"SIR,—I have much pleasure in testifying to the efficiency of your patent Warm-Air Fire Grate. It has been very successful, and given every satisfaction where I have used it."

Yours, &c.

JAMES WEIR, F.R.I.B.A."

"Baptist Chapel, Clapham Common, London. Richard Webb, Pastor, 10 Grafton Square."

"February 15, 1884."

"DEAR MR. GRUNDY,—I have pleasure in testifying to the excellency and efficiency of your patent Fire-Grate. It is the most charming invention for heating a large room I have ever known. I shall have pleasure in showing it to anyone who wish to have their schools or rooms pleasantly and efficiently heated."

From James Garry, Esq., Architect, West Hartlepool,

July 1884.

"DEAR SIR,—I have very great pleasure in stating that the first stove, or patent warm-air ventilating fire grate, adopted by me in school at Seaton, and a second in a Cocoa Palace, have given such satisfaction that I now order eleven to be inserted in New Upper Grade Schools in course of erection at West Hartlepool. They are the most economical, efficient, and easily managed stove at present before the public."

"Mr. John Grundy."

From Hon. and Rev. G. G. C. Talbot, M.A., Withington, Cheltenham.

"DEAR SIR,—You will be gratified to hear that the school is completely warmed by your new grate. It is the most economical and efficient that I have ever seen."

"Mr. John Grundy."

From F. J. Yates, Esq., Architect, Birmingham.

"The best of the kind I have seen. I shall have pleasure in securing their adoption whenever opportunity offers."

# THE "HARDING" VENTILATING COMPANY,

30 EAST PARADE, LEEDS.

## HARDINGS' PATENT AIR DIFFUSER

FOR VENTILATING ALL KINDS OF BUILDINGS.

Mr. T. PRIDGIN TEALE, F.R.C.S., M.A., Surgeon to the General Infirmary at Leeds, says of Hardings' Diffuser in his book called "Dangers to Health":—"I am satisfied that by means of this apparatus, we can secure in a town freshness of atmosphere, absence of draught, and exclusion of dirt."

The fresh air is conducted through a grate and aperture in the wall, as shown on section, about 7 feet 6 inches above the floor level; it is then conveyed through the filter, and passed into the room through a series of small tubes placed at an angle of about 30 deg. with the wall.

By these means the currents of air rushing into the apartment are compressed whilst passing through the tubes. The currents of air, as soon as liberated, expand, cut into, and break each other up, and diffuse in all directions so effectually that no draught or chilly sensation can possibly be experienced by the occupants, and at the same time a large volume of pure air is constantly being admitted and dispensed evenly through the apartments.

**CHURCH WALL VENTILATOR.**—As used in the ventilation of Archbishop Zouche's Chapel, York Minster.

The **DEAN OF YORK**, with reference to the ventilating of Archbishop Zouche's Chapel at York Minster, says:—"I think the ventilation is perfectly successful, and all I have spoken of about it are well satisfied with it, and much pleased with the result."

**OUR PATENT EXTRACTOR** is the best in the Market, and is supplied at a very much lower price than any other.

**CHURCH WINDOW VENTILATOR.**—These Ventilators are used for Churches, Chapels, and other Public Buildings where it is not desirable to have holes cut through the walls to admit air in the usual manner. The appearance is not more noticeable than the ordinary Hopper Ventilator so frequently seen.

"GENTLEMEN,—I have pleasure in stating that in my opinion your system of ventilation, introduced in our Church this summer, is a decided success. Heretofore when the Church has been well filled at the Evening Service, I have been almost exhausted by the effort of speaking before I have got half through. On Sunday night, October 7, at our Harvest Thanksgiving, we had a very large congregation, and I preached without the least feeling of weariness or exhaustion. I shall be glad to hear that your Air Diffusers are being widely adopted.—I am, yours truly, JOHN GREGORY, Minister of Oak Road Congregational Church, Leeds."

These Ventilators are more suitable for Schools, Warehouses, and other Buildings where cheapness is an object. The result is precisely the same as in our other styles, at a very much smaller cost.

A reduction in price is made where a number of Diffusers is required.

Estimates and further information given on application to the "HARDING" VENTILATING CO., 30 East Parade, Leeds.

Air Extractor.

# ROBERT BOYLE

Inventor and Philanthropist

(FOUNDER of the PROFESSION of VENTILATION ENGINEERING).

BY

## LAWRENCE SAUNDERS.

"Thoughtfully written, and will well repay perusal. . . . We can with confidence advise our readers to obtain the book for themselves. It is full of interest as an account of a useful and benevolent life, and is also a very complete record of the progress of science in dealing with the difficult subject of Ventilation."—ARCHITECT.

LONDON: GILBERT WOOD & CO., 175 STRAND.

Will shortly be Published,

A NEW WORK, TREATING UPON

## VENTILATION, SANITATION, & HEATING.

ILLUSTRATED

WITH NUMEROUS PLATES.

BY ROBERT BOYLE,

**THE GREAT PROBLEM OF THE XIX<sup>TH</sup> CENTURY.****VENTILATION  
WITHOUT DRAUGHT.**

The hitherto unsolved problem of "Ventilation Without Draught" is to be seen practically illustrated at FREDERICK HENRY SMITH'S Test Room, No. 68, 52 Queen Victoria Street, E.C., Patentee of the Automatic Siphonic Aspirator System of Ventilation. A personal inspection invited.

*Extract from the Annual Report of the "French Hospital and Dispensary," issued 29th January, 1885.*

We have also to return our best thanks to Mr. Smith, who undertook gratuitously to repaint one of our wards and to apply a new system of ventilation of his own invention, which was very successful.

*Letter from David Urquhart, Assistant Engineer to Colonel Sir Francis Bolton, C.E.*

F. H. SMITH, ESQ., 52 QUEEN VICTORIA STREET, E.C.

4 THE SANCTUARY, S.W., LONDON: NOVEMBER 22nd, 1884.

In reply to your inquiry, I have much pleasure in certifying that your system of ventilation as applied to the "Island Room" of the illuminated fountains at the Health Exhibition reduced the temperature during the displays from about 110 deg. to about 70 deg., and thus enabled the men to perform their duties without inconvenience.—Yours faithfully,

DAVID URQUHART.

*Extract from the TIMES of March 14, 1885, page 7.*

"VENTILATION WITHOUT DRAUGHT.—This desideratum appears to be accomplished by a syphonic system devised by Mr. Frederick H. Smith, at whose offices, 52 Queen Victoria Street, London, we recently inspected the arrangement. The air supply is conducted into the apartment from the external atmosphere by means of air ducts, which terminate in distributing passages at the floor level. The exit for the vitiated air is placed in the ceiling, and consists of two tubes, a large and a small one, running parallel to each other between the floor joists in the case of rooms having others over them. In the case of rooms on top floors, or those having the roof directly over the ceiling, the tubes are placed concentrically, but the action and results are the same. The larger of the two tubes carries off the vitiated air, while the smaller one forms an induction tube for cold air, its outer extremity being open to the atmosphere. These two tubes or conduits are so connected that the passage of the heated air through the larger tube induces a current of cold air through the smaller one in a continuous stream. The result is a rapid clearing away of all deleterious gases and products of combustion as they accumulate, and the preservation of a pure atmosphere at an equable temperature in the apartment. In a small room at Mr. Smith's offices in which five large gas-jets were burning, the atmosphere was apparently quite innocuous at the level of about 7 feet, the temperature being about 60 deg. Fahr. At a higher level, however, and especially near to the ceiling, the temperature was high and the air greatly vitiated. It was demonstrated that this vitiated air was being drawn off through the exit tube, which acted as a powerful sucker. After turning off the gas-burners, and upon the temperature of the room generally becoming lowered and equalised, a feeble upward action was still maintained in the upcast tube, but there was no down-draught whatever. The system has already been applied to a church and other buildings with acknowledged success."

**WIGAN.**

For Building Wing to the Royal Albert Edward Infirmary, Wigan. Messrs. T. WORTHINGTON & J. G. ELGOOD, Architects, Manchester.  
PRESTON, Wigan (accepted for builder's work).

**WINDERMERE.**

For Building Detached Residence, with Studio, Ellerthwaite Estate, Windermere. Mr. ROBERT WALKER, Architect, Windermere. Quantities by the Architect.

Martindale, walling and mason work.

Stables, joiner work.

Armstrong, plastering.

Bonney, plumbing.

Croft, painting, &c.

Total amount, £1,100.

**NOTES ON NOVELTIES.****The "Calda" Heater.**

Mr. G. SHREWSBURY, of Newgate Street, E.C., has just issued a new catalogue of the gas-baths, patent "Calda" water-heaters, gas-stoves, &c., of which he is the patentee and sole maker. The "Calda" or instantaneous water-heater is made in various sizes and styles, and will give a warm bath of 20 to 25 gallons in ten minutes; and a useful form of the apparatus is the "Liliputian Calda," which will give three pints of hot water per minute, and is designed for lavatories, butlers' pantries, nurseries, sitz-baths, &c. In the "Calda" heaters the water has no contact with the gas, and thus is delivered pure when heated. Patent burners are also used, which swing out for convenience of lighting, &c. The outlet for the hot water is at the top of the "Calda," so that, being always full of water, no injury would ensue if the gas is lit before the water is turned on. The inside is of tinned copper, and so constructed that no loss of heat can take place. The list of articles begins with gas conservatory boilers and portable hot-water apparatus. These appear in various sizes, to

heat larger or smaller areas as may be required, and are suitable not only for conservatories, vineries, propagating-houses, &c., but for halls, shops, counting-houses, harness-rooms, schools, &c. The list also comprises a variety of baths for cold water and for hot water. They are fitted with patent gas and air burners, &c., which effect a great economy in consumption of gas, and give a hot bath in thirty minutes. These include the "Marvel" gas-bath, the "Excelsior," the oblong taper and the registered universal gas-baths, the semi-Roman bead-bath, &c., all these being made right or left handed. Gas cooking-stoves in numberless varieties, from sausage-cookers and grilling, roasting, boiling, and bread-toasting stoves to large stoves and restaurant cookers, and also combination stoves for cooking or heating purposes. Among the gas-heating stoves a numerous choice is afforded of every kind, as well as of ornamental descriptions. And among other useful articles are portable washing coppers and stoves for special purposes, such as laundry stoves, tailors' and hatters' stoves, &c. The prices are certainly noteworthy as being extremely moderate.

**Crystalline Glass.**

The samples of this glass that we have seen suggest that the crystalline glass can, with little trouble and with very small expense, be employed to serve useful purposes while producing exceedingly pleasing effects by way of decoration and ornament; and it is very handy where it is desirable to obstruct the vision without interfering with the perfect transmission of light. The CRYSTALLINE GLASS COMPANY, LIMITED, who are the sole manufacturers of the patent crystalline glass, are desirous of calling the attention of architects and builders, and of workers in stained and painted glass, and the public generally, to this novelty, by the use of which excellent effects can be produced in stained glass work for all purposes, ecclesiastical or domestic. By the process white, coloured and tinted glass of whatever description can be crystallized to any desired outline, leaving portions of the same sheet plain, and by gild-

ing or silvering crystalline glass an appearance of frosted gold or silver is given. This enriched crystalline glass may be used in the decoration of chimney-pieces, tiles, finger-plates, &c., and an endless variety of objects, and is specially adapted for the decoration of public buildings, restaurants, &c. As far as ornamental effect goes, nothing of its kind could look prettier by transmitted light.

**TRADE NOTES.**

AMONG the many works executed for use at Easter by Messrs. Jones & Willis, are a carved oak reredos for Kirkby Ravensworth Church, and an oak pulpit for the church at Magourney, Ireland. They have also in hand a memorial pulpit for Ballycastle Church, in memory of the late Dean of Eilpon.

HAVING completed their Suakim contracts, Messrs. Clark, Bunnett & Co. (Limited) have received further instructions from the War Office to erect iron storehouses at the Royal Army Clothing Depot, Pimlico. The Company have also orders to fix their hydraulic lifts for the London Tramway Company and the new Liberal Club, Birmingham.

MESSRS. KAYLL & Co., of Leeds, have obtained the contract for the glazing of the new Presbyterian church which the committee have decided to build in Harrogate. The architect is Mr. Newcomes, of Newcastle. They have also the order for the leaded lights for St. Mary's Church, at the Holme, Doncaster, the foundation-stone of which Sir Edmund Beckett, laid on the 12th ult. They are also glazing Blyth Church, at Retford, for Mr. Hodgson Fowler, architect.

ON Easter Day two stained-glass windows on the north and south sides of the chancel of the church of St. John the Divine, Brookland, were unveiled. The window on the north side represents two scenes from the Resurrection of Our Lord, and that on the south the commission to St. Peter and the Ascension. The windows have been executed by Messrs. Wailes & Strang, of Newcastle-on-Tyne.

**BELLMAN'S PATENT GULLY.**

*This Gully possesses the following advantages:—*

**Receives and disconnects one Rain-water Pipe and Three Waste Pipes.**

**Avoids all Splashing.**

**Ventilates the Pipes and Trap.**

**Forms Drain for Area or Surface.**

**Is easy of Access for Clearance.**

The ordinary P or S trap to be used in connection with Gully being in a separate piece, can be placed at any angle to meet the drain exactly, thus insuring a perfect joint, the Gully being fixed at right angles. This is a great advantage over other arrangements made with the trap in one piece.

*The Holes for Rain-water Pipes are made both Circular and Square and of various sizes.*

DESCRIPTIVE CIRCULAR ON APPLICATION.

**THIS GULLY IS HIGHLY RECOMMENDED by Authorities on Sanitary Matters.**

**PRICE AT WORKS, 8/6 EACH.**

Also SINGLE GULLIES, for Sink Wastes only, price 3/9 each.

**BELLMAN & IVEY, 95 Wigmore St., London, W.**

**DAMP WALLS.**

**BLUNDELL'S PETRIFYING LIQUID**

Is a preparation for interior use, for the cure of **DAMP WALLS**. It is made in two colours, White and Red. It is applied with a brush as easily as ordinary paint, and dries hard in a few hours with a glazed surface. The many uses of such an article are obvious. As an economical substitute for White and Red Glazed Bricks, for interior walls, it is most efficient. Applied over brick, cement, iron, or wood, for the walls of passages, kitchens, schoolrooms, hospitals, and charitable institutions, where **CLEANLINESS** is indispensable, it will be found invaluable, as the smooth enamelled surface offers but little hold for dirt, &c., and can be washed when necessary. Used over walls before papering, it prevents discolouration, and offers a surface to which the paper will adhere firmly. Economical in cost, simple in application, and efficient in use. The proprietors recommend it with full confidence. To be obtained of the leading Paint Colour, and Varnish Dealers.

**BLUNDELL, SPENCE & COMPANY, LIMITED,**

Colour, Paint, and Varnish Makers, Oil Boilers and Refiners,

**HULL, and ANCHOR WHARF, 9 UPPER THAMES STREET, LONDON, E.C.**

**ELECTRIC HOUSE BELLS.**

For Mansions, Banks, Hotels, Houses, Offices, Yachts, House to Stable, and all purposes.

LIGHTNING CONDUCTORS. FIRE TELEGRAPHS. SPEAKING TUBES.

**FRANCIS & CO.,**

Eagle Telegraph Works, Hatton Garden, London, E.C.

Best Goods only.  
The Trade supplied.

**ELECTRIC HOUSE BELLS.**

FIRST PRIZE MEDALS from all the leading Exhibitions at Home and Abroad.

# "THE PEDESTAL VASE," JENNINGS' IMPROVED W.C. APPARATUS

(Combination Urinal and Slop Sink).

Registered No. 16,300.

A PORCELAIN VASE set on a tiled or mosaic floor, within walls or a dado of glazed tiles. The usual wood framing, forming a storehouse for the retention and accumulation of damp, dirt, and disease germs, with the joints, crevices, and imperfections in work which the closet enclosure so often conceals, is entirely abolished. The seat is hinged, permitting free access for use as a slop sink or urinal, and for cleansing, so that the entire apparatus and space can be freely washed down. For this latter purpose the floor should be slightly sunk, and laid to fall to a grating, with waste carried through the external wall, and terminating in a copper flap valve to prevent draught.

The suggestions as regards wall linings and floor, may, of course, be modified as best adapted to the building in which the closets are used; and in the consideration of such details, alternative schemes will readily present themselves.

At the recent **HEALTH EXHIBITION** (South Kensington, 1884), amongst a series of official tests, under the supervision of Baldwin Latham, Esq., C.E., and the Jury No. 9, Class XXIII., and successfully withstood by this closet, the following may be cited in evidence of its efficient action. Being fixed in position shown in illustration, with "**JENNINGS' PATENT SINGLE FLUSH WASTE-PREVENTING SYPHON CISTERN**" 5 feet over, with  $1\frac{1}{2}$  inch down pipe, ten apples (averaging  $1\frac{1}{2}$  inch diameter) and a flat sponge about  $4\frac{1}{2}$  inch diameter were thrown into the basin. The water, as well as the whole of the exposed or dry surface, was first blackened with plumber's "1 ge," and the sides covered by four pieces of thin sanitary paper, which adhered closely to the soiled surface. The handle of the cistern was then pulled, and the two-gallon flush liberated. After seven seconds (the time occupied by the discharge), a receiver placed under the trap outlet was removed, containing in the blackened water the ten apples, the sponge, and the four pieces of paper, no traces of the soil remaining visible upon any part of the apparatus.

**GOLD MEDAL AWARDED.**

THESE CLOSETS are already in use in Hospitals, Banks, Hotels, Offices, Private Residences, &c., with most satisfactory results, and, fixed in the manner described, in appearance and action leave nothing to be desired. By the novel arrangement of the supply to Basin, as shown in the sectional sketch annexed, the whole surface is well flushed and cleansed, whilst the bottom of Basin and Trap are thoroughly scoured by a concentrated rush of water which insures the instantaneous removal of the contents, thus overcoming the inherent defects in the many imitations recently produced of "**JENNINGS' MONKEY-CLOSET**" (the original form of wash-out watercloset), which was invented and patented by G. J. in 1852.

**GEORGE JENNINGS,**  
SANITARY ENGINEER, STANGATE LONDON,  
A VISIT TO THE SHOWROOMS IS RESPECTFULLY REQUESTED. S.E.

**VOLUME XXXII. OF THE ARCHITECT.**

# The Architect.

## THE WEEK.

THE Archbishop of CANTERBURY has given his decision on the dispute respecting the restoration of the Peterborough tower. His Grace recommends the establishment of an executive committee composed of the Dean and four canons, with four committeemen nominated by them, and eight members of the present Restoration Committee, and that it should, upon its formation, immediately resume the question and determine the course to be pursued. He gives a judgment which in the meantime will stand as the decision of the arbitrator, and says he has had to choose between the replacement of the pointed arches of A.D. 1380, with provision for a future superstructure, and the substitution of Norman arches for Pointed, with a Norman storey above, working from relics which have been found in the course of the restoration of the cathedral, and which probably formed an arcade before 1380. After recounting at length the advantages and disadvantages of each proposal, His Grace recommends that the first plan be adhered to, and that the recovered fragments of the Norman tower be fitted together and retained to illustrate the antiquities of the cathedral.

A LETTER has appeared in the *Times* from a Moham-  
medan newly arrived in England, expressing surprise that, although London possesses so many Mohammedans, there is not a single mosque in the city. He believes there are a sufficient number of followers of the Prophet in England to allow of a fund being raised to erect and furnish the building. If the suggestion should be carried out, it will give an opportunity for a class of work that will be picturesque and novel.

THE saw-mill case to which we referred last week has been decided. It will be remembered that damages amounting to over 80,000*l.* were claimed by Messrs. SOMMERVILLE from the Glasgow and South-Western Railway Company. After a trial which lasted for six days, the award of the jury was as follows:—For building, machinery, &c., 14,572*l.* 16*s.* 3*d.*; for land claim, 25,987*l.* 7*s.* 4*d.*; 10 per cent. compulsory allowance, 2,598*l.* 14*s.* 9*d.*; for trade claim, 9,499*l.* 8*s.* 3*d.*; total award, 52,658*l.* 6*s.* 7*d.* If it be true that the railway company had offered 55,000*l.* in settlement of the claim, the plaintiffs cannot congratulate themselves on the result.

THE exhibition of the works of EUGÈNE DELACROIX was closed on Wednesday last. Up to Sunday 60,000 frs. had been received. As the expenses should not be excessive, the results will go far towards the cost of the erection of the statue of the painter. The committee have shown good sense in permitting many art students and teachers to have free admission to the galleries.

THE Salon Jury for Painting have concluded their labours in judging of the works sent in for admission. The works sent in numbered 5,614, and out of those 2,500 have been accepted for admission. It has been customary to allow friends of the painters to visit the galleries on varnishing-day. This year there will be a restriction. Anyone who is desirous to see that part of the preparation for the annual show can do so by paying 10 frs., a sum which will be handed over for the benefit of the soldiers wounded at Tonquin.

THE final report of the Cathedral Commissioners is a document which demands the attention of every one who wishes to see the cathedral buildings preserved in the condition that corresponds with their historical and architectural importance. Lord HAMPTON's return gives the large expenditure since 1840, amounting in some cases to over 100,000*l.* But it is to be feared that deans and chapters can no longer be equally liberal. The Commissioners say that any fresh legislation should deal generously with regard to the depressed pecuniary condition of the cathedrals, and which is due to no fault of the cathedral

bodies. On the subject of the repair and preservation of fabrics, the Commissioners think that if the fabrics of the cathedrals are to be permanently secured the question of an increase of caputal resources from property in the hands of the Ecclesiastical Commissioners must be fairly dealt with, as on that property the cathedrals have a claim. A feeling is indicated that in recent arrangements with the Ecclesiastical Commissioners this matter has not received adequate consideration.

It is surprising that Devon, which is so important a county, does not appear to have ever possessed armorial bearings or a common seal. Some of the boroughs, such as Exeter and Plymouth, have that distinction, but not the county. The clerks of the peace generally use their own crest or monogram on the official seals. Mr. HAMILTON, who has brought this curious subject before the quarter sessions, has carried resolutions to the following effect:—“That it be referred to the County Buildings Committee to inquire and report (1) whether the county of Devon has ever possessed armorial bearings or any common seal of that nature; (2) whether it is desirable that such armorial bearings should be revived or assumed by the county; (3) if so, what steps should be taken to attain that object.”

At the meeting of the Wolverhampton Town Council on Monday, it was reported that the estimated receipts of the School of Art for one year were 500*l.*, making no allowance for increase of income from the larger number of scholars that ought to be expected in the new building, which had been presented to the town by Mr. PHILIP HORSMAN. The expenses were also estimated at 500*l.* It was recommended that a head-master should be appointed at a salary of 250*l.* a year. An assistant-master will be required, at a salary of 70*l.* a year.

THE report on the quality of the water supplied by the metropolitan water companies during March is a favourable one. The whole of the samples are declared to be perfectly clear, bright, and well filtered. Considering the condition of the river during the month, and the additional care needful to effect good filtration, it is surprising that not one of the 188 samples examined by the analysts contained so much as a trace of suspended matter.

THE collection of engravings and etchings belonging to Mr. W. B. SCOTT, and which will be sold at SOTHEBY'S during the whole of next week, is interesting not only from the rarity but from the value of the subjects. The engravings go back from the present time to the infancy of the art, and several have not been described by BARTSCH or other authorities. One print of a female figure in a religious habit appears first to have been made on the plate (probably some soft metal) by a series of punctures or indentures, which must have been made from the back of the plate as they indented on the paper. That they were in the plate originally, and not made in the paper afterwards, is evident from the accumulation of the ink in many of them. A collection which has been brought together with so much patience and skill deserves to be purchased as a whole for one of the provincial museums.

THE promoters of the Manchester Ship Canal were found to have gained a part of their case on Wednesday. The Committee of the House of Lords, before whom the Bill has been brought, decided to take the engineering evidence by itself; and, if it failed, then to declare that the commercial evidence was unnecessary. The case has occupied a great many days. The counsel for the Bill argued that the objections to the scheme involved a mass of absurdities and contradictions, and that it might be proved as much from the opposing witnesses as from those of the promoters. It was not likely men such as Mr. ABERNETHY and Mr. LEADER WILLIAMS, after all that had happened since the scheme was projected, had gone hopelessly wrong, and he asked the Committee to come to the conclusion that they did not believe in the engineering objections of the opponents. The Committee decided to allow the Bill to proceed, and this decision has been held to mean that ultimately the preamble will be declared proved.

## THE NEW OFFICES IN PARLIAMENT.

THE discussion in the House of Commons on the vote of 10,000*l.* for the new Admiralty and War Offices afforded another example of the absurdity of the Parliamentary mode of deciding questions of taste. All sorts of side issues were introduced, including wars and rumours of wars, iron ships, the administration of NAPOLEON III., the fortifications of Portsmouth, as well as the differences between Classic and Gothic. It is needless to say that the defects of the Home and Colonial Offices were once more proclaimed with the customary amount of exaggeration.

That there are grounds for objections against the designs may be taken for granted, although they were not mentioned in the late discussion. The authors have been over-anxious to produce effects, and their employment of sculpture on every point of vantage is suggestive of a practice that is common in modern competitive work. If successful designs were always carried out in their entirety the sculptors would have no reason to complain of want of commissions; but, as a matter of fact, the figures are as remote from realisation as the blue skies which are seen if the perspectives are coloured. When Mr. BERESFORD-HOPE and Mr. GREGORY objected to the overloading of ornament that is apparent, they were paying a compliment to the designs as competition drawings. The architect is lucky who is able to allure criticism from his architecture to his sculpture. Figures are invaluable for taking objections on their shoulders. They are as useful as the oddly-clipped poodle which the Athenian statesman kept for the purpose of diverting attention from defects in himself.

It is remarkable that none of the opponents of the proposed buildings were able to bring forward objections that were valid. The expense of producing the lithographs distributed among the members appears to have been thrown away, for no one seems to have studied them with care. The reasons that were given for and against the new building were not derived from architectural study. Mr. BERESFORD-HOPE, who led the attack, suggested that the carcass of the building and the distribution of the rooms should be accepted, but that a new mode of clothing the carcass should be adopted. This strange proposition may be a sarcasm on Renaissance building, but it can hardly have been offered seriously. When nothing better is to be derived from the wisdom of Parliament, it was not worth while to postpone the arrangements to give the House an opportunity of examining the matured designs.

No one will be surprised to find that the credit for any improvement which is found in the new designs is claimed by the Office of Works. Mr. AYRTON, we remember, posed as the corrector of the designs for the Law Courts, and the grumbling which is likely to endure while the building lasts will be a testimony to the value of his interference. Let us see what is the value of the official inspirations. Mr. SHAW-LEFEVRE said that Messrs. LEEMING had on his suggestion thrown back the front of the building 35 feet, had enlarged the great court from 80 feet to 95 feet, had completely modified the Whitehall front, and had altered the position of the campanile. The second alteration is probably the one that is of most consequence. The abstraction of a piece of ground 35 feet in width, in so valuable a position, for the sake of effect would have appeared a fatal step to a designer, and if so much liberality were contemplated it should have been announced. The competitors understood that the space was to be utilised to the utmost, for if a rigid economy had not been paramount, why was not the whole frontage between Spring Gardens and the Horse Guards made available? As a rule, the setting back of a building is an advantage, but it will not be without drawbacks in this case. The houses in Whitehall will appear more in the way, and the new offices will not correspond with the remaining Government Offices or with the Banqueting House, in all of which the ordinary conditions of street architecture are frankly accepted. The benefit gained by removal of the campanile is likewise questionable. Campaniles have been supposed to be places in which bells were to be hung, and the use of bells or the receptacles for them is not apparent in connection with the army and navy. In the original design the tower marked the end of the building. It was like a long note of admiration at the close of a sentence; now it is like the note trans-

posed to the middle of a clause, and its use becomes still more mysterious. The self-laudation with which the alterations have been introduced does not appear to be as well earned as may be supposed. But it is now evident that there is a desire to make the new building more obtrusive than any other Government office, just as if it were a memorial of the Administration. Many of the competitors will regret that they had not worked out the conditions in this spirit, while the more credit is to be given to the interpreters who at such a distance could read the signs of the times aright.

The example of Parliament is sometimes followed, and it may be well to warn the public that the long period over which the building works are to be spread is not conducive to economy. It may appear a wise arrangement to put fractions of the cost into a dozen budgets; but what builder's calculations would be made on such a basis without a large margin for risk? If it be necessary to have one part of the building completed before another, that could be done without much loss being incurred. But if economy is to be considered, the Government proposals will have to be greatly altered.

## THE LIVERPOOL ARCHITECTURAL SOCIETY.

THE good city of Liverpool is supposed to be an energetic place, but somehow the local Architectural Society is disposed to take life easily, and they appear to be well seconded in that respect by their printers. We have received this week a parcel of reports of the proceedings; they all bear the date 1884 on the cover, but the meetings that are recorded began as far back as 1882. Amidst the feverish efforts that are made to have one part of a speech read and discussed by the public before the second part is uttered, the Liverpool system of reporting is reposeful by its contrast. There must be firm faith in the value of the papers that are printed so long after they have been written. Let us, however, be guided by the proverb, Better late than never, and consider what has been vouchsafed to us.

According to the last report the Society possessed 141 members, and the expenditure being 140*l.* 15*s.* 9*d.*, was about a pound a-head. The year closed with a balance in hand of 219*l.* 7*s.* 4*d.*, and it is therefore plain that amidst the depression the Society is solvent.

At one period the Liverpool architects affected the theoretical style of essay, and were fond of discussing those interesting problems which appear to be beyond solution: "Old times are changed, old manners gone," and in Liverpool, as elsewhere, the so-called practical questions have gained the ascendancy. We seem to hear an echo of a long past age in reading Mr. BOULT's "Architectural Revivalism," and what he says about philosophy and theology, the Sanhedrim, EMERSON, and the Classical divinities. How strange the paper seems in company with those on "A Novel Brewery," "Building Regulations," "Our Villas," "Compensations," "The Law of Light and Air," "Specifications and Quantities," "Constructive Ironwork," "Supervision of Buildings," and the like! Is the change for the better? We cannot answer in the affirmative. There is a strong desire for knowledge at the present day in architectural societies, but is it not in many cases suggestive of imperfect training, and of an eagerness to obtain the results of experience without cost or trouble? At one time the societies were modelled on the plan of the old academies, and the reader of a paper expected to receive as much as he gave. Sometimes he met his superiors, always he found peers, in front of him; but now for a paper to be successful it must be of a didactic kind, and the more elementary the better. Is it surprising that diplomacy has to be exercised in London and the provinces for the purpose of inducing men to read papers under the new conditions, and that discussion is becoming every week more difficult?

Everyone who knows anything of Lancashire is aware that Liverpool hardly esteems its architects as well as they deserve; perhaps we ought to say that the citizens care little for Lancashire architects, and this constitutes one of the points of difference between the city which imports and the city which manufactures cotton. The President of the

Society, Mr. PARSLÖW, testifies to so strange a prejudice, when he says that he heard a distinguished town councillor exclaim, "Architects in Liverpool! Why, there are no architects in Liverpool." Under the circumstances it shows rather exalted generosity to find the President expressing the feelings of the members in saying, "We are highly pleased to have in our midst buildings by the privileged architects of London and elsewhere: when an architect from outside Liverpool obtains by competition a commission to erect public buildings in our city we congratulate and welcome him." It is difficult to see how brotherly love can further go, unless it should become inspired by the remarkable liquor which is described in one of the papers under the name of "Panacea," or the fermented buttermilk which the President admires.

Architectural education has afforded so much discussion from time immemorial that it may be compared to one of those admirable stags which are kept for London sportsmen, and are always ready to start. Mr. BARE, who read a paper on the subject, appears to have been in earnest, for he ascribes the failure of the Society's classes to the architects, who should have supported them, and not to the students. Mr. BARE even proposes that the printing of the transactions should be discontinued, and the money applied to the classes and prizes. The suggestion is deserving of consideration outside Liverpool, for costly volumes of which only portions are read, and by the authors of the respective portions, are an anomaly in times like the present. Transactions used to suggest something profound, and a row of quarto volumes formed an imposing kind of decoration for a bookcase; but when it is discovered that they find their way to waste-paper shops, there to keep company with Blue-books, the charm has ceased. One-half of the expenses of the Liverpool Society arises from the printing of essays. Surely there are other things, as deserving of encouragement as literary composition, which are neglected.

The paper on the building regulations in Liverpool, by Mr. GOLDSTRAW, suggests the discrepancies which exist in England, and for which the by-laws of the Local Government Board were supposed to furnish a remedy. Strange as it may appear, an Act of Parliament which, with the grim humour of legal draughtsmen, was called a Sanitary Act, empowered the construction of streets of not less than 3 feet in width unless the length exceeded 300 feet, when a width of 4 feet was graciously permitted. There was a likelihood that the arrangement might lead to inconvenience between the occupants of opposite dwellings, when a police magistrate discovered in 1872 that no projections were illegal which did not interfere with the traffic on the streets. If that worthy magistrate could be transferred to a metropolitan bench, and retained his faculty of interpreting prohibitive clauses in an artistic sense, there would be a hope for London architecture; but stupid people who had no eye for the picturesque, and desired to have a 3 feet clear space from ground to cornice, went to the expense of a special Act to regulate projections in Liverpool. Apparently 30 inches is now the limit.

An account is given by Mr. JOYNSON of villas which have been erected on the Clifton Park Estate, Liscard. They are set back 45 feet from the road, and evidently the auctioneer's favourite adjective "commodious" can be applied to them. The dining-room measures 20 feet by 16 feet, and, with the morning-room, 20 feet by 31 feet; the hall is 15 feet by 10 feet, the drawing-room 20 feet by 16 feet, and the kitchen 15 feet by 14 feet. Each pair stands upon 1,500 square yards of land, and for building with red brick fronts, backs and interior walls of grey bricks, Stourton stone dressings, and pitch pine in timber work, the cost was 1,800*l.* a pair, which appears to be moderate, but we find no illustrations to suggest the character of the villas. There is a reference in the paper to some concrete villas at Edgbaston, designed by Mr. EDGE, where the outer walls are 14 inches and the interior walls 9 inches thick. It was found that the cost was somewhat less than half the cost of ordinary brickwork.

Contracts in general, and the relation of builders, surveyors, and architects to building owners are suggested by a question (evidently referring to some local case), which was put by the President in one of his addresses. Supposing that in the quantities for the erection of a building costing 11,000*l.*, work to the value of 1,000*l.* was omitted,

who is to pay for it? The answer is the building owner, and looked at in one way that is the inevitable answer. But if, as so generally occurs, contingencies become a factor in estimating, it is difficult to say what should come under that head. To our minds, it seems strange that half a dozen or more builders could examine a set of plans for a building, unless its character or the conditions were exceptional, and be satisfied with quantities that were short to the extent of 10 per cent. The simplest cubing ought to discover the error. We can hardly suppose the case to be imaginary; and to learn that architects, surveyors, builders, and their clerks can be all alike blind when an error does not come home to them, must compel the Liverpool people to conclude that the distinguished town councillor had reason on his side when he said there were no architects in the city. Omissions to the extent of 1 per cent. are bad enough to come unexpectedly on a client when cotton is dull, but 1,000*l.* in a job of 10,000*l.*, and no consolation from the President of the Architectural Society, would be enough to make a Liverpool merchant lose his equanimity. We venture to doubt whether the panacea and the fermented buttermilk combined would form a nepenthe sufficiently overpowering to bring oblivion of the wrong. It is to be hoped that Sir EDMUND BECKETT may not alight on the address, which affords a colourable excuse for letters to the *Times* on architects' neglect of their clients' interests.

Architects, as a rule, hesitate about allowing their designs to be dissected for the benefit of others. The self-sacrifice of Mr. HORNBLLOWER in handing over drawings of a pier in wrought-iron to form a subject for Mr. GUTHRIE'S scalpel was a commendable act. The operation suggests that the factor of safety had not been exceeded. "The building then has passed the ordeal of analysis," says Mr. GUTHRIE, "and shows that the architect has judged the proportions admirably if he did not calculate them. I should not in any case recommend an architect to rely entirely upon judgment in any building of importance." And he goes on to point out how a better architectural result might have been insured if more economy had been exercised. The strength of the lantern and spire, it appears, is very far in excess of the part beneath, which has to sustain the brunt of the battle. "If my fees for analysis," says Mr. GUTHRIE, "were half the value of the superfluous metal, I should have three or four times more than enough to pay me for my trouble, and the architect would have so much more money to spend in further beautification." This is advice which should be remembered by architects, and when it is considered that the aid of experts is often obtainable without expense, there is no excuse for weighting a structure with superfluous plates and bars.

The difficult question of official supervision of buildings was again brought up in the paper by Mr. ELLICE CLARK. The author said that he had been in communication with one hundred and seventy local authorities in Lancashire and Cheshire, and his conclusion was that, while there is a similarity between their regulations, "each and every one of them bears the stamp of individuality." The minimum thickness of a wall in Oldham has to be 9 inches, in Manchester 4½ inches will suffice. It is found that the elaborate model by-laws are not an unmixed blessing. The details are supposed to be evident to the humblest capacity, supposing any one connected with the administration of local government dare be described as endowed in that way, and consequently they give rise to jobbery. In one case, where cottage building is carried out at a rapid rate, the executive officer is a retired master butcher, who is paid 150*l.* for amusing himself as an amateur with building. Mr. ELLICE CLARK, as an official, complains of the hesitation which is shown in depositing plans with the authorities. He ridicules the idea that the drawings can be used for other purposes, when it is so easy to obtain copies of drawings of all kinds in the building journals from week to week, and suggests that a good deal of professional work would be available if the documents required by local authorities were prepared by architects. Speaking from what he knows has occurred in his own district, Mr. ELLICE CLARK says that "during the past seven years upwards of 2,000,000*l.* have been expended in Hove in the erection of 2,500 houses; of these not one per cent. has been designed by architects." This is a startling statement, and is enough to excite grave reflections as to the state of professional organisa-

tion. What takes place in Hove is repeated all over the country.

The selection of the site for the proposed cathedral was discussed during a couple of meetings, and the difficulty of the case was apparent from the number of the suggestions. There was no voting, and consequently it is impossible to say which site secured most supporters. It will be evident from what we have said that the directors of the Liverpool Society contrive to have subjects of a debatable kind brought before the meetings, and if the Society is not flourishing they at least are not to be held accountable.

### XAVIER SIGALON.\*

IT would have been well if some of the works of XAVIER SIGALON had been exhibited in connection with those by EUGÈNE DELACROIX, which have been lately seen in the Ecole des Beaux-Arts, Paris. For SIGALON was earlier than DELACROIX in rebelling against the cold and Classic conventionalism which was supreme in France about sixty years ago. It is also remarkable that, like DELACROIX, he was a pupil of the Baron GUERIN, one of the ultra-Classics.

SIGALON was born at Uzès, fifteen miles from Nîmes, in the South of France, towards the end of 1788. He was taught painting by an artist named MONROSE, who had set up an atelier in Nîmes, but was not of much value as a painter. He had been a pupil of DAVID, and it is quite possible that in young SIGALON'S mind his master's deficiencies were taken as marks of the Classic school in general. SIGALON obtained commissions for pictures which were to be hung in local churches, but he felt that he was adapted for work of a different kind.

He came, therefore, to Paris when he was about twenty-nine, an age which might be considered too advanced for entry into a Paris studio; but French artists resemble the great Italian in always learning. GUERIN was then considered to be a great man, and to him SIGALON went. But they did not agree, and at the end of six months the pupil left. He found that his best teachers were the pictures in the galleries of the Louvre.

In 1822 he exhibited the *Young Courtesan*, which was at once purchased by LOUIS XVIII. for 2,000 frs. It was first placed in the Luxembourg, and afterwards removed to the Louvre. It was followed by works in various styles. The *Deliverance of St. Peter from Prison* was executed for the village church of Rôbiac. His *Locusta experimenting on a Slave with the Poison intended for Britannicus* obtained the gold medal in the Salon of 1824. It is a picture in which the terror of the scene is not veiled, and the extreme realism might be ascribed to defiance of the canons which then prevailed rather than to any other cause. The work is now in the museum of Nîmes. The *Massacre of the Princes of the Family of David by Athalie*, which is the subject of our illustration, is in the museum at Nantes. A *Baptism of Christ* was painted for the cathedral of Nîmes. The *Vision of St. Jerome*, which is in the Louvre, was commissioned by the State in 1825 at 4,000 frs.; but, although dated 1829, it was not exhibited until 1831. A *Crucifixion* is in the village of Issingeaux. The two last-named works were considered to be of so high a character that the painter's name was enrolled in the Legion of Honour.

But the war between the Romantic and Classic schools was then raging, and, although there were more enthusiasts for the former, picture-buyers were opposed to new-fangled notions. DELACROIX was able to subsist if he had never sold a picture. SIGALON, on the contrary, was compelled to depend on his pencil for a living, and, when he found that commissions were not forthcoming, he threw up historical painting in despair, and, returning to Nîmes, began life anew as a provincial portrait-painter. In spite of all his honours and successes, he left Paris poorer than when he entered the city. He was not destined to remain long in the South. ADOLPHE THIERS, who had once been a newspaper critic of picture galleries, held the Romantics in esteem, and as a Minister of State he wished to befriend them. The little man was inspired with a passion for grandiose works, and was anxious to obtain a full-size copy of MICHEL ANGELO'S *Last Judgment*.

\* See Illustration.

for the Ecole des Beaux-Arts. He believed that the most capable painter in all France to undertake the task was XAVIER SIGALON, and the selection is a testimony to his insight and judgment. Accordingly the artist was summoned from Nîmes, and from the Government accepted a commission that was congenial to him. The price offered must not be judged by the modern English standard. SIGALON was to be paid 58,000 frs. for the colossal work, with an indemnity of 20,000 frs., and an annuity of 3,000 frs. He set out for Rome in July 1833, and commenced painting in the Sistine Chapel without delay. After about three years' labour SIGALON completed his copy. It was exhibited in the Baths of Diocletian, and was visited by GREGORY XVI. and the College of Cardinals. The Pope, it is said, was so delighted that he shook hands with the artist, a kind of honour that is supposed to be reserved for princes. SIGALON brought his large picture to Paris in February 1837. It was fixed in that part of the school which had formed the chapel of the Augustinian friars. THACKERAY, who saw it soon afterwards, testifies to its merit. "In the same school of the Beaux-Arts where," he says, "are to be found such a number of pale imitations of the antique, Monsieur THIERS (and he ought to be thanked for it) has caused to be placed a full-sized copy of the *Last Judgment* by MICHEL ANGELO. There is the sublime, if you please—a new sublime—an original sublime—quite as sublime as the Greek sublime." The work was considered so satisfactory that commissions for copies of the pendentives of the Sistine Chapel were given to SIGALON. He returned to Rome, but was not able to complete the work, for the painter unhappily succumbed to an attack of cholera on August 18, 1837. His death was regretted, for it was beginning to be considered that SIGALON, from his power of draughtsmanship, would supplant INGRES, while as a colourist he was superior.

The picture which we illustrate is taken from RACINE'S tragedy of "Athalie," the last work of the French poet, and one which, according to the German SCHLEGEL, was enough to gain a reputation. It has been lately revived on the stage of the Odéon; but let no one imagine that a scene corresponding with the picture is there performed. So much excitement would not be in keeping with the classical tragedy of France. The painting depicts the description given in the first act by one of the characters, JOSABET, the wife of the high-priest, of the terrible vengeance taken by ATHALIE, the widow of JORAM, when she commanded the Judean princes to be slaughtered. It corresponds with the tenth verse of the twenty-second chapter of the second book of the Chronicles:—"But when ATHALIAH the mother of AHAZIAH saw that her son was dead, she arose and destroyed all the seed royal of the House of Judah." JOASH, her grandson, was however rescued and concealed in the temple. After ATHALIAH had reigned for seven years, she was overcome by the strategy of the high-priest, and was slain at the horse gate. JOASH then ascended the throne, and was king in Jerusalem during forty years.

The Scriptural description of the massacre is very brief. RACINE, who was reverential in his treatment of the subject, goes into rather more detail. "The terrible scene," says JOSABET, "is continually revived and appals me. The place was filled with the princes. The implacable ATHALIE stood with a dagger in her hand, and urged her barbarous soldiers to the carnage. Suddenly I perceived JOASH, who was left for dead. I can still see his faithful nurse, who threw herself before the executioners and tried to save the infant whom I rescued." It is this scene which inspired the painter. The school of the Romantics sought after scenes of commotion, as was perhaps not unnatural at a time when the prosperous bourgeoisie in art and literature were esteeming themselves as the highest type of men, and the events of the Revolution were supposed to be in bad taste. SIGALON, who was inspired by the spirit of the new revolution, accordingly produced a picture which, as representative of RACINE, is one of the most remarkable productions of that time. There was audacity in compelling one of the gods of the Classics to yield a subject for their enemies, and in giving so passionate an interpretation to a tragedy that is like sculpture in its coldness. The picture is far more suggestive of a scene from MARLOWE or an early Elizabethan dramatist. As a design, it might at first sight be taken for one by DELACROIX, and on this account it

suggests the question whether SIGALON had not been one of the sources of inspiration for the chief of the Romanticists. The arrangement of the figures is admirable. By leaving so large a space around ATHALIE, the queen, who appears almost like a tigress, becomes the most important figure. The poet's lines are freely interpreted, and not merely infant princes, but men and women are introduced as the victims of the enemy of the House of Judah. The contrast between the negro mercenaries and the fair princesses, can only be rendered by means of colour. On the right we see the rescue of JOASH, and the affrighted JOSABET is reminiscent of a figure in MARC ANTONIO's *Massacre of the Innocents*, which RAPHAEL designed.

There are critics who will say that M. SIROUY's version is better than the original. This artist very often sacrifices himself out of reverence for other painters, and forsakes his own easel in order that he may translate a picture he admires into black and white. Few etchings or engravings will bear comparison with the chalk drawings which M. SIROUY has produced after artists so unlike as MULREADY, HAMON, PROUDHON, &c., and he is unique as an interpreter of SIGALON and DELACROIX.

### THE VATICAN MANUSCRIPTS.

THE catalogue of the manuscripts in the Vatican Library is at last nearly completed. Proofs of the two first volumes have been presented to the Pope by a commission attached to the library, who have worked under the direction of Cardinal Pitra. The burden of the preparation has been borne by Père de Rossi and the two Scottish Jesuits, the Fathers Stevenson. The praise given by the Pope to the volumes can accordingly be claimed by them as their meed.

It may appear strange to those who have had little acquaintance with work of the kind, that the catalogue should need so long a time for preparation. But experts can quite understand the causes of the delay. The Vatican Library is not much behind the other great libraries in Europe in the production of its catalogue. The classified catalogue of the French manuscripts in the Paris Library, which was commenced in 1739, was discontinued after the fourth volume in 1744, and has been since in abeyance. The catalogues of the Imperial libraries in Germany and Austria are little more than simple tables with names and dates, giving no clue to the contents which a perfect catalogue should do. Although a large and zealous staff is employed in London, we are far from possessing a complete set of abstracts of the documents in the Record Office in Fetter Lane. Elsewhere the manuscripts are mainly local, but in the Vatican they relate to the world, and the labour of abstracting becomes correspondingly difficult.

It is remarkable that an attempt to classify the archives of the Church was commenced as far back as A.D. 303, but the persecution of Diocletian was a sufficient reason for the discontinuance of the undertaking. The work was resumed when peace was restored by Constantine, and there is evidence that in the fifth century the scribes possessed offices in the Lateran, not, of course, in any part of the existing buildings, but in those attached to the Basilica of A.D. 324, which still confers the title of "Ornium urbis et orbis ecclesiarum mater et caput" on Galilei's and Borromini's church. As the Patriarchium of the Lateran was the first of Christian schools, it is believed that the manuscripts were then arranged in chronological order. In addition to the epistles of the popes and documents relating to the administration of the universal church, the Lateran Record Office possessed manuscripts of the works of the early Fathers, theologians and ecclesiastical historians, documents relating to the persecutions, copies of letters between popes and bishops, acts of councils, and the like. It was there that Gelasius, who continued the history of Eusebius, deposited his controversial works against Nestorius and Eutyches; there the African bishop Vigilius sent the versified version in Latin of the Acts of the Apostles, which had been made by the subdeacon Arator, who held office under Athalaric the king of the Ostrogoths, and to it Pope Gregory the Great bequeathed the Homilies, which were in course of delivery when the Lombards swooped down on Italy. The library was a storehouse for works which had to be copied for the churches

throughout the world as then known. In return, bishops and abbots sent manuscripts which were found in their districts. We know, for example, that Ælfridus, the master of the Venerable Bede, carried to the Lateran a copy of a work by St. Jerome, which is supposed to be the Amatine Codex now in the Laurentian Library of Florence. In course of time, the treasures grew to be too numerous for the halls. It was necessary to obtain a new library, and accordingly one was built near the Arch of Titus. But Rome was for many centuries liable to pillage, and a secret depository was constructed on Monte Soracte, which commands the whole Campagna. In pagan times the hill was considered to be under the protection of Apollo, and in the Middle Ages there was supposed to be a mystery about it. Subsequently the records were divided between the Vatican and Castle San Angelo. In spite of all the precautions the manuscripts could not be preserved in the vicissitudes of the Eternal City, and the historian must ever lament the loss of materials which would have explained what now seems obscure in the history of Europe from the fourth to the twelfth century.

Pope Innocent III., early in the thirteenth century, organised a system for the Papal archives which still is respected, and from that time until now the series of records may be said to be complete. When about one hundred years afterwards the seat of the popes was translated to Avignon, the records and other manuscripts were despatched to the French city. Many of the manuscripts of classic writers found their way afterwards to other libraries, and it was in vain that succeeding popes claimed them back. On the return of the popes to Rome the collections were reorganised. The enthusiasm of Nicholas V., as a bibliophile, about the middle of the fifteenth century, has extorted praise from even Gibbon, who says that "from the ruins of the Byzantine libraries, from the darkest monasteries of Germany and Britain, he collected the dusty manuscripts of the writers of antiquity, and wherever the original could not be removed, a faithful copy was transcribed and transmitted for his use." In eight years the Pope collected five thousand volumes—an enormous number, since all the copies had to be made by hand. The Royal Library of France at that time did not contain more than nine hundred volumes. Sixtus IV. (1471) divided the collections into two parts—one is what may be called the governmental section, which is now being summarised for the benefit of scholars; the second is the great library, containing in enclosed cases about 100,000 volumes of books and 24,000 manuscripts.

The Pope also had a catalogue prepared by Platina, which is still in existence. A second was prepared in 1533 by Sabeus. In the reign of Paul III. an alphabetical index of the Greek manuscripts was compiled by Michel Rosaita. Sixtus V., who was one of the most energetic of the popes, devoted great care to the Vatican Library. There is a tradition that he compelled Fontana, the architect, to have the building completed within a year, and only allowed another year for the elaborate decoration. In the catalogues he introduced the system of giving specimens of the writing, and we may, in consequence, consider that the plan of having facsimiles of painters' signatures in the catalogues of galleries is derived from the Vatican. An instalment of a general catalogue of Greek manuscripts was printed in 1575, of which there was a second edition at a later period. During the seventeenth century sundry inventories of the same kind were issued.

Simon Assemani, the prefect of the Vatican Library, issued three volumes relating to the Oriental books between 1756 and 1759. It was arranged that the catalogue should be continued, but the fire of 1768 destroyed the fourth volume, which was then being printed, and the notes which had been prepared for a continuation of the series. It was reserved for Cardinal Mai, the restorer and discoverer of palimpsests, to publish a supplement to Assemani's volumes, and a catalogue of the papyri.

The library has always been guarded with the utmost strictness, and there used to be a decree exhibited in one of the rooms by which any man—including the librarian and assistants—who removed a single volume without the permission in writing of the Pope was excommunicated. It should, however, be remembered that the manuscripts are the property of the human race; that nearly all of them are unique, and that during fifteen hundred years the library has been very often pillaged. The

French in 1795 were not unlike the French in 1527, when the Constable's name became a byword to frighten Roman children. It was one of the conditions of the treaty of Bologna, in 1796, that five hundred of the Vatican manuscripts were to be selected by Republican commissioners and removed to Paris, and with repeated exactions of a similar kind it is not inexcusable if the guardians of the library have hesitated in revealing the riches of the collection. But the history of the catalogue makes it plain that there has been likewise a desire from the first to let the treasures be known as far as was compatible with security.

### YORK ARCHITECTURAL ASSOCIATION.

A LECTURE on "The Decorated Period of Gothic Ornament" was delivered last week by Mr. G. W. Milburn, at the Victoria Hall, Goodramgate. The president, Mr. A. Pollard, occupied the chair. The lecturer described at length and with numerous sketches upon the black board how the thorn, vine, ivy, oak, and maple were introduced in the formation of capitals, crockets, diapers, spandrels, &c. At the conclusion, the President moved a vote of thanks to the lecturer, which was seconded by Mr. G. J. Monson, and carried. Mr. T. S. Worthington was elected an honorary member of the Association. The subject of the churches scheduled to be discussed or demolished was brought forward, but after a short discussion the question, for want of time, was postponed for future consideration.

### TESSERÆ.

#### Irish Churches.

GEORGE PETRIE, LL.D.

THE ancient Irish churches were almost invariably of small size, their greatest length rarely exceeding eighty feet, and being usually not more than sixty. One example only is known of a church of greater length, namely, the great church or cathedral of Armagh, which was originally erected of the length of 140 feet. In their general form they preserved very nearly that of the Roman basilica, but they never present the conched semicircular apsis at the east end, which is so usual a feature in the Roman churches, and the smaller churches were only simple oblong quadrangles. In the larger churches there is a second oblong of smaller dimensions extending to the east, and constituting the chancel or sanctuary, in which the altar was placed, and which is connected with the nave by a triumphal arch of semicircular form. These churches have rarely more than a single entrance, which is placed in the centre of the west end; and they are very imperfectly lighted by small windows splayed inwards, which do not appear to have been ever glazed. The chancel is always better lighted than the nave, and usually has two and sometimes three windows, of which one is always placed in the centre of the east wall, and another in the south wall; the windows in the nave are also usually placed in the south wall, and, excepting in large churches, rarely exceed two in number. The windows are sometimes triangular-headed, and more usually arched semicircularly, while the doorway, on the contrary, is almost universally covered by a horizontal lintel, consisting of a single stone. In all cases the sides of the doorways and windows incline like the doorways in the oldest remains of Cyclopean buildings, to which they bear a singularly striking resemblance. The doorways are most usually plain, and the windows still more rarely exhibit ornaments of any kind. The walls are always perpendicular, and generally formed of very large polygonal stones, carefully adjusted to each other, both on the inner and outer surfaces, while their interior is filled up with rubble and grouting. In the smaller churches the roofs were frequently formed of stone, but in the larger ones they were always of wood covered with shingles, straw, reed, and perhaps sometimes with lead.

#### Revival of Gothic.

REV. J. L. PETIT.

If we consider Gothic architecture to be one of the creations of a great national spirit, we shall at once account for the difficulty of reviving or reproducing it. The Gothic mind aims at constant progression; is not satisfied with retracing steps already trodden; it will not work readily in the trammels of imitation; it will rather attain new glories than strive to recover those that have passed away. We shall find that we have great architects as well as great masters in every other branch of art, if we do not suffer them to be cramped with needless restrictions. The old spirit is not dead in us; nay, it never was more active. Research scarcely owns a limit; science has unveiled marvels surpassing Northern mythology. A summary of its

triumphs would now be a puerile declamation of familiar facts, as it would formerly have been thought to be upon impossibilities and absurdities. The higher our aims the fairer is our prospect of success. In every other matter, while we honour and value the works of our predecessors, we make use of them as the groundwork of further acquisitions; we continually build upon them, instead of merely striving to attain to the same elevation. If a system becomes obsolete we do not attempt to revive it, unless we find upon examination that a recurrence to it will give a fairer start in the pursuit of truth. Our reverence for great names does not make us look at any perfection hitherto attained as a standard or limit, it rather urges us on to a higher perfection; we feel that all we have done in science and art is but an advance towards the truth, not a realisation of it. We may indeed start anew from a given point, if by so doing we may hope for new and great results; but this is a very different thing from taking as our standard of excellence some point that has already been reached. It is true that the desire for improvement and progress has often led to decline and fall. The movement may for a time be downwards, but not backwards; the Gothic mind cannot, in its very nature, be either stationary or retrograde. It is because we have Gothic blood in us that we cannot revive Gothic architecture.

#### Magnitude in Architecture.

EDMUND BURKE.

To the sublime in building greatness of dimension seems requisite, for on a few parts, and those small, the imagination cannot rise to any idea of infinity. No greatness in the manner can effectually compensate for the want of proper dimensions. There is no danger of drawing men into extravagant designs by this rule; it carries its own caution along with it. Because too great a length in buildings destroys the purpose of greatness, which it was intended to promote, the perspective will lessen it in height as it gains in length, and will bring it at last to a point, turning the whole figure into a sort of triangle, the poorest in its effect of almost any figure that can be presented to the eye. I have ever observed that colonnades and avenues of trees of a moderate length were without comparison far grander than when they were suffered to run to immense distances. A true artist should put a generous deceit on the spectators, and effect the noblest designs by easy methods. Designs that are vast only by their dimensions are always the sign of a common and low imagination. No work of art can be great but as it deceives; to be otherwise is the prerogative of nature only. A good eye will fix the medium betwixt an excessive length or height (for the same objection lies against both), and a short and broken quantity, and perhaps it might be ascertained to a tolerable degree of exactness.

#### Salviati's Mosaics.

PROFESSOR ARCHER.

In the Salviati process the drawing is made and coloured on paper, an adhesive surface is applied to it, and then the tesserae of comparatively thin glass are laid face downwards and adhere to the paper picture. The back is then covered with mastic cement, which is pressed so as to fill in the crevices between the tesserae, and to form a solid back; the whole of the back and sides are then enclosed in a zinc case, and the whole becomes a perfectly firm plate, as compact as a slab of marble, only two-thirds of an inch in thickness, instead of ten or twelve, as in the case of Roman and Russian mosaics, and weighing hundredweights instead of tons.

#### Photography and Art.

W. W. STORY.

One does not alone see with the eye, but with the mind and the soul, and nothing truly artistic can ever be produced mechanically. It is the transfusion of nature through the spirit of the artist which alone can give us a work of art. A mere photograph is very rarely and exceptionally a picture, but it is a most valuable basis for one, provided it be not followed too slavishly. The dead, soulless eye of the camera-obscura gives us only the corpse of what, when we look at it, is full of life and feeling. It repeats statistically, not artistically, the dead facts, with all their accidents of mould and stain and breakage, insisting upon them with always too strong an emphasis; it takes no heed of the difference between colour as colour and as light and dark, thus falsifying the true impression on the eye, giving, for instance, yellow as dark, while it really is positive and produces the effect of light, and restating blue, which is negative, as positive light; and it also takes no heed of planes of distance, representing all parts as upon one plane. Doubtless, despite these very essential defects, it is of great value and interest. It has nothing to do with sentiment, but simply to repeat facts—the husks and shells of things. *Tant pis* for the sentiment if it cannot get itself recorded—being intangible and invisible. Yet the truth of the photograph is always insisted.

on—at least it does not lie, we are told. Yet, despite of all its pretensions, it does lie. Its planes are false; its colours falsely reported; its chiaro-oscuro wrong. Besides, there are two kinds of truth: one truth to the imagination, which may be given in the slightest sketch, and by suggestion create or revive the spirit of a form or place; one truth to the literal facts, from which the soul that animated them may have fled, and which may want the magnetic touch that was the life of the thing itself. Of course, if one could have them both it would be best; but, if one must choose between them, is not the spirit better than the letter?

#### The Colouring of the Temple of Theseus.

A. VON QUAST.

The pigments were not merely a thin glazing of colour to stain the marble, but were applied as a thick opaque coating upon it, so as to entirely conceal the material beneath; and of such coating the Temple of Theseus retains more traces than any other. For the most part the colour, especially that produced by blue smalt, has quite disappeared, leaving only a gray crust on the surface; yet the original hue may even now be detected. In this edifice the prevailing colours were blue and red, both of a full, deep tone, yet so applied that one or other of them formed a darker ground, relieving that placed upon it. The corona was a full blue, and the guttæ beneath it a brownish-red tint. The leaves of the foliage on the cymatium were alternately red with blue streaks and blue with red ones; while the intervals between the leaves were filled up with green, which last-mentioned colour is that of the small leaves on some of the lesser mouldings. Some of the coffers were painted of a brownish-red, inclining to violet, against which green ornament relieves itself. Others, on the contrary, show red stars on a blue ground. The plain architrave of the portico was a bright red, while the frieze was blue with figures in relief upon it, painted in their natural colours, or, in the language of heraldry, proper. The walls themselves were yellow, as is proved by the traces of that colour still remaining on them. How the columns were coloured it is not easy now to ascertain. Apparently only the echinus of the capital and the edges of the flutings were painted, while the flutings themselves displayed the pure and highly-polished white marble.

#### Roofing Slates.

J. BEETE JUKES, F.G.S.

The finest and largest roofing slates seem to be those of a bluish-grey or pale-green colour. When they become either very red or quite black they are more brittle and more readily decomposed, owing probably to the presence of peroxide of iron in the one and carbonaceous matter in the other.

#### Æsthetics.

PROFESSOR FLEMING.

Æsthetics (*aisthesis* = perception or feeling) is "that science which refers the first principles in the arts to sensation and sentiment, as distinguished from mere instruction and utility," the science of the beautiful and the philosophy of the fine arts. Various theories have been entertained as to the idea of the beautiful by Plato, Plotinus, and Augustine. In modern times the term "æsthetics" was first used in a scientific sense by A. Baumgarten, a disciple of Christian Wolf. In his "Æsthetica," 2 vols., 8vo, Frankf., 1750-58, he considered the idea of the beautiful as an indistinct perfection or feeling accompanying the moral ideas. Mendelssohn and others identified the idea of the beautiful with the idea of the good. Shaftesbury and Hutcheson regarded the two ideas as intimately connected. At the close of the eighteenth century æsthetics was scientifically developed in Germany by Kant, and has been zealously prosecuted by Fichte, Schelling, and Hegel.

#### English Houses.

SIR ARTHUR HELPS.

There is probably no branch of human work in which mal-organisation or non-organisation is more visible than in building. Here, too, it will be found that several primary considerations have never been settled. Ask an ordinary builder what thickness of what material is requisite to keep out noise, and you will find it is a question he has never considered. Yet surely it is one of the first necessity. Then, again, in building it seems never to have been considered that families differ in number; and, accordingly, wilfully ignoring this consideration, great contractors take large plots of ground and cover them with exactly similar houses, which are perhaps equally unsuitable to large and to small families. The buildings, however, look all alike outside, which is held to be a most attractive circumstance. They are turned out something like the toys for children. Yet surely, even as far as gain is concerned, greater profit would inevitably follow greater convenience. Nowhere

is routine more observable than in building. Lady Mary Wortley Montagu, when she revisited England after being in the East, observed that everybody's reception-room seemed to be constructed after the fashion of a grand pianoforte; and the pianoforte style has held its ground ever since, though very little can be said of its merits. Again, one would have imagined that climate would be much considered by architects and builders, whereas they often seem to think it a slight matter, and houses are constructed after the same pattern for wet and dry, for cloudless and beclouded districts. Occasionally, amongst primitive people, these manifest realities are thought of and allowed for; but, when you come to highly-civilised communities (which ought, by the way, to furnish the best builders), buildings are turned out, for the most part, in a set pattern, and that a bad one.

#### Cutting Timber.

SIR JOHN ANDERSON.

The strength of a piece of timber depends upon the part of the tree from which it is taken. Up to a certain age, the heart of the tree is the best. After that period, it begins to fail gradually. The worst part of a tree is the sap wood, which is next the bark. It is softer than the other parts of the wood, and is liable to premature decay. The deleterious component for the sap wood is absorbed if the tree is allowed to grow for a longer period, and in time the old sap wood becomes proper timber fibre similar to heart wood. Hence the goodness of a tree for timber purposes depends on the age at which the tree is cut down. When young, the heart wood is the best; at maturity, with the exception of the sap wood, the trunk is equally good throughout, and when the tree is allowed to grow too long, the heart wood is the first to show symptoms of weakness and deteriorates gradually. The best timber is secured by felling the tree at the age of maturity, which depends on its nature as well as on the soil and climate. The ash, beech, elm, and fir are generally considered at their best when of seventy or eighty years' growth, and the oak is seldom at its best in less time than one hundred years, but much depends on surrounding circumstances. As a rule, trees should not be cut before arriving at maturity, because there is then too much sap wood, and the durability of the timber is much inferior to that of trees felled after they have arrived at their full development.

#### Brickwork.

PROFESSOR RANKINE.

The following principles are to be observed in building with bricks:—(1) To reject all misshapen and unsound bricks. (2) To place the beds of the courses perpendicular, or as nearly perpendicular as possible to the direction of the pressure which they have to bear, and to make the bricks on each course break joint with those of the courses above and below by overlapping to the extent of from one-quarter to one-half the length of a brick. (3) To cleanse the surface of each brick, and to wet it thoroughly before laying it, in order that it may not absorb the moisture of the mortar too rapidly. (4) To fill every joint thoroughly with mortar, taking care at the same time that the thickness of mortar shall not exceed about a quarter of an inch. In order to prevent the use of too great a thickness of mortar, it is usual in specifications to prescribe a certain depth, which a certain number of bricks shall not exceed. For example, if the bricks are  $2\frac{3}{4}$  inches deep, it may be specified that four courses of bricks, when built, shall not measure more than 1 foot in depth, a condition which implies that the average thickness of mortar in the joints shall be  $\frac{1}{4}$  inch. (5) To use no bats or pieces of bricks, except when absolutely necessary, in order to make a "closure," that is, to finish the end or corner of a wall, or the side of an opening, and even then, to use no piece less than half a brick.

#### Coating Water Pipes.

J. F. BATEMAN, F.R.S.

When pipes are coated with asphalt they will deliver a much greater quantity than any estimated results. The 4-feet pipes at Glasgow were calculated to deliver 20,000,000 gallons in twenty-four hours with 5 feet per mile inclination. They have delivered 26,000,000 with  $3\frac{1}{2}$  feet. The expense of asphalt was about 5s. a ton.

**Allerton, near Cannes.**—When describing this building on March 21, we omitted to state that Mr. E. C. Soper, of Cannes, had acted as clerk of works, and superintended the entire erection of the building under the architect, Mr. Waterhouse, A.R.A.

**Messrs. Chubb & Sons** have subscribed 500*l.* towards the Guarantee Fund of the Colonial and India Exhibition, which is to be held next year in London. The fund amounts at present to 152,950*l.*

## NOTES AND COMMENTS.

THE colossal statue of *Liberty*, which was beaten out of a vast number of plates in Paris according to the model of M. BARTHOLDI, seems fated to suffer grievances. By what enthusiasm and self-denial a figure 120 feet in height was created may one day be related. The plates were numbered, put up by means of temporary rivets, and when all were found to be complete were taken down, put aboard barges on the Seine, and brought to Rouen in safety. There they still lie. A French transport was assigned by M. FERRY to bring the plates to New York, and it is expected from Cherbourg every day. But it is uncertain whether the cargo will be delivered. Eight years ago the United States Congress resolved to undertake the conservation of the statue. That supposes the work will be complete, including the apparatus for the electric lighting of the flambeau. Congress will not, however, vote a dollar towards the completion of the pedestal and the erection of the figure, owing, it is believed, to the prejudices of the German population in the States. An improvised meeting has been held on board one of the American steamers, and subscriptions amounting to 4,000*l.* have been promised. They have not been paid, and until that sum is in the bankers, M. BARTHOLDI's plates will remain without an owner. The transaction does little credit to the States.

THE costume ball of the Royal Institute of Painters, which is to be held next month in Piccadilly, will be preceded by a series of *tableaux vivants*, entitled a "Masque of Painters," which will be representative of the great artists from PERICLES to REYNOLDS. There are to be six groups, viz.:—Greece, arranged by Mr. A. SACHEVEREL COKE; Italy, by Mr. WALTER CRANE; Germany, by Mr. J. D. LINTON and Mr. W. DENDY SADLER; France and Spain, by Mr. R. CATON WOODVILLE; Holland, by Mr. E. A. ABBEY and Mr. T. WALTER WILSON; England, by Mr. SEYMOUR LUCAS and Mr. CHARLES GREEN. The whole will be described in verses written by Mr. EDMUND W. GOSSE, and spoken by Mr. J. FORBES ROBERTSON as Chorus.

THE late GUSTAVE DORÉ was more esteemed in London than in Paris. Here he was supposed to be a nineteenth-century MICHEL ANGELO; in Paris he was believed to be an admirable illustrator of books, who might have been a painter if he had been taught. There was a sale last week of the pictures left in the artist's studio. Not one was purchased for a public gallery in France. The largest price was given for the *l'Aigle*, and it was only 250*l.* One of the Scotch landscapes, in which DORÉ was at his best, was sold for about 140*l.*, and another for 50*l.* The models for sculptured figures were sold with the right of reproduction, but the prices may be judged from M. DUMAS having obtained a large group, representing *Christianity*, for 8*l.* DORÉ's industry was that of a giant, and there was an immense quantity of works remaining in his studios. In spite of the low prices, they realised together nearly 5,000*l.* DORÉ contemplated an illustrated edition of "Shakespeare," and, it is said, demanded a million of francs for his designs. No English publisher was sufficiently enterprising to accept the offer. Some of the sketches for "Macbeth" were sold at about 5*l.* a piece.

THE photographs which have just been published by the Society for Photographing Relics of Old London would indicate that, in spite of time and change, the metropolis is inexhaustible in its picturesqueness. This year the portfolio is essentially a legal one. As Middle Temple, Inner Temple, Gray's Inn, Clement's Inn, Clifford's Inn, and Staple Inn have been utilised, it is only the adherents of Lincoln's Inn who have any right to complain. Architecturally the subjects are most interesting. We have the gateway to the Middle Temple, which an astounding advertisement cannot vulgarise, and the still more stately entrance to the Inner Temple; Fountain Court, taken on a day when the water was laid on more profusely than is customary, the grand hall, where so many feasts and revels were held, and in which "Twelfth Night" was played; the rival hall at Gray's Inn, with some of the best "bits" about the Courts. In

addition to the stately buildings, there is a sheet of smaller subjects, including the *Wooden Midshipman*, which is as familiar to the readers of "Dombe and Son" as Captain CUTTLE himself. The quality of the photographs is up to Mr. DIXON's usual standard, and Mr. MARKS may again be congratulated on his success in producing so many excellent plates for a very small subscription.

M. CHARLES GARNIER is this year the most popular architect in France, since he stands at the head of the Salon Jury with eighty-two votes. Whether the position is owing to respect, or as compensation for the proposal to remove his opera house, has not been stated. The remaining members of the jury are MM. QUESTEL, BRUNE, BAILLY, VAUDREMER, ANDRÉ, DIET, HÉNARD, BÆSWILWALD, DAUMET, NORMAND, and SEDILLE. The supplementary jurors are MM. RAULIN and GINAIN. The outsiders who received the highest votes were MM. CORROYER, BALLU, MAYEUX and GUILLAUME.

It has been found necessary to overhaul the roofs of the Cathedral of St. Peter in Geneva, where an enormous mass of *débris* had been collected during a couple of centuries. The strange things which have been discovered would go far towards a solution of the difficult question about what becomes of all the pins. Among the odds and ends are a child's primer dating from 1545, a Testament on parchment of the same period, fragments of manuscript and of earthenware, &c. How they soared to that position will afford subjects for speculation to the Swiss physicists. The greater part of the objects will be sent to the public library of Geneva.

Two competitions have lately been decided. In one, for a new church at Mosley Common, near Tyldesley, Mr. WORTHINGTON, F.R.I.B.A., reported in favour of a design by Mr. F. H. OLDHAM, of Manchester. The building is to be undertaken without delay. The second competition was for the public buildings in Newcastle-under-Lyme, for which thirty-seven sets of designs, or about two hundred drawings, were sent in. Mr. T. M. LOCKWOOD, of Chester, was appointed architect. The first premium of one hundred guineas has been awarded to a design marked "For England, Home and Beauty," which was found to be the work of Messrs. J. BLOOD, W. H. SUGDEN, and W. SUGDEN & SON. The second prize of thirty guineas goes to Mr. J. W. E. TILLEY, of Belfast, for his design marked "Mind and Body," and the third of twenty guineas to Mr. H. A. CHEERS, of London, whose design was signed "Bona Fide." It is to be hoped that there will be no departure from the legitimate and honourable course in this case, and that the winners of the prize may be enabled to carry out their design. The announcement that four of the designs set aside by the assessor have been taken into the Council Room is, however, ominous. Mr. LOCKWOOD is an architect who has had a large experience; he has built municipal buildings, and the Council can be assured that he is never likely to recommend a design which would be unsuitable, or pass by a good plan in his selection.

THE architects and engineers of the Municipality of Rome have advised the suspension of the custom of illuminating the ruins of the Coliseum with Bengal lights. The reason given is that the place is dangerous, owing to the excavations which have taken place for the purpose of ascertaining the nature of the underground arrangements. The accounts of the scenic displays, especially those of a nautical kind, were a puzzle to archaeologists, and they were able to prevail on the authorities to allow the ground to be torn up, when the remains of several brick walls were seen. A correspondent of the *Standard* says:—"The huge waterlogged pit which the *savants* dug has remained yawning ever since, poisoning the air inside the building by its exhalations, and destroying, as far as destruction is possible, the beauty of the scene. But if it is true, as all who have examined these excavations will think possible enough, that the safety of the world-famed structure has been really endangered, it is difficult to measure the atrocity of the mischief done, or the indignation which will light on the heads of those who have been guilty of it."

By J. H. P. & Co. 1885

DESIGN FOR THE DECORATION OF A HALL AND LANDING.

BY CHRISTR GILL.

## ILLUSTRATIONS.

THE REVENGE OF ATHALIE.

THIS illustration has been taken from M. SIROUY's reproduction of SIGALON's picture in the public gallery at Nantes, and is described in an article on another page.

DESIGN FOR DECORATION OF HALL AND LANDING.

THIS design shows a portico brought forward into the hall, the top to form a balcony in the balustraded landing above. On the left, an ebony and ivory cabinet, with a background of terra-cotta and greyish green tapestry. The walls above a blueish-grey, plaster frieze in gold and brown, and woodwork dark oak. The drawing is by Mr. C. GILL, of 9 Fitzroy Street, W., and was exhibited at the Academy last year.

## THE PRINCIPLES OF SURFACE DECORATION.\*

BY WILLIAM MORRIS.

THERE are several things to be considered in designing for the flat surface of a wall, or for the surface of a woven hanging, &c., which make it different from the designing of a picture. In all pictures there is a distinct statement of fact, mingled with the intention of impressing the beholder with beauty of colour or line. All the forms in a picture have definite meaning; they tell a story. This is a man, so dressed, so standing; or, this is a landscape, trees grow so, mountains look so under such and such conditions of light, and so forth. But in surface decoration this is not necessary. You may have decoration, as in some Arab art, which simply aims at pleasing the eye by the repetition of certain arrangements of lines, spaces, and colours that do not recall to the mind any forms or events of nature.

It would, however, be tyrannically monotonous to confine the designer of flat ornament to such simple and meaningless forms, and such ornament would soon cease to please if used by itself. Accordingly we find that no schools of art have ever been contented to use nothing but abstract lines and forms and colours—that is, lines, &c., without any meaning. The forms of nature have been always used largely even in simple surface decorations, and especially those of the lower forms that have growth and life in them, that is, flowers, fruit, leaves, and the like. But these are used in one way or other differently from what they would be in a picture; they are not used as statements of fact, but as conveying hints of the impressions produced by the facts. And in doing this it is better to sacrifice some of the naturalness of the nature hinted at in detail in order to get a clearer impression of the idea of the nature; besides, in most of the surface ornament that we use, the design is repeated mechanically, as in a wall-paper, for instance; and this mechanical repetition necessitates a geometrical arrangement of some sort, however skilfully it may be veiled; so that if the designer ties himself to close and accurate delineation of nature he will have to limit himself to a small fragment of it repeated over and over again in geometrical order. This would certainly lead to poverty of invention in a design and most probably to awkwardness of line and arrangement. It is better, therefore, as aforesaid, to sacrifice some of the direct imitation of nature so that we may make our lines more suitable to the geometrical arrangement, and that we may remind people more of the intricacy and beauty of nature.

Moreover, we are almost always, in surface decoration, working with materials more or less intractable; we are not drawing freely with a brush or pencil, but are printing with a block, or building up a mosaic of coloured threads as in woven work. To imitate nature closely, therefore, is really impossible, and to attempt to do so is only to show our weakness, and results in a poor and commonplace effect devoid of invention. What we ought to do, I repeat, is to give a vivid idea of the impression which that nature has produced on us; and, as people have different impressions of the same place of nature, this will give rise, if we work wisely and truthfully, to that individual invention which is the greatest charm of decoration, or, indeed, of all art.

As an example, suppose a designer impressed by the beauty of a hawthorn bush and a jasmine spray. How are we to cover a room wall with this idea, carried out by block-printing on paper of a recurring design? We may at once admit that if we could paint the whole wall with a varied picture of these two pieces of natural growth, it would be far more beautiful

than any recurring design could be; but not only could this seldom be done, but also, when we had skill and time to do it, we perhaps had better go further than the bush and the spray, and paint human figures also, and tell a tale by our art. We have chosen these lower forms of nature because we can treat them less seriously without losing the idea of their beauty. Now we might simply take a bough of hawthorn and a spray of jasmine and draw them without much arrangement, and so print them on the paper. But, so done, not only would it be difficult to make them take good lines on the wall, but also our materials would but poorly imitate the delicacy of nature, and at the best, when it was all done, it would not remind us of anything beyond what was visible there—it would be just a hawthorn bough and a jasmine spray always recurring till we got tired of it. The better plan would be to form in our own brain some arrangement which would remind ourselves of the beauty of the bush and the spray, while we made it clear to everybody else that we were thinking of hawthorn and a jasmine, and to interweave these two in such a way that they would make agreeable lines on the wall, and give people a hint of the mystery and intricacy of nature. In fact, beauty mingled with invention founded on the observation of nature is the mainspring of decorative design. If it is not beautiful it has no right to exist; if it is not inventive it becomes wearisome; if it is not founded on observation of nature it can hardly be either beautiful or inventive. It is apt to become merely strange and monstrous when it departs far from nature.

Now we often, as above hinted, have to deal with materials much harder to use than mere block-printing, and we may take it as an established fact that the more intractable the material is the less we should attempt direct imitation of nature; yet, on the other hand, the more beautiful in themselves the lines of the design should be, and the design the more thoughtful and inventive. And you may take it for granted that if a man does not enjoy working in these specially difficult materials, if he does not find that the difficulties stimulate his invention, he has no real turn for designing surface ornament.

A word or two may be said as to colour generally. Students of design should remember what the uses of colour in surface decoration are, namely, to give a pleasant general impression. For wall decoration sobriety of colour is always more or less necessary; but this should never degenerate into dirty or turbid colour. The paler the colour is the purer it may be. Pale, pure colour is the best tone for wall-papers or flat painted ornament. The richer and deeper colours are best kept for rich materials, or for small confined spaces of colouring, as a cornice or pilaster, &c.

## MILLET AND MODERN ART.

A LECTURE was delivered in Edinburgh, on Saturday, by Professor Baldwin Brown, on "Millet and Modern Art." The professor commenced by saying that the Scottish Atelier Society had, with great kindness and liberality, placed their room at his disposal for an occasional lecture of a conversational kind on subjects interesting to the practical student. The Atelier was a great benefit to the cause of art in Edinburgh, as it afforded opportunity for those already in professional practice to continue a little longer their studies from nature, while those who were as yet only beginners would have the advantage of working by their side. Considering the necessarily small number that can be accommodated at one time in the life class at the Academy, such an institution as the Atelier had an important work to perform, and one of the greatest of its benefits would be that it would afford to ladies an opportunity of acquiring training for a profession in which they have shown themselves so well fitted to attain to high distinction. The occasional lectures, of which this was the first, would be sometimes on old art, sometimes on new, and especially on old art in its bearing upon the work of modern times, and their object would be to bring the working student into contact with the great achievements of the past. Dividing the painters of the world into two great classes, represented centrally by Raphael and by Rembrandt, the lecturer showed that the followers of the latter represent nature as a whole, not merely "select" nature. The modern artist does not deal with heroic subjects or beautiful forms alone, but with what is homely, and even, when judged by the classical standard, ugly. He must give artistic value to these themes by his sympathy in the broadest sense with human joys and sorrows, and by his treatment of light and shade, and colour, his touch, and technique generally. The term Realist was often misapplied, and the modern artist might give a truly ideal treatment of nature not by pre-Raphaelite copying, but by transforming common things through the magic of art. Jean François Millet was a representative of modern art at its best. A peasant and painter of peasant subjects, who refused to beautify the hard facts of life up to an academic standard, he was yet a man of intellectual culture

\* A paper prepared for explanation of designs exhibited at the Educational Conference, Manchester.

and a passionate admirer of the old masters. His nature was pure and tender, his mind stored with great thoughts. In his rustic breeding, his poetic nature, and his wide sympathies with all that was great in humanity he resembled Burns. Millet was born in Normandy in 1814, of a good peasant stock, and till the age of eighteen worked on his father's farm. He received a fair education and learned to read Virgil, whose "Georgics" influenced his after treatment of rural subjects. Having received some artistic teaching at Cherbourg, he went to Paris, and devoted himself for a time to enthusiastic study of the old masters. Finding that he could sell nothing but nude figures and studies in the style of Watteau, he determined to leave Paris and give himself entirely to peasant subjects. From the year 1849 to his death in 1875 he lived at Barbizon, near Fontainebleau, and executed his characteristic works, photographs of some of which were exhibited. What was now the keynote of Millet's work? It was not the picturesqueness or the idyllic charm of the country that attracted him, but the toiling life of the peasants in all its stern reality. He was accused of Socialistic views, and of wishing to set the poor against the rich, but there was nothing of the sort in his mind. He took facts as he saw them, and though, as he said, the charm and glory of the country was fully apparent to him, he could not help seeing as clearly the labour and suffering of the poor, and in this spirit he painted his famous *Man Resting on his Hoe*. There was a grander note, however, in Millet's work, as illustrated in his *Sower*, where the labour of the fields received a dignity from its primeval character and its connection with the changes of the eternal seasons. This was in the spirit of Virgil. The artistic character of Millet's work was then noticed. The grandeur of form he gave to his peasant figures, the art with which he glorified common or ugly themes, the force of his painting and his beautiful colouring, received illustration, and quotations from his letters were given, one of which, the lecturer said, contained the gospel of modern art:—"We can start from any point and arrive at the sublime, and all is proper to be expressed, provided our aim is high enough."

#### CLASSICAL ARCHÆOLOGY.

A COURSE of lectures on Greek art has been delivered in Edinburgh by Professor Baldwin Brown. In closing the series some remarks were made on classical archæology:—

The classical languages, he said, open up to us so large a portion of the history of human development that there is little danger that the study of them will really decline. Such studies may, however, to some extent have to be liberalised. The movement against classical studies is due largely to a natural reaction against the somewhat narrow and exclusive spirit in which they have often been pursued. Pure textual scholarship and composition have a great charm, and provide a very refined form of mental training, but it is rather a training for the few who can enter into the "inner circle" of the scholar's lore. To the mass of pupils, for example, educated on the old-fashioned English public school system, making verses is a sort of mechanical knack, and translation the acquisition of the proper number of traditional interpretations of obscure passages. In the present day more life is being infused into classical studies by stimulating the pupil's interest in the subject-matter of his books, and by illustrating them from the facts of ancient life. Here is where the study of classical archæology will find its place. Under this head are comprehended all forms of ancient art, and art among classical peoples was so universally diffused that almost everything that was made, and a good deal that was done, took an artistic form. Hence the references to art in its various forms in ancient writers are innumerable, and though it is possible to elucidate these references by the use of dictionaries and commentaries, it is far better to acquire a clear general idea of the subject as a whole, which may provide a sort of running artistic commentary on ancient literature. In the case of Homer it is possible now to reconstruct almost every one of the numerous artistic objects mentioned in the poems, either from the evidence of recent discoveries or from Egyptian wall paintings and similar sources. The lyric poets, who belong to a very interesting age of Greek art, need an artistic commentary, and so does Herodotus. In the Attic age politics become the prominent theme, and Thucydides seems to show a studied avoidance of all reference to the picturesqueness of the external life of his time. Plato, on the other hand, is full of references to this outward life, in which art was so important an element; while Aristophanes is not intelligible without the aid of archæology to explain his allusions to buildings, dress, furniture, utensils, and habits of life. The "Bacchæ" of Euripides, illustrated by Mr. Sandys from works of ancient art, is a sign of the new interest in this side of classical scholarship. The Roman poets need also this sort of interpretation, and the architecture and topography of Rome and Roman portrait statues

are the wonder of all who would read the historians with satisfactory results. It may be taken as certain that the liberalising of classical studies will consist in no small degree in bringing to bear on them the results of a knowledge of the remains of ancient architecture and art. Hitherto this knowledge has chiefly been centred in Germany, where chairs of archæology are abundant, and where it forms one of the regular subjects in the university curriculum. Hence there are many teaching positions open to those proficient in the subject, and it (archæology) becomes a recognised career. This has not hitherto been the case in Britain, but of late years a beginning has been made, from which much may be expected. There are chairs of Archæology at Cambridge, and a fine new museum of casts, such as we ought to have in this city. There is a chair at University College, London, occupied by Professor Newton, the first of British archæologists. At Oxford there has been recently founded a chair of Classical Archæology, and a Scotsman of eminence in antiquarian exploration, Mr. Ramsay, has been selected to fill it. There, too, is to be a museum of casts. At South Kensington a museum of casts has been opened, while the courses of lectures on ancient art and its remains at the British Museum are becoming increasingly popular. Further, in secondary schools efforts are being made to interest boys in their classical studies by giving them some idea of ancient buildings and works of art. No school class-room is complete without its photographs and drawings, or its casts, and the interest thus excited will be sure to increase as greater and greater facilities are given for following this branch of study. A class for classical art at this university is not only a right thing to be instituted at a great seat of learning, and in a city famous above all things for its educational facilities, but it will also be found to answer to practical requirements. It is certain that questions involving a knowledge of ancient art will find their way more and more into the examination papers for classical scholarships. It is certain, too, that those who seek masterpieces in secondary schools will find it of advantage to have a knowledge of something more than the mere text of classical writers. Ancient art has a good chance of finding itself soon in the satisfactory position of a "paying subject." There is every hope, therefore, that this study of archæology may before long find a firm footing in our midst.

#### GLASGOW ARCHITECTURAL ASSOCIATION.

THE annual opening of the Glasgow Architectural Association was held on Tuesday evening, the 7th inst., in the Langham Hotel. About forty gentlemen sat down to supper. The honorary president, Mr. Sellars, was in the chair; Mr. Chalmers, president, officiating as croupier. In proposing the toast of the evening, "The Glasgow Architectural Association," the chairman commented very favourably on its activity and the position attained; while in noticing the excellent character of the work proposed to be overtaken during the new session as generally of importance, he very specially approved of the construction class.

The past honorary president, in his remarks, speaking of the importance of good draughtsmanship, gave it as his opinion that the drawings done by members last session had surpassed those of any former one. He then announced that his prize, offered for the "best collection of sketches and measured drawings," had been awarded to Mr. William James Anderson; while the Association's prize—subject, "Design for a Boarding School for Forty Boys"—confined to pupils, was awarded to Mr. Andrew H. Prentice, a second prize going to Mr. William Watson.

The other toasts were:—"The Queen," "Army, Navy, and Volunteers," "Kindred Societies," replied to by Mr. Barclay, F.R.I.B.A., for the Royal Institute, by Mr. Watson, F.R.I.B.A., I.A., for the Glasgow Institute of Architects, by Mr. Landless, I.A., for the Architectural Section of the Glasgow Philosophical Society, and by Mr. G. W. Browne for the Edinburgh Architectural Association, of which he is president. Songs and recitations filled up the rest of the evening. Specimen sheets of the Association sketch-book and the Association prize drawings were exhibited, and inspected by the members and their friends.

The secretary's report states that there are forty-two members of the Association, showing an increase of two over last year; fourteen new members have joined and twelve have left. With its increasing membership, the Association's scope has widened so as now to offer, if not the most perfect curriculum imaginable, at least the best presently to be had; it is, therefore, deserving of even greater support than it receives from architectural students. The liability to consider drawing as the paramount object of attention is avoided by such an Association, which includes in its syllabus, essays, designing, practical and theoretical construction, &c., thus combining the merits and attractions of a literary society with that of a technical. Specially should the essays commend themselves,

as they form the unique feature of the Association among kindred societies; the position as juniors permitting the preparation and delivery of papers, both historical and critical, which adds an explicitness to the mere amount of information gained by reading; while the discussions provoked among the members tend to a readiness and a breadth of view in the consideration of matters architectural. Because of these personal advantages, as well as the desirability of professional co-operation and mutual assistance, the committee look forward hopefully to an increased roll and an augmented prosperity.

## Bygone.

*"Antiquity after a time has the grace of novelty."*—HAZLITT.

### THE HOOPING OF THE DOME OF ST. PETER'S ROME.

IF guide-books and other descriptions of Rome are to be taken as evidence, it would seem that among the "things not generally known," the iron bands which encircle the drum and dome of St. Peter's may be included. Soon after Bernini had made staircases and niches in the great piers it was observed that the cupola was rent, but no importance was attached to the defects. Carlo Fontana was appointed architect in charge of the Basilica, and he wrote a book to give the world assurance of the safety of the building. But in spite of talk and type, the cracks became larger, and in 1742 the subject excited commotion in Rome, when a scientific commission was appointed. The following account of their inquiry was compiled by Cardinal Wiseman from the original reports, and is published as a "Bygone" by the kind permission of Messrs. Hurst & Blackett. We may add that the conclusions of the reverend scientists were generally accepted. Out of nineteen opinions which were obtained on the report, the majority agreed that the hooping was the best device. Giovanni Poleni was, however, summoned from Naples, and he expressed an opinion that the dome was not in danger. He attached no importance to the cracks, which he considered were partly the results of the enlargement of some of the piers, by which they sank more than others, and partly the results of hasty building. The variation of the drum from the perpendicular he ascribed to settlements, and not to the pressure of the superincumbent dome. But as Poleni advised the adoption of five circles of iron around the dome, it may be said that he came to the same conclusion as the mathematicians, who proposed six colossal hoops to give security to the cupola. A sixth was added, and there are now eight. The work was completed in 1747, and was carried out under the direction of Luigi Vanvitelli or Van Witel, the architect of the Caserta Palace, the Convent of Sant' Agostino, and other buildings in Italy. Each hoop consists of thirty pieces, and they are covered with brick in order to be preserved from rust.

There is a popular idea current, that Michel Angelo made the huge piers, on which the dome had to rest, so exactly proportioned to the weight they had to bear, that he even made a dying request that they should never be touched; that they were afterwards perforated to make some staircases and niches, and that the consequence was, that the whole dome was threatened with ruin. All this is incorrect, as I will show you just now. It is not likely that Michel Angelo, whose characteristic was massiveness to excess, would have so offended. But in addition, it deserves to be mentioned that, at the time when he built these piers, a commission was appointed, of which I believe Raffaele was a member, to examine them; and that their report was, that the piers should be still further strengthened. Immensely deep wells were accordingly sunk at their feet, and filled with Roman concrete—which is the strongest, I suppose, in the world—so as to give great additional support.

It will be useful to give you the exact dimensions, in English feet, of the great masses concerned in what I am about to speak of.

Piers, on which the dome rests, 282 round.

Cupola, diameter, 141½.

Circumference, about 423.

Height of arches, on which it rests, from the pavement, 146.

Height of lower edge of dome, 171½.

Total height to summit of lantern, 446½.

Perhaps the greatest promise ever made by art, and faithfully kept, was here. Michel Angelo is said to have declared that he would raise the Pantheon up into the skies. These dimensions show how he kept his word.

About 1681, it was observed that there were numerous cracks in various directions, through the cupola; and great

blame was thrown upon Bernini, who was accused of having made dangerous staircases and niches in the piers; however, his friend and biographer, Baldinucci, produced plans of earlier date, in which these alterations were marked; thus disproving that Bernini had been their author. He moreover speaks of the fissures then apparent as trifling. But they went on increasing. What are called in Italy seals—that is, marble dovetails, were placed across the cracks; and these broke, or were breaking with alarming rapidity. It was evident that the work of destruction was going on; and before the middle of the last century it was feared that, in a few years more, the whole dome of St. Peter's might fall in.

Architects came forward to suggest various remedies for the threatened evil. One wanted to block up the windows, another to make great spurs or buttresses, in addition to the columns that surround the cupola, to give it strength. In truth, the whole structure would have been disfigured by the proposed expedients; but in reality, it was difficult to find a remedy. Benedict XIV., a most able and learned man, was pope at the time. He wisely observed that this was not the business of art, but that belonged to science. So he named a special commission of three mathematicians—pure mathematicians, having nothing to do with building or architecture, to examine the case. When I mention their names, scientific persons will easily understand how they were selected.

At the head of the commission was Father Boscovich, a Jesuit, who had twice measured arcs of the meridian, and had published a number of works on astronomy, on the spots on the sun, on optics, and many other philosophical subjects; a man, in truth, of European reputation, and one of the first men in Italy who accepted the Newtonian system. The other two were not Jesuits, but religious of another order. They were the editors of what is commonly called the Jesuits' Edition of Newton, Le Sueur, and Jacquier; men purely and exclusively scientific. How did they go about their work? As scientific men would naturally do, with great care and caution, as well as ability.

As they drew up a minute report of their proceedings, under the modest title of "Opinion of Three Mathematicians," and presented it to the pope, I have only to abridge their own account of them. It was given in at the close of 1742; and they commence their paper by apologising for apparently intruding into a province not their own, and pleading for their excuse the sovereign command; showing, at the same time, how science has properly to deal with such a matter.

Their first care was to examine most minutely the entire dome, within and without, and form thus a plan of all the injuries which it had suffered. They give an accurate list of thirty-two distinct damages, some very severe, and running in various directions. The stone lintels over several of the windows were split in two. And when they applied a plumb-line to the buttress-pillars round the drum, or cylinder, of the dome, these proved to be as much as over an inch out of the perpendicular.

This naturally pointed to the over-pressure of the spheroidal portion, with the lantern above, upon the drum. But our three mathematicians were not satisfied with this simple deduction; they carefully examined the piers to which popular judgment attributed the damage; and they found that judgment to be erroneous. The piers were intact, and required no attention. They therefore advised that nothing should be done to them. Thus having formed the hypothesis of over-pressure, they proved that every phenomenon, to the slightest crack, fell into it, and was adequately explained by it, and by no other.

Their next step was to verify most exactly the reality of what they had theoretically ascertained, by weighing, on the one hand, the materials supported, and measuring, on the other, the sustaining power. I will not detain you with details, which are minutely given in the original memoir, but present to you the general results. Having exactly weighed measured portions of the materials used in the construction of this wonderful building—the stone, brick, copper, lead, and iron—and then, from accurate plans, and by sound calculations, having measured the quantity of each, they found that the entire dome, with its lantern, came to the frightful weight of 165,000,000 of Roman pounds, or 55,245 tons.

They obtain separately the weight of the gravitating portion; and then calculate the resistance or supporting powers. This consisted, first, in the drum (*tamburro*), with its pillars thrust already out of the perpendicular; and secondly, of an iron girder, too slight for its purpose, but so embedded in the wall that it could not be examined. They estimate, however, its tenacity, and take it into reckoning; but conjecture that it had either snapped or dilated, so as to be useless.

But they thus reached the awful result—that there was a balance of 5,000,000 pounds, or 1,674 tons, on the side of pressure against support. The conclusion of the mathematicians was, "that an irreparable ruin was reasonably to be apprehended, unless a timely and efficient remedy were applied."

We may well imagine the alarm of Rome, with its artistic

population, at such an announcement as this; and at hearing that this collapse and ruin had only been prevented so far by an iron collar round the base of the lantern, and by the peculiar construction which united the double dome to this, so as to prevent its falling out.

It is easier to find a defect, and prognosticate misfortune, than to remedy the one or to avert the other. But the commission to the three mathematicians was, not only to probe the evil, but also to suggest its "efficient cure," which they consequently proceeded to do.

Well, what sort of a remedy did they suggest? One entirely scientific, and not a little appalling. It was to put six more solid girders round this huge periphery of 420 feet. Each, of course, was to be divided into several sections, or arcs; and where these met, each had to branch into three; and these branches proceeding from the two arcs, were to be fastened by bolts passing through sockets in them; the bolts again being rivetted to chains passed round the building. A gigantic or Cyclopean undertaking; for you must remember that there were then and there no Nasmyth's hammers, or Birmingham rolling-mills; so that the enormous hoops had all to be forged and shaped by hand.

Of course, no sooner had this report appeared than it was assailed in all its parts—groundwork, deductions, and proposals. To vindicate it, and reply to the objections so gravely urged, and, at the same time, give an account of further proceedings in the matter, a second memoir was drawn up by the same learned men, early in the following year. A meeting of the general committee was then held, comprising architects, antiquarians, and others. A fresh examination was made; and finally the decision of the "three mathematicians" was adopted, and their proposal accepted.

There was no time to be lost, and no time *was* lost. Before the end of that year, 1743, two girders were braced round the drum. In 1744, three more were added. According to Poleni, their weight amounted to 119,044 Roman pounds, or 39 tons.

In 1747 it was found that the "mathematicians" had conjectured rightly, that the girder put in under Sixtus V. had sprung; and another was substituted for it. These iron circles are not visible, but are imbedded in the stonework.

We have here a notable instance of science coming to the succour, or rather to the rescue, of art, in one, certainly, of its most painful crises. One knows not which most to admire; the sagacity which at once recognised the power that was needed and called it in, or the free and unlimited scope given to its exercise, or the sensible acquiescence of the artistic commissioners, or the sound judgment of the scientific deputation, or, finally, the complete success of its remedy.

Without this all else, and a vast expense, would have been wasted. But the proposed cure fully answered; and now, after 120 years, no sign has been given of subsequent damage; but the seals, or dovetails, placed over the former fissures, left purposely open, are unbroken and unmoved.

### SAFETY AGAINST FIRE IN BUILDINGS.

A MEETING of the Insurance and Actuarial Society of Glasgow was held on the 8th inst., when Mr. A. B. Dansken read a paper on "Notes on Buildings."

Having given a short summary of the various Building Acts in this country and in America, Mr. Dansken said that the London and Liverpool Acts were the models for all others in England. In Scotland they had no Act really worthy of the name, the building regulations in the Glasgow Police Act consisting of only about 20 clauses. In Boston and Montreal, on the other hand, the Acts were of a more general nature than those in this country, though they contained some excellent provisions which might with advantage be adopted here. The Metropolitan Acts contained excellent structural arrangements. Liverpool had paid great attention to regulations for the storing of goods within the boundaries of the borough, while Montreal had special regulations for the erection and use of steam boilers, furnaces, stoves, and such like. Great improvement had recently taken place in the storing of goods, particularly in London and Liverpool, and what was required in Scotland was a general Building Act similar in its provisions to those of London and Liverpool. The most fruitful sources of fires in dwelling-house property were defective hearths and vents, and this was borne out by the fire returns of various cities. He found that in London out of 18,292 fires, 123 were from hearths and 1,643 from vents, a total of 1,766, or 9.65 per cent. of the whole; in Liverpool out of 4,070 fires 130 were from hearths and 370 from vents, or 12.28 per cent. of the whole; in Manchester out of 2,968 fires 644, or 21.69 per cent., were from hearths and vents; while in Glasgow out of 3,500 fires 228 arose from defective hearths, and 745 from vents, a total of 973, or 27.8 per cent. of the whole. The percentage in Glasgow was, therefore, three times greater than in London, more than

double that of Liverpool, and one-fourth more than Manchester. The reason of that was not far to seek, for the Metropolitan Building Act required that hearths "shall be solid for a thickness of seven inches at the least beneath the upper surface of such hearth or slab;" while in Glasgow not only were there no regulations as to hearths, but the practice was to lay them on the bare wood—the most dangerous that could be adopted. Considering how gables and party-walls were built in Glasgow, it was not surprising to learn that a great many fires occurred from defective chimneys. In the construction of dwelling-house floors Mr. Dansken referred to the present method of deafening by filling in between the joists a layer of ashes or rubbish on loose boards, and suggested that if the space between the joists was filled in with concrete the floor would be practically fireproof. A floor of that kind immediately above shops would confine a fire, or at least retard its progress very considerably, and render the dwelling-houses much safer. Were that system adopted in mansion-houses there would be fewer instances of their total destruction. Having given some hints as to how to deal with lightning-rods, Mr. Dansken proceeded to refer to warehouse and shop property. As the danger from fire increased proportionally with the size of the building, he thought some legal restrictions should be placed on their limits, for the extra rates charged for large warehouses had had little or no influence in that direction. Within recent years it had become the practice to have ceilings and walls of warehouses wood-lined. That very largely increased the risk of fire; but it might be remedied to some extent by having asbestos felt under the wood-lining of the ceilings and the space behind the lining of the walls, and filled up at intervals with belting of cement or plaster. Dealing with fireproof iron doors, Mr. Dansken referred to several varieties, but said that he preferred one formed of a combination of corrugated iron and asbestos. With respect to the mode of hinging them, he thought that where practicable the hinges should be bolted through the full thickness of the wall, and that the steps of the doors should be raised higher than the floor level on either side to prevent liquid flowing from one floor to another. Mr. Dansken concluded by referring to different forms of floors suitable for public buildings, in which a combination of iron and concrete was treated in various ways.

### EXAMINATION OF RIVETTED GIRDERS.\*

THE rivet, more than any or all other forms of fastening, is used in connecting the parts of iron or steel structures, and it is doubtful if anything will ever be devised to take its place. Nevertheless, as at present used, it is subject to certain disadvantages and accidents of workmanship, which it is the business of the inspector to detect, and of the engineer to remedy or to prevent.

Perhaps the most important of these drawbacks is the liability of rivets to looseness. The object of almost all the rivets in an engineering structure is to carry transverse shear. To be convinced of this fact, if conviction be needed, one has but to consider the relations which the parts of a built member bear to one another, and the fact that rivets joining them are driven at right angles to the principal lines of stress.

Now, if a rivet be loose, *i.e.*, if its shank be separated, by any appreciable space whatever from the sides of the hole which it is supposed to fill, it is evident that it can take up, from the pieces which it connects, none of the shear intended for it, and that its hole might as well be empty. To detect this looseness in rivets, so as to have the matter corrected, is part of the inspector's duty. But as in other cases, so in this, prevention is far better than cure; and if means can be found to insure the tightness of rivets in the first place, the results will be far superior to those produced by any amount of cutting out and replacing. If, therefore, the experience of any number of inspectors or observers shall aid in discovering the causes or conditions of looseness, so that these may be removed, much will have been effected.

It is impossible, however, to lay down any infallible rules as to the parts of iron or steel structures where most loose rivets are to be found. I do not know of many other cases where it may be more truly said that "exceptions are the rule;" and therefore, while I think that the few general statements I shall make below will prove true in the long run, they may very possibly be false guides in any given case, and are only to be taken as expressions of the average of results.

1. Hand-driven rivets are more apt to be loose than those driven by power, and are more irregularly loose. That is to say, supposing an equal number of rivets to be loose in each of two members, one power and the other hand-rivetted, the loose rivets in the former are likely (if numerous) to occur in groups and series; while, in the latter, they will probably be scattered, without any regularity, over the member.

\* From a paper by Mr. James Sanderson in the Transactions of the Engineering Society of the University of Michigan.

2. Counter-sunk rivets are more apt to be loose than those with ordinary round heads. Whether rivets counter-sunk on both sides are more frequently loose than those with one full head, I am unable to say, as it is generally impossible to test double-counter sunk rivets for lateral looseness. However, such rivets will frequently move longitudinally in the hole, which is not true of the most full-headed rivets.

3. Rivets connecting thick plates or pieces of metal are more likely to be loose than those in lighter work.

4. Rivets holding lattice-bars or light cover-plates to flanges of channels, &c., are very seldom loose. If, however, a rivet passes through two or more thicknesses of metal besides lattice-bar or bars, or a cover-plate, its liability to looseness is increased in proportion to the extra thickness of metal passed through.

5. Pin-plates and other reinforcing plates, especially when fastened by staggered rivets close together, are likely to have some loose ones. In general, the closer the rivets together the more apt are some of them to be loose. In long, regularly spaced rows, the rivets are less apt to be loose than when crowded or bunched.

6. In rows of rivets, those at or near the ends are most apt to be loose. When the end rivet of the row is tight, a loose one may frequently be found second or third from the end.

7. Other circumstances increasing the liability to looseness will suggest themselves. For example, when rivets have to be cut out, and others driven to replace them, the shock of the cutting and re-driving is very apt to loosen rivets, previously tight, in their neighbourhood. This makes a loose rivet a spreading evil, and one which is peculiarly difficult to remedy. Again, it will readily be seen that, in hand-rivetting any rivet, either of whose heads is hard to get at for the purpose of holding, or heading up, is likely to prove loose. Also, that it is difficult to make a tight rivet at or very near the angle of a bent piece, or at any point where it is not easy to bring the parts together. This, too, is evident, that a rivet, in order to be tight, should fit the hole as closely as possible before driving, and should be long enough to admit of being well headed up when in the hole. A small, half-formed head is a frequent accompaniment of a loose shank.

8. I have not found that rivets holding together a large number of moderately thick plates, are especially apt to seem loose under the hammer. I doubt, however, if such rivets actually fill the holes. I suspect that a section of such a rivet would show it to be bent in the hole, and so held apparently tight, while not actually so.

9. It stands to reason that a fairly punched and reamed hole is more apt to contain a tight rivet than is an irregular one; but I do not think, from my experience so far, that drilled holes (like those generally used in steel-work) will prevent loose rivets, or even greatly diminish their number. This, of course, is not the primary object of drilling the holes in steel, but I supposed, at one time, that a great diminution in the proportion of loose rivets to tight ones would be one of the results of the process; and in this expectation I have been somewhat disappointed. This much may be said, however, that in a rough hole a slight looseness may not be detected, as a rivet may be jammed, so to speak, between projecting points; while in a smooth drilled hole the slightest space between the rivet and the surrounding metal will cause motion under the hammer.

10. After all endeavours to account in some systematic manner for the looseness of rivets, there is left a large margin of irregularity, and absolutely nothing can be said with certainty as to the rivets in a particular piece of work until they have been tested. Out of ten similar pieces, similarly rivetted to all appearance, nine may show only one or two loose rivets each, while the tenth may look, after testing and marking, like a constellation of chalk circles. And even then it cannot be said that all the loose rivets have been found, but only that none more are known to exist.

11. For the detection of loose rivets, the only method I know of is to strike each rivet with a hammer. In my experience, the motion indicating looseness is more reliably ascertained by touch than by sight or sound. As to the precise manner of testing, it will of course vary with individuals. My own method has been somewhat as follows. I strike a couple of blows with the hammer on each side of the rivet-head, placing the finger at the same time on the opposite side of the head, and in contact with the surface of the plate or piece rivetted, so as to feel the motion, if any, between the rivet-head and the solid metal. The motion is much more readily felt by touching the head which is struck than by holding the opposite head of the rivet, as is sometimes done. Looseness is also more readily detected by striking the original head of the rivet than by striking the head which is made in rivetting.

In inspecting rivets countersunk on both sides, the only possible test is obtained by striking directly on the head of the rivet, at the same time placing the fingers on the opposite head to detect longitudinal motion. This should be done, if possible, from both sides of the part rivetted.

A light hammer, about one or one and a half pounds, is preferable to a heavy one. The blows struck should not be too strong, but such as may be struck freely from the wrist.

#### Kaolin and Granite.

SIR,—I am not surprised at your correspondent "Petrus" adducing the opinion of such a man as Mr. Robert Hunt, F.R.S., for comparison with Professor Newberry's. The Hunt species of writers somehow can gain credence while men who have devoted themselves to special subjects are ignored. It has been my aim to quote passages which expressed the experience or thought of writers, in and out of England, who have a claim to be recognised as authorities. Workmen are preferable to keepers of records—so, while occasionally I make notes of what the former say, I ignore the latter. The "Tesseræ" are a collection of passages selected on the principle that the most useful books for business are those compiled by oneself. I have heard nothing of Mr. Hunt that would warrant my becoming indebted to him. He was, I believe, a tabulator, registrar, storekeeper, clerk, or something of that kind in the Office of Mines, and in his time may have consumed miles of red tape in tying-up documents. He did dabble in science—or, as he called it, "The Poetry of Science"—as a book-maker, and if reference will be made to the *Westminster Review* for April 1855, the estimation in which his peculiar sort of science was held by practical scientists will be evident. There the author is described as having "a mind disqualified by nature or by habit from pursuing aright the simplest physical inquiry."

Mr. Hunt, in the extract published last week, professed his readiness to prove that china clay never was true granite. But in the "Dictionary of Terms" which he edited there is not a sign of this bravado. Porcelain clay is in that book said to be "a substance of great infusibility, supposed by some geologists to have been derived from feldspar which has undergone decomposition." Not a word is given to suggest any other source than feldspar, and I think it may be doubted whether Mr. Hunt had made up his mind on the subject. Nor does it matter much what theory he upheld.

There may be contrary opinions on the nature of kaolin, or, as the Germans call it, porcelain earth; but I must say that, if we judge by the value of the authorities, we cannot help believing in the relation between kaolin and feldspar and granite. In my commonplace book I am unable to find any reference to an expert of standing whose views agree with those of "Petrus." It is a question which I have had to consider before now, and that was my conclusion. With your permission, I will cite a few of those authorities.

The late Professor Jukes—who was the most thorough field geologist I have had the fortune to meet, and had studied granitic phenomena in many parts of the world—says:—"Perfectly pure clay is an hydrated silicate of alumina. This is the substance known as kaolin or porcelain clay derived from the decomposition of orthoclase, albite, or other feldspars, from which the silicates of potash, soda, &c., have been washed out. In some granitic districts the granite being decomposed yields this substance, which is carried down by water, and deposited in hollows, the quartz and mica being often left behind in the state of loose sand." On any question relating to petrology there is no geologist worthy to take precedence of Professor Jukes. He is supported by Sir Charles Lyell, who says:—"The purest clay found in nature is porcelain clay or kaolin, which results from the decomposition of a rock composed of feldspar and quartz, and it is almost always mixed with quartz." Mr. Etheridge, the palæontologist at Jermyn Street (to whom, in common with most students of geology in England, I have been indebted), said, in a lecture which he delivered in the Bristol Mining School:—"The valuable clay known as kaolin or china clay is derived from the decomposed feldspar of certain feldspathic granites, chiefly those of Cornwall and Devon, which easily decompose when exposed to the weather, producing in this condition the unctuous white clay used in the manufacture of the finest porcelain." These extracts will suggest how men who are entitled to be considered as geologists think of the matter, and it is absurd to put the notions of a geologist's clerk into opposition with what is held by them.

The chemists are no less unanimous than the geologists. I can only venture to quote one—who is a host in himself on all questions relating to technology. Professor Sullivan says:—"True china consists of an infusible, very plastic, white clay, called kaolin, and an infusible, but not plastic material, termed by the Chinese *pet-un-tse*, and in English usually called flux. Kaolin is simply a clay derived from the decomposition of the feldspar element of granite; the flux

being, on the contrary, a less decomposed feldspathic mineral, containing a large amount of intermingled grains of quartz, to which is added some chalk and gypsum: even unaltered feldspar may be used for the same purpose." A. Jacquemart is nearly identical in his description of the clays.

I need hardly say that feldspar is no more than a general name for a variety of minerals which are found in connection with igneous rocks and schists. They differ in their origin and chemical constituents. Common pumice-stone and the treasured moonstone, the beautiful aventurine and the valueless ice-spar, with many other stones, come under the title feldspar. It forms a part of soils and clays, whence the German name field-spar or spath. Some mineralogists say that kaolin is that kind of feldspar called orthoclase in a decomposed condition; some give it a different name, for one of the troubles of mineralogy is the learning and unlearning of so many names for the same thing. M. Arnoux, the director at Minton's, calls it pegmatite. "We may have," he says, "no kaolin or pegmatite; then we are obliged to extract the kaolin which has been formed by the decomposition of some granite rocks, and in England we find it easily in washing the decomposed Cornish stone."

It seems like breaking a fly on the wheel to take so much trouble to demolish an absurdity—for what else is the "true granite" of Mr. R. Hunt, F.R.S., &c.? But there is so much "information" of the kind prevalent that time may not be lost in endeavouring to show its character. It was with the hope of substituting something more deserving of the name that I was induced to present "Tesseræ" to the public.

The "absolute durability" of granite, of which "Petrus" speaks, cannot be taken without qualification. If carefully selected and properly used, granite (especially granite which is not tending towards kaolin) is undoubtedly a stone which endures. But I have lived too long in a granite district not to have observed its limitations as a building stone. It cannot be called a good, all-round stone, when there is so much uncertainty about the future of arisies and mouldings. Bold, semi-circular mouldings are effective, but there is a limit to their use. Simple balustrading would not appear to be tempting to the evil agencies in the atmosphere, yet I have seen granite in that form mouldering into the strangest shapes. Polishing seals the surface and prevents decomposition. The drawback is that it can be only partially used if we want architectural effect. It might be possible to make granite equally impervious without the polish.—Yours obediently,

THE COMPILER OF "TESSERÆ."

## CHURCH BUILDING AND RESTORATION.

**Horwich.**—Plans have just been prepared by Mr. Thomas E. Smith, architect, Wood Street, Bolton, for a new school-church for the Roman Catholics of Horwich, in the stead of the small building now used in Gorton Fold. The style to be adopted is plain Gothic, and the new building will be of red brick, with stone and blue brick dressings. It is estimated that accommodation will be provided for 350 persons.

**Tilehurst.**—The dedication-stone of the church of St. George has been laid. The church, which is to replace the present temporary iron structure, is of Early English style, built of brick, with stone facings, and will at present consist of only a nave and one aisle, accommodating 375 persons. The architect is Mr. S. Gambier Parry, of South Kensington, and the contractor Mr. J. Partlo, Tilehurst.

**Bolton.**—The Wesleyan Chapel, Bridge Street, Bolton, erected in 1803, has undergone a thorough renovation, the interior having been entirely renewed. New floors have been put in, the ground floor raised, and the gallery lowered. A vestibule has been formed at the front, and three entrance doors opening into same, a central door having been formed to be used in cold weather for inlet only, to prevent cold draughts. The old chancel has been added to minister's vestry. Mr. T. Ormrod, of Bolton, is the architect, and Mr. W. Tounson, of Bolton, the contractor for the principal work. The total expenditure will be about 3,500*l.*

## NEW BUILDINGS.

**Edinburgh Industrial Schools.**—The directors of the Edinburgh Industrial Schools have decided to combine their schools and dormitories in one large building, the plans for which, by Mr. Sydney Mitchell, have now been completed and approved. Within the building are provided houses for the superintendent and for the assistant superintendent. To the right of the principal entrance are the two school-rooms, communicating with the court by a door having a porch, and also communicating with a wide and well-lighted corridor, which runs across the building. Close to the principal entrance are a waiting-room and the superintendent's office. Further along the corridor are the matron's room, sewing-room, and

cutting-room. In a projection or wing, which is reached from the corridor by a passage between the matron's room and the sewing-room, is the sick-room. Beyond the sewing-room are the dining-room of the officials and the cook's room, and in a wing is the general dining-hall for the boys, which is directly connected with the kitchen, so as to facilitate the serving of food. The play-room is situated in a wing projecting into the court, and is entered from the centre of the corridor. At either end of the corridor are the lavatories, separated from it by glazed arcades. The workshops, boiler-house, laundry offices, coal and wood stores, &c., are all ranged round a spacious court, and are in every respect completely equipped. The first floor contains six dormitories, two for 35 boys, giving 600 cubic feet to each; two for 31 boys, giving 600 cubic feet to each; and two for 9 boys, giving 550 cubic feet to each. The boys' bath-rooms are placed close to the dormitories, but care is taken to prevent steam passing from them into the dormitories. An infectious diseases hospital is provided. The dining-hall, school-room, play-room, dormitories, lavatories, and corridors are warmed by hot water, and the sick-room and infectious diseases hospital are warmed by open fires. Cross ventilation through windows has been provided for in the dining-hall, school-rooms, play-rooms, dormitories, sick-room, and infectious diseases hospital.

## GENERAL.

**The National Gallery** has been enriched by the addition of fourteen new pictures. It receives this generous gift under the will of the late Mrs. Elizabeth Vaughan.

**M. Lockroy**, having declined the office of Under Secretary for Fine Arts in the French Ministry, the appointment has been accepted by M. Edmund Turquet.

**The Incorporated Society of British Artists** have elected Mr. T. C. Gotch and Mr. James S. Hill as members.

**Mr. James Jackson**, of Wyvenhoe Hall, has accepted the office of treasurer to the proposed School of Art for Colchester.

**An Art Treasures Museum** is proposed to be formed for Folkestone, and steps are being taken for holding an art exhibition.

**An Industrial and Fine Arts Exhibition** has been opened at Bath. It will remain open for a month.

**M. Laureys**, the professor of architecture, in Brussels, has been nominated a chevalier of the Order of Leopold.

**A Statue** of the late Lord O'Hagan is to be erected in a suitable place in Dublin. The sculptor has not yet been selected.

**A Public Hall** has been erected in Hatfield by the Marquis of Salisbury. It is in the Queen Anne style, of red brick, with moulded terra-cotta ornaments. A portion has been fitted up as a restaurant, while another part is a Conservative club. There are two reading rooms and a billiard room, with a hall for entertainments. The building cost 2,000*l.*, and has been built from plans by Mr. S. W. Shillito, of Hatfield.

**The Annual Exhibition of Ecclesiastical Art**, in connection with the Church Congress, will be held this year in the Esplanade Hotel, Southsea.

**A Committee** is being formed in Berlin for organising an exhibition of national industry, which it is proposed to hold in 1888, in a building to be erected in the plains beyond the Treplow Park.

**Mr. J. J. O'Callaghan** has offered a prize of 5*l.* to the carver of the best panel and capital, which will be sent to the Artisans' Exhibition, Dublin.

**Messrs. Smith & Brodric**, of Hull, have been successful in the competition for the new dispensary and cottage hospital at Beverley.

**The new Hotel de Ville**, in Zurich, has been completed. Although the utmost simplicity characterises the design the work has cost 350,000 francs. A new system of heating has been introduced from which much is anticipated. The inventors are MM. Bechum and Post, of Westphalia.

**A Meeting** of the Association of Municipal and Sanitary Engineers and Surveyors will be held at Burnley on April 25.

**The Essex Archæological Society** have decided to conduct a systematic and thorough excavation of the Roman villa at Alresford.

**The Contractors for the Lochty Waterworks** on Tuesday put in a claim, before the St. Andrew's Commissioners of Police, for compensation for the abandonment of the works, amounting to 4,220*l.* 15*s.* 2*d.*

**Eight Dwellings** in course of construction in Sixty-second Street, New York, being insecurely put together, fell on Monday while efforts were being made to strengthen their foundations. Twenty-four workmen were overwhelmed in the ruins. Rescuing parties laboured through the night, and succeeded in bringing out twenty men, all of whom were injured.

**Messrs. Eck, Callow & Co.**, electric engineers, have removed from Dean Street, Holborn, to Prudential Works, Greville Street, at the rear of the Prudential Life Assurance Company.

A Business Supplement

# The Contract Reporter.

to The Architect.

LONDON, APRIL 18, 1885.

## COUNTY SURVEYOR.

AT the meeting of the Suffolk County Magistrates on Tuesday at Bury St. Edmunds, with reference to the duties and salary of the county surveyor proposed to be appointed, the Finance Committee recommended that the surveyor be required to superintend all county bridges and approaches repairable by the county, to inspect county buildings and bridges once a year, to prepare plans and estimates for buildings and repairs, and to discharge the ordinary duties of a surveyor. The committee recommend that the salary be 120*l.* per annum, including traveling expenses, and an allowance of four per cent. upon any outlay exceeding 500*l.* on the whole sum expended in any particular case, where plans are prepared and the work superintended by him under the direction of the Court. The committee also suggested that the Court empower them to advertise for candidates. The report of the committee was adopted, it having been stated that many of the bridges had got into a bad state for the want of a surveyor.

## ABERDEEN BREAKWATER.

THE harbour engineer, after visiting the sea works at Newcastle, Sunderland, and Dublin, has made a report regarding the maintenance of the South Breakwater, and describing the means that had been successfully used at the ports he had visited to protect the piers from the action of the sea. To protect the South Breakwater, he proposed to level the foundation in front of the hole at the middle of the breakwater with a diving-bell to a level of 7 feet below low water of spring tides, to deposit a block of about 250 tons weight to form a head to the apron, and to deposit several smaller blocks on the landward side to complete the apron. The large block would be formed in the graving dock and floated by a barge to its site at the breakwater. It would be made hollow, the sea face lined with granite ashlar, and the inner sides and bottom built of brick in Portland cement, the interior to be filled with concrete, composed of heavy materials, after its deposit. He estimated the cost of the proposed blocks at 650*l.* The question of calling in a consulting engineer is under consideration.

## CANADIAN PACIFIC RAILWAY.

AN interesting diagram has been issued by the Canadian Government, illustrating the progress made with the construction of the Canadian Pacific Railway up to January 31 last. It shows the portion of the line graded, the miles of track laid, and the total distance completed on that date. Since then considerable progress has been made; only about forty miles remain to be completed on the section to the north of Lake Superior, and the work in the Rocky Mountains is so far advanced that it is expected that the railway will be in operation from Montreal to the Pacific coast in the

coming autumn. The rapid construction of the railway has proved very useful to the Government in connection with the disturbances in the North-West Territories, and will be an important factor in the prompt suppression of the outbreak. Troops have been conveyed over the line from Eastern Canada to Qu'Appelle, 320 miles west of Winnipeg. The railway, especially when finished to British Columbia, will be of considerable importance to the Empire, apart altogether from the effect it must have upon the commercial and agricultural development of the Dominion.

## BURGLAR AND FIRE ALARM.

AT the meeting of the Royal Scottish Society of Arts, on Monday, Mr. Wilkins, fire-master, Edinburgh, read a paper on "A Burglar and Fire Alarm." The communication, he said, was divided into three parts—(1) on an apparatus which would convey an alarm of burglary or fire to the inmates of any building where the apparatus might be fitted up, to the constable on the beat, and to the public in the locality; (2) on an apparatus which, if connected to street fire alarms, would have a tendency to prevent malicious persons tampering with them and giving false alarms; and (3) on the construction of the alarm. The alarm, he said, would consist of one or more bells, supported on a metal bracket—one bell being placed on each side, and the other in the centre immediately above. The hammer for striking each bell would be attached to steel levers, and kept in position by means of metal forked eyes, jointed in such a manner as to allow them to move upwards and downwards when put in motion. A revolving shaft would insure a separate ringing of the bells, and the alarm would be fastened upon a metal plate or wooden board, to which might be attached one or more cannons or pistols for making a loud report. The alarm might be attached to and worked in conjunction with the street fire alarm, so that the alarm would be communicated to the building and the fire station simultaneously. If the system recommended were adopted, it would give an alarm to the constables and the public which could be heard on a quiet night half a mile away. The alarm could be connected to windows and doors, and could be regulated so as to ring for a number of minutes, and, in the event of fire breaking out and burning the cord, the alarm would instantly be set in motion.

## THE TIMBER TRADE.

THE evidence of Mr. Wylie, an accountant in the compensation case of Messrs. Sommerville & Co., of Greenock, against the South-Western Railway Company, indicates the condition of the timber trade for ten years. Mr. Wylie said that he had gone over Messrs. Sommerville's books, and distinguished what the gains and losses were in the buying, selling, and sawing of timber from the year 1875 to 1884.

In 1875 there was a loss of 4,045*l.* 10*s.* 7*d.* on timber, and a gain on sawmilling of 4,471*l.* 6*s.* 3*d.*, giving a net profit for the year of 425*l.* 15*s.* 8*d.* In 1876 there was a profit on timber of 1,050*l.* 13*s.* 11*d.*, and on sawmilling of 2,331*l.* 5*s.* 6*d.*, making a net profit of 3,381*l.* 19*s.* 5*d.* In 1877 there was a loss on timber of 179*l.* 7*s.* 9*d.*, and a profit on sawmilling of 1,925*l.* 3*s.* 11*d.*, or a net profit of 1,746*l.* 2*s.* 11*d.* In 1878 there was a loss on timber of 4,661*l.* 7*s.*, and a gain on sawmilling of 249*l.* 1*s.* 9*d.*, or a net loss of 4,411*l.* 7*s.* 10*d.* In 1879 the loss on timber was 7,069*l.* 7*s.* 11*d.*, and on sawmilling a profit of 1,067*l.* 16*s.* 5*d.*, giving a net loss of 6,062*l.* 11*s.* 6*d.* In 1880 there was a profit on timber of 11,704*l.* 7*s.* 1*d.*, and a profit on sawmilling of 1,111*l.* 5*s.* 9*d.*, or a net profit of 12,815*l.* 12*s.* 10*d.* In 1881 there was a profit on timber of 4,363*l.* 17*s.*, and on sawmilling 1,146*l.* 5*s.* 11*d.*, or a net profit of 5,510*l.* 2*s.* 11*d.* In 1882 there was a profit on timber of 1,050*l.* 4*s.* 3*d.*, and on sawmilling 638*l.* 5*s.* 8*d.*, or a net profit of 1,687*l.* 9*s.* 11*d.* In 1883 there was a loss on timber of 1,067*l.* 15*s.* 11*d.*, and a profit on sawmilling of 1,862*l.* 7*s.* 8*d.*, showing a net profit of 794*l.* 11*s.* 9*d.* In 1884 there was a loss on timber of 902*l.* 4*s.* 11*d.*, and a profit on sawmilling of 292*l.* 6*s.* 8*d.*, making a net loss of 609*l.* 18*s.* 3*d.* For the ten years ending 1882 he found an average combined profit of 2,652*l.* 12*s.* 2*d.*; and for seven years ending 1882 he found an average combined profit of 2,238*l.* 6*s.* 10*d.*

## DISPOSAL OF REFUSE.

ON Wednesday evening, two papers dealing with the disposal of sewage and town refuse were read at the Society of Arts. The first, by Dr. Thomas Hawksley, related to the abolition of water carriage in the removal of effete organic matter from towns. The second paper, read by Dr. B. W. Richardson, had reference to the removal of refuse independently of sewage. This he comprised under the heads of house refuse, trade refuse, market refuse, street sweepings, condemned food, slaughter-house offal, and stable refuse; and, quoting the authority of Colonel Haywood, Engineer to the City of London, he said that refuse in the City, under the first four heads, alone amounted to about 61,230 cartloads per annum. The more rapidly the refuse was removed the better for the health of the community, and it appeared that in towns where there was quick removal there was less disease—a fact which showed that these agencies had an effect, indirect at all events, upon health. Everything connected with this removal, except perhaps in the City, was exceedingly bad in London and most large towns; but this should not be the case, seeing that a profit arose from it. The means adopted for removing house and trade refuse in the City might be taken as an example for other towns in England; but in the case of seaside places he recommended a system of floating barges such as those in use on the Tyne. He condemned the common system of contracts, and insisted that the parish authorities should themselves undertake the removal of refuse.

## COMPETITIONS OPEN.

**BOOTLE.**—May 1.—Plans and Specifications are invited for the proposed Erection of Public Baths. Mr. J. Alexander, Borough Surveyor Bootle.

**WHITCHURCH.**—May 9.—Designs are requested for a Small Cottage Hospital. Major Lee, Whitchurch.

## CONTRACTS OPEN.

**ACTON.**—April 22.—For Building Houses and Stabling, South Acton Estate. Mr. C. Nicholson Lailey, C.E., Surveyor, Ellesmere, Uxbridge Road, Acton, W.

**ATHERSTONE.**—April 20.—For Alterations, Rectory, &c., Congregational Church. Messrs. Ingall & Hughes, Architects, Temple Row West, Birmingham.

**AUCHMILL.**—April 18.—For Alterations to Noel House. Mr. W. Davidson, Architect, Ellon.

**BALTINGLASS.**—April 28.—For Building Dispensary, Residence, &c., at Rathvilly. Mr. H. R. Newton, C.E., 202 Great Brunswick Street, Dublin.

**BANBURY.**—April 21.—For Building Warehouse at the back of Central Premises of Co-operative Society, Broad Street, Banbury.

**BATLEY.**—April 23.—For Enlargement of Blenheim House. Mr. W. Hanstock, Architect, Branch Road, Batley.

**BATLEY CARE.**—April 20.—For Building House and Shop. Mr. J. T. Law, Architect, 64 Commercial Street, Batley.

**BELFAST.**—April 25.—For Building Shops and Dwelling-houses. Mr. Henry Seaver, B.E., Architect, 35 Royal Avenue, Belfast.

**BELMONT.**—For Building Six Small Houses. Messrs. E. S. & H. Boosey, Architects, 3 Langham Place, Regent Street, W.

**BIRKENHEAD.**—April 20.—For Building Foundations for Band Stand in Park. Mr. T. C. Thornburn, C.E., Borough Surveyor, 35 and 36 Hamilton Square, Birkenhead.

**BIRMINGHAM.**—April 20.—For Laying Wood Paving (5,000 to 6,000 square yards) in Corporation Street. Mr. Wm. Till, Borough Surveyor, Council House, Birmingham.

**BLAINA.**—April 27.—For Building English Congregational Chapel and Schoolroom attached. Mr. J. Thomas, Architect, Glannant, West Cross, Swansea.

**BOGTHORN.**—April 18.—For Rebuilding Two Dwelling-houses. Mr. John Judson, Architect, Bogthorn, near Keighley.

**BOLDON COLLIERY.**—For Building Christian Lay Church. Mr. J. Shields, Architect, Blackett's Buildings, Sunderland.

**BURNLEY.**—May 13.—For Erection of Municipal Buildings, Police Courts, and Public Baths. Mr. H. Holtom, Architect, Bond Street, Dewsbury.

**BURTON-ON-TRENT.**—April 21.—For Construction of Earthenware Sewer (600 yards). Mr. E. Clavey, Borough Surveyor, Municipal Offices, Horninglow Street, Burton-on-Trent.

**CARLISLE.**—April 21.—For Building Boundary Wall, Entrance Gateway, &c., Roadway Bridge, and Abutments for Footbridges, Diversion of Fairy Beck, &c. Mr. Isaac Cartmell, Clerk to the Burial Board, Town Hall, Carlisle.

**CHELSEA.**—For Pulling Down Three Houses and Shops and Clearing Site. Apply, 177 Fulham Road.

**CHELSEA.**—April 23.—For Repaving the Carriageway and Portions of Footways of the Suspension Bridge. The Engineer of the Metropolitan Board of Works, Spring Gardens, S.W.

**CHESTHILL.**—April 20.—For Additions and Alterations to Invervar Lodge and Steading. Mr. John Hamilton, Chesthill, Fortingal, N.B.

**CHIPPENHAM.**—April 24.—For Building Mission Chapel, Lowden. Rev. Canon Rich, The Vicarage, Chippenham.

**CLAPHAM.**—April 21.—For Roads and Sewers, Chatto's Estate. Mr. W. Newton Dunn, Surveyor, 1 and 2 Bucklersbury, E.C.

**CLAYTON HEIGHTS.**—April 25.—For Building Villa Residence, Stabling, and Out-offices. Mr. John Drake, Architect, Winterbank, Queensbury.

**CORK.**—April 22.—For Construction of a Timber Wharf (265 feet long) at Penrose Quay. The Engineer, 10 Lapp's Quay, Cork.

**COVENTRY.**—April 27.—For Laying Sewer, Leicester Road. Mr. E. J. Purnell, C.E., City Surveyor, St. Mary's Hall, Coventry.

**DERBY.**—April 24.—For Extensive Additions and Alterations to the Railway Servants' Orphanage Buildings, Ashbourne Road. Mr. Thomas Hall, Secretary, Railway Servants' Orphanage, Ashbourne Road, Derby.

Established 1820.]

INTERNATIONAL HEALTH

3 Silver and 4 Bronze Medals

HENRY CONOLLY.

LIMITED,  
MANUFACTURING SANITARY ENGINEERS,

Call the attention of Architects, Surveyors, and Builders to their Closets, the advantages of which will be readily seen by the accompanying Illustration.

THE "SAFETY" VALVE WATER-CLOSET,

WITH

Conolly's Reversible Trap (Patent No. 3,754).

This drawing illustrates an improvement in the trap of a Closet, which admits of the outlet being placed in any position to suit the soil-pipe. This object is attained by means of a collar, which is similar in shape to that of an ordinary Valve-Closet. The base of the collar being round is flanged A; this is attached to a corresponding flange B, formed on the end of Trap by means of screw bolts, and from the drawing it will be seen that the outlet can be fixed in any position. It is obvious that this system can be adopted in every case where a separate Trap is employed.

The "Safety" Valve Water-Closet, like the "Nestor" as regards the Basin, is made with a cast lead trap above the floor line. The Trap is constructed so that the water-line is within 1½ in. of the seating of the Closet; therefore it will be seen if there become any defect in the indiarubber seating, the trap still remains sealed; by this means the necessity of a ventilating pipe is also dispensed with, also the old system of having a weepin pipe from the supply to the Lead Trap fixed in the box of Closet, there being no space for the generation of gases. The overflow arm is also protected from the possibility of soil corroding the edge of pipe, as the clack is made to open against it.

CAN BE SEEN IN ACTION IN NEW SANITARY SHOW-ROOM.

53 & 55 Hampstead Road, 169 & 171 Drummond Street.  
WAREHOUSES—TOLMERS SQUARE, N.W.

[Telephone No. 3,525.]

EXHIBITION, 1884.

Awarded for Sanitary Appliances.

**GREENOCK.**—April 27.—For Supply of Two Sample Hydraulic Travelling Cranes (3 tons and 1½ ton), &c. Mr. W. R. Kinipple, C.E., 17 West Blackhall Street, Greenock.

## VENETIAN ENAMEL MOSAIC FOR MURAL DECORATION.

Mosaic Works conducted on the same principle as in Venice and Rome by

**A. CAPPELLO,**  
472 KING'S ROAD, CHELSEA, LONDON, S.W.

Established in 1880.

15 YEARS IN ENGLAND WITH DR. SALVIATI.

The above Factory is established in London for the purpose of making the Venetian Enamel Mosaic Work an English trade, and to reduce the cost to half the price that has been hitherto charged abroad or by the London agents.

See "Building News," Oct. 12, 1883, in reference to the Mosaic Pictures for the new Church of the Brompton Oratory, executed by this Establishment.

Gold Enamel Mosaic Work at 15s. per sq. ft.  
Venetian Enamel Mosaic Figure Work at 20s. per sq. ft., including expenses of Fixing.

## MOSAIC PAVEMENTS.

TO  
ARCHITECTS, BUILDERS,  
AND  
CONTRACTORS.

## STEEL CUT NAILS!!

The modern and important discovery in the process of making Steel has so reduced the price, that Steel Cut Nails of the well-known "Mitre Brand" can now be supplied at only 1s. 6d. per cwt. more than the price of the ordinary Common Iron Cut Nails.

The Steel Cut Nails are far superior in quality and more uniform in size than any wrought or hand-made Nails yet produced, and being lighter in weight than ordinary Iron Cut Nails and free from rust, they are found cheaper in actual use than common Iron Cut Nails at 1s. 6d. per cwt. less.

These Steel Cut Nails are specially suited for Builders, Joiners, Coopers, Packing-Case Makers, &c., and a single trial is sufficient to convince any one of their superior quality and cheapness.

**PATENT WROUGHT STEEL NAILS.  
OVAL WIRE NAILS.**

BODIES.

The Sanitas Co., Limited, Bethnal Green, E.

## GRUNDY'S PATENT WARM-AIR VENTILATING FIRE GRATE.

The novelty, superiority, and advantage of this patent consist in the heating surface being greater than any other Fire-grate introduced to the public. It is very simple in construction, and is made in the form of a Stove, the back of which is semicircular in shape, with gills behind and smoke-nozzle on top, all cast in one piece. The same can be attached to any design of a Register or Stove front. It is very suitable for schools, class-rooms, waiting-rooms, hospitals, offices, dormitories, and dwelling-houses, from the cottage to the mansion. Design and specification post free on application.

#### TESTIMONIALS.

"9 Victoria Chambers, Westminster, S.W.

June 10, 1884.

"SIR,—I have much pleasure in testifying to the efficiency of your patent Warm-Air Fire Grate. It has been very successful, and given every satisfaction where I have used it. Yours, &c.

"To Mr. Grundy. JAMES WEIR, F.R.I.B.A."

"Baptist Chapel, Clapham Common, London. Richard Webb, Pastor, 10 Grafton Square.

February 15, 1884.

"DEAR MR. GRUNDY,—I have pleasure in testifying to the excellency and efficiency of your patent Fire-Grate. It is the most charming invention for heating a large room I have ever known. I shall have pleasure in showing it to anyone who wish to have their schools or rooms pleasantly and efficiently heated."

From James Garry, Esq., Architect, West Hartlepool,  
July 1884.

"DEAR SIR,—I have very great pleasure in stating that the first stove, or patent warm-air ventilating fire grate, adopted by me in school at Seaton, and a second in a Cocoa Palace, have given such satisfaction that I now order eleven to be inserted in New Upper Grade Schools in course of erection at West Hartlepool. They are the most economical, efficient, and easily managed stove at present before the public.

"Mr. John Grundy."

From Hon. and Rev. G. G. C. Talbot, M.A., Withington, Cheltenham.

"DEAR SIR,—You will be gratified to hear that the school is completely warmed by your new grate. It is the most economical and efficient that I have ever seen.

"Mr. John Grundy."

From F. J. Yates, Esq., Architect, Birmingham.  
"The best of the kind I have seen. I shall have pleasure in securing their adoption whenever opportunity offers."

Apply to JOHN GRUNDY, 30 Duncan Terrace, City  
Road, London.

**LIBEL ON A BUILDER.**

AN action has been taken by Mr. Wisdom, a  
builder at Isleworth, against Miss Caroline  
Brown, who lives in that place, for slander.  
The slander complained of was in these words:  
—"Mr. Wisdom is not a fit man to be church-  
warden, for he could not attend to his own  
business, having been bankrupt two or three  
times," in consequence of which, as the plaintiff  
alleged, he was greatly injured in his credit and  
reputation as a builder, for which he claimed  
250*l.* as damages. The defendant denied the  
plaintiff's statement, and further stated that  
the words, if spoken, were not spoken of him in  
his business. Moreover, she stated that the  
plaintiff was a candidate for the public office  
of people's churchwarden, and the day of elec-  
tion was April 24, whereupon it was mentioned,  
rumoured, and reported in relation to his fitness  
for the office, and that the defendant spoke the

A NEW WORK, TREATING UPON

## VENTILATION, SANITATION, & HEATING.

ILLUSTRATED

WITH NUMEROUS PLATES.

BY ROBERT BOYLE,

VENTILATING, SANITARY, AND CONSULTING ENGINEER.

words in relation to his fitness for the office and not otherwise—that is to say, that he had failed in his own private business, and was therefore incapable of managing public business: and that the words were spoken by her as a voter at a public election, and on a public occasion, and in the public interest in reference to the plaintiff as a candidate for a public office *bonâ fide* and without malice, and in the belief that the words were true.

Mr. McIntyre for the plaintiff, in opening his case commented on the statement that the plaintiff was ever a bankrupt, though ten years ago, under pressure, his creditors had agreed to accept a composition from him. No doubt, he said, the defendant had uttered the words which the plaintiff denied. It appeared that the words were spoken on the occasion of the election, in which Miss Brown took an interest on behalf of the other candidate who succeeded, and that she spoke the words in the course of a canvass on his behalf, and spoke them to the wife of a voter in the heat of the election, and if she had apologised for them he would have been content. But when he had written to her remonstrating with her for language “unworthy of her as a lady or a Christian,” denying her statement, and asking for an apology, she took no notice of the letter and gave it no answer. After a month's delay—allowing her time to cool—his solicitor wrote to her asking her to withdraw the imputation in the local papers, but she ignored the letter altogether, and not until then did the plaintiff bring this action. He would be satisfied even now if she would withdraw the imputation.

Only one witness, a married woman, wife of a voter, was called to prove the speaking of the words to her by the defendant after asking her which way her husband would vote.

The plaintiff was called, and denied that he had ever been a bankrupt or had had bankruptcy proceedings against him, or taken proceedings in bankruptcy. In cross-examination he said that he had since been elected to a parish office, and, being asked as to any particular damage he had suffered, could not state any, but said in a general way that he thought he had not done

so much business since the election in question, and that some of his friends had not been quite so hearty towards him as before.

Mr. Lockwood, Q.C. (with Mr. T. Wheeler), for the defence, called the defendant, who stated that what she had said was spoken as to the election, and was what she had heard of the plaintiff, namely, that he was not likely to take care of parish affairs, as he had not taken good care of his own, and had, she thought, had something to do with his creditors. The defendant admitted, however, that her informant told her he had not failed, and that she herself said—“He has failed, has he?” And being pressed as to whether she had not used the word “bankrupt,” she only said she had not done so “to the best of her knowledge and belief.”

Lord Coleridge, at the close of the evidence on both sides, asked if it was really necessary that such a case should go to the jury. Had the plaintiff suffered any real injury?

Mr. McIntyre said the defendant had never retracted her statement.

Mr. Lockwood said she denied having made it, and he submitted that the occasion was privileged.

His Lordship held that the occasion was privileged, as it was during an election; but this, of course, was subject to the understood limitation that the words were spoken honestly and without malice, and he observed of the plaintiff's letter that it was in its terms rather provoking, as it charged the lady with telling untruths not creditable to her as a “lady or a Christian,” which, he said, was “rather strong” language.

Mr. Lockwood then addressed the jury for the defence, urging that his client had not spoken maliciously, and that she did not understand the difference between “failing” and being “bankrupt,” and merely used a wrong expression by mistake.

Mr. McIntyre submitted that the occasion was not privileged, but

His Lordship adhered to his opinion that it was, as it was the election of a churchwarden, a public officer.

Mr. McIntyre submitted that the words were

not privileged, as they were not spoken to a voter, but

His Lordship thought, as the defendant was a ratepayer, and so interested in the election, she was within the privilege.

Mr. McIntyre then addressed the jury on the part of the plaintiff, urging that the words had been spoken recklessly, without regard to their truth, and in the interest of the other candidate.

Lord Coleridge, in summing up the case to the jury, said it was not every hasty or ill-considered word which was the subject of an action, and even words *primâ facie* actionable were not so if spoken upon a privileged occasion, without malice. It was important not too much to narrow the bounds of privilege and fetter the freedom of speech. And he thought that privilege fairly applied to the occasion of an election to a public parochial office and to a communication made with reference to the election. And the occasion being privileged, then it was for the plaintiff to show that the words were spoken maliciously. Now, malice might be shown from the nature of the statement itself, and if, for instance, the defendant had said here that the plaintiff had been two or three times convicted of felony, there not being a shadow of pretext for such a statement, of course that would be malicious. In the present case it was not certainly like that. No doubt the statement made was not correct and not true in fact, but that was not enough to show malice, for the lady had, as she thought, some foundation for it in a statement made to herself as to the plaintiff having had “something to do with his creditors.” But her informant had told her that the plaintiff had not failed, and she could not positively deny that she had used the word “bankrupt.” The question, then, as to the right of action was whether the defendant had exceeded the bounds of privilege. But then came the question of damages. And as to this his lordship observed that the plaintiff's letter was not very conciliatory. And, on the whole, he really thought that after the excitement of an election the matter might well have rested, and it was hardly worth

## INTERNATIONAL HEALTH EXHIBITION: GOLD MEDAL

AWARDED.

### REDUCTION IN PRICE.

THE SUPERIORITY OF  
THE “HYGEIAN ROCK”

### BUILDING COMPOSITION

Over all other Material for rendering Walls Damp-proof and increasing their strength, is now universally acknowledged by the leading Architects, Engineers, and Contractors.

To meet the rapidly-increasing demand, the Patentee has recently made extensive additions to his Machinery and Plant, which enables him to effect

A REDUCTION OF OVER 25 PER CENT. IN THE PRICE.

WILLIAM WHITE,

Head Office and Works:—BELMONT ROAD, ABERGAVENNY.

The ONLY MEDAL for ROOFING TILES at the INTERNATIONAL HEALTH EXHIBITION, 1884, was awarded to

H. J. & C. MAJOR,

Late SEALY. Established upwards of 200 Years.

### THE PATENT TILE WORKS, BRIDGWATER.

Sole Manufacturers of Non-Porous ROOFING TILES, of various patterns, having C. Major's Patented Improvements, which, forming a double “rabbet” at the top, bottom, and sides of the Tiles, and avoiding cut or unprotected corners, make a secure lap that PREVENTS “WIND-STRIPPING” and ENTIRELY EXCLUDES DRIFTING RAIN AND SNOW.

Manufacturers of the Imperial Bath Scouring Bricks, Patent and other Roofing Tiles, Bakers' Oven Tiles, &c., &c.

A brick on flat and one on edge equal, suitable for Cottages, or where great economy is required, and is equal in strength to a 14-inch wall built with mortar only.

A wall built two half bricks on the flat is much stronger than an 18-inch wall built in the ordinary way.

while to have brought it into Court. Unfortunately, however, the plaintiff had demanded a public apology, and the defendant was unfortunately advised to take no notice of the letters, and so the parties resolved to "fight it out." Well, the occasion was privileged, and the words were privileged, unless they exceeded the occasion and were spoken recklessly, and if so, then there must be a verdict for the plaintiff, but for what damages?

The jury, after a few minutes' consideration, asked what amount would carry costs.

His Lordship said he did not interfere, and a farthing would carry costs as much as 1,000*l*.

The jury considered again, and asked if they could give a verdict for the plaintiff without damages.

His Lordship said no; they must, if they found for the plaintiff, find for some damages.

Thereupon the jury found for the plaintiff for 40*s*.

His Lordship then, on the application of the plaintiff's counsel, gave judgment for him for that amount.

### THE BUXTON SEWAGE WORKS.

THE new works for the treatment of the sewage of Buxton were opened on the 9th inst. They have been carried out on Dr. Thresh's system from plans by Mr. Joseph Hague, designed for the purpose of treating the town sewage by precipitation with iron water and lime, the iron water being conveyed by gravitation in specially-made earthenware tubes, with joints of jute, spun yarn, and cement, from a disused colliery at the foot of the Axe Edge hills. At a short distance from the "heading" entrance to the colliery, the iron water enters a brick receiving tank, constructed on the edge of the brook course nearest the colliery, and is conveyed across the brook in 9-inch metal pipes, supported on stone piers. A series of flushing chambers, supplied with penstocks, is introduced at suitable places along the route, which penstocks are furnished with convenient arrangements for charging the vans for street watering.

The liming and mixing-rooms are erected over the River Wye, supported by a stone semi-circular arch, the liming-room floor being on a level with the adjoining highway, and connected with the Board's sidings on the Midland Railway by an S curved tramway constructed with wrought-iron girders covered with creosote planking, supported by neat and substantially built rock-faced stone piers, with massive ashlar coigns, over which the lime required for precipitation purposes is conveyed from the sidings alluded to to the hopper entrance of the liming machine, which entrance is on a level with the floor, and connected with one of Messrs. Bowes, Scott, & Read's patent liming machines. A cistern of 800 gallons capacity receives the pulped lime from the machine, and is supplied with an agitating apparatus to keep the lime required during the night of a uniform and suitable consistency. Both the machine and agitating apparatus, &c., driven by an "over-shot" water wheel, 16 feet in diameter and 3 feet wide, the water for driving purposes being taken from the Wye, about 500 yards higher up the stream, and conveyed in large sanitary tubes.

Immediately outside the liming and machinery-rooms are constructed duplicate brick tanks, into which the main outlet sewer discharges. The tanks are furnished with wrought-iron screening waggons for the purpose of abstracting the solid and floating matter—estimated at 75 per cent. of the total sediment. The machinery for raising the waggons and lowering them into position consists of a "wench," secured to metal framing, supported on metal columns. After passing through the screening waggons the sewage runs through a brick conduit into a circular metal chamber, furnished with horizontal paddles, where the iron, lime, and sewage is thoroughly mixed. From here the sewage flows a distance of 50 yards through an earthenware conduit to the settling tanks, consisting of two sets so arranged as to work either singly or together. Those tanks are of convenient design, and are constructed of brick walls set in cement, with concrete bottoms, the walls being coped with neatly-

dressed local grit stone. The length of the tanks is 266 feet by 73 feet, and are capable of holding 400,000 gallons. The formation of the tank bottom is of original design, being 3 feet 6 inches deeper at the entrance than at the outlet, an arrangement which has fully met the object for which it was introduced, that is to retain the sludge at the inlet end of the tanks. The first of those tanks is formed with a brick division wall 6 feet from the inlet, supported on arches of a similar material, under which the sewage flows into the second tank and thence through the entire series of tanks, with a barely perceptible motion, to the effluent weir sill, which is of large ashlar tooled-dressed stone curved and bevelled on the front edge, over which the water flows on to the weir bottom, a depth of about 18 inches. The weir consists of courses of Lancashire stone dressed pitching set in cement, with a drip break joint of about  $\frac{3}{4}$  inch, which gives a very pleasing appearance to the effluent, and exercises upon it a powerful oxidising effect. From here the effluent is conducted in a serpentine course into the river, at a distance of about 30 yards below the tanks.

In the centre of the main division-wall at the inlet end of the tanks a triangular well is constructed for cleansing purposes, and is supplied with duplicate iron run-off cloughs so arranged as to remove what water remains owing to the extra depth of the tanks at that end. After the suspended matter has subsided, outside the entrance tank is a sludge-well, fitted with strong chain pump, driven by water power, and with cloughs so arranged as to remove the entire of the sludge. It should be stated that the bottom of this tank is formed with a longitudinal and transverse inclination, with the view of expediting the cleansing process, rendering it thorough and minimising manual labour.

Dr. Thresh, in explaining the system, said he was without faith in sewage farming, and considered that chemical precipitation is the better plan. The iron water from a disused mine removes the matter, and especially with addition of lime. But sewage could be treated much more easily, were every householder to see

## THE GREAT PROBLEM OF THE XIX<sup>TH</sup> CENTURY.

# VENTILATION WITHOUT DRAUGHT.

The hitherto unsolved problem of "Ventilation Without Draught" is to be seen practically illustrated at FREDERICK HENRY SMITH'S Test Room, No. 68, 52 Queen Victoria Street, E.C., Patentee of the Automatic Siphonic Aspirator System of Ventilation. A personal inspection invited.

*Extract from the Annual Report of the "French Hospital and Dispensary," issued 29th January, 1885.*

We have also to return our best thanks to Mr. Smith, who undertook gratuitously to repaint one of our wards and to apply a new system of ventilation of his own invention, which was very successful.

*Letter from David Urquhart, Assistant Engineer to Colonel Sir Francis Bolton, C.E.*

F. H. SMITH, ESQ., 52 QUEEN VICTORIA STREET, E.C.

4 THE SANCTUARY, S.W., LONDON: NOVEMBER 22nd, 1884.

In reply to your inquiry, I have much pleasure in certifying that your system of ventilation as applied to the "Island Room" of the illuminated fountains at the Health Exhibition reduced the temperature during the displays from about 110 deg. to about 70 deg., and thus enabled the men to perform their duties without inconvenience.—Yours faithfully,

DAVID URQUHART.

*Extract from the TIMES of March 14, 1885, page 7.*

"VENTILATION WITHOUT DRAUGHT.—This desideratum appears to be accomplished by a syphonic system devised by Mr. Frederick H. Smith, at whose offices, 52 Queen Victoria Street, London, we recently inspected the arrangement. The air supply is conducted into the apartment from the external atmosphere by means of air ducts, which terminate in distributing passages at the floor level. The exit for the vitiated air is placed in the ceiling, and consists of two tubes, a large and a small one, running parallel to each other between the floor joists in the case of rooms having others over them. In the case of rooms on top floors, or those having the roof directly over the ceiling, the tubes are placed concentrically, but the action and results are the same. The larger of the two tubes carries off the vitiated air, while the smaller one forms an induction tube for cold air, its outer extremity being open to the atmosphere. These two tubes or conduits are so connected that the passage of the heated air through the larger tube induces a current of cold air through the smaller one in a continuous stream. The result is a rapid clearing away of all deleterious gases and products of combustion as they accumulate, and the preservation of a pure atmosphere at an equable temperature in the apartment. In a small room at Mr. Smith's offices in which five large gas-jets were burning, the atmosphere was apparently quite innocuous at the level of about 7 feet, the temperature being about 60 deg. Fahr. At a higher level, however, and especially near to the ceiling, the temperature was high and the air greatly vitiated. It was demonstrated that this vitiated air was being drawn off through the exit tube, which acted as a powerful sucker. After turning off the gas-burners, and upon the temperature of the room generally becoming lowered and equalised, a feeble upward action was still maintained in the upcast tube, but there was no down-draught whatever. The system has already been applied to a church and other buildings with acknowledged success."

after the sanitation of his own dwelling. It is much cheaper to make even a liberal use of disinfecting powder than to pay doctors' bills, and every local board should be compelled to provide a supply of some simple and cheap disinfectant for anyone willing to fetch and use it. For use on slop stones and in water-closets a crude ground sulphate of alumina, which can be bought for about 50s. per ton, or say  $\frac{1}{4}$ d. per pound, mixed with a little carbolic acid, and perhaps lime, forms a splendid deodoriser and disinfectant, and sewage containing these disinfectants putrefies much less rapidly, and is more easily defecated.

### COLONIAL OPINION OF ENGLISH GOODS.

A SPEECH was delivered lately in Auckland by Sir Julius Vogel, the Colonial Treasurer and Postmaster-General, which suggests the prejudice against English manufactures abroad which other countries are exciting. He said:—I cannot help saying that under the Free Trade system of Great Britain there has been a great deal of scamped work and adulteration going on, and that buying in the cheapest market and supplying as cheaply as possible, manufacturers have been in the habit of not conscientiously supplying the best articles. It is only quite recently that by a happy accident—an iron axle falling to the ground and breaking while being unshipped—we were saved from sending forth death and destruction on our railways by using rotten axles sent out from Great Britain. I will give another case which will illustrate how little dependence you can place upon manufacturers under this system, and how much more conscientiously they work under protection when they feel that their whole reputation and success depend upon supplying good articles. I will tell you what happened recently. We sent home an order for certain locomotives after a type which we had running in the colony, and which were obtained from America. It was thought by the late Government

it was unpatriotic to go to America for goods, so the plans and specifications were sent home to England, and the weights and sizes given most exactly. When these locomotives were about finished the engineers telegraphed out that they were about to ship them, but that we had better order plant to strengthen our bridges and culverts, as it would not be safe to send the locomotives over them. Their idea was that we should make our railways to suit their engines. We telegraphed that we would do nothing of the kind—that we had limited the weight of the engines. They replied they could not be made according to the specifications we had supplied. But the answer to that was that we had them running in the colony, and we refused to take them. Well, this is what happened. We sent an order by telegraph to America for these engines, and such is the confidence we feel in the character of the material which will be supplied that we are prepared to take them without inspection there, whilst we cannot take the suspected ones from Great Britain. The Agent-General is in no way to blame in the matter. I have given you this history to show a reason why, even should we require to pay a little more, this work should be done in the colony. We have now called for tenders for the purpose of having locomotives made in the colony, and I trust it will lead to our being ultimately able to obtain all our locomotive plant on the spot.

### TRADE NOTES.

MESSRS. C. ISLER & Co., 88 Southwark Street, S.E., have secured the contract at the International Inventions Exhibition for fifteen of their improved patent registering turnstiles. They have also received orders from the War Office for a number of tube wells and pumps, with the necessary driving apparatus, for immediate delivery at Woolwich.

Two two-light stained-glass windows have just been placed in St. Mary's, Boltons, Kensington. The subjects represented are *Ruth and Boaz*, and *Christ Blessing Little Children*, respectively. These windows, as well as those

already in the church, are the work of Messrs. Mayer & Co., of Munich and London.

THE second of the churches bequeathed to Bolton by the Greenhalgh family is approaching completion. The present one, dedicated to the Saviour, will be opened early in July. Both are from the designs of Messrs. Paley & Austin, of Lancaster. The carvings and sculpture, together with the execution of the reredos and font, have been entrusted to Mr. Roddis, of Aston Road, Birmingham; and the stained-glass windows to Messrs. Burlison & Grylles, of London.

A STAINED-GLASS WINDOW has been placed in the south aisle of Winslow parish church by Dr. Newham, to the memory of his wife. It is in Early English style, the two principal lights portraying events in the life of St. Margaret, one showing her tending the lambs of her flock while diligently studying the Holy Scriptures; the other her martyrdom, and treading on the serpent of sin. In the tracery above is a portrait of Mrs. Newham. Messrs. Heaton, Butler & Baynes, of Garrick Street, Covent Garden, designed and carried it out.

THE interior of Highfield Church has been adorned with a reredos of glass mosaic, which was opened on Easter Day. The subject represented is *The Last Supper*. The work has been erected at the cost of 160*l.*, and was executed by Messrs. Powell & Sons, Whitefriars.

THE Marble Bath (swimming), Stanley Hall, Junction Road, N., has just been completed by Messrs. H. W. Wilkins & Sons, of Pentonville Road. This is a very handsome and substantial structure, and is not only one of the largest swimming-baths in London, but is the only one constructed of marble. The floor is paved with octagon-shaped slabs of Sicilian, decorated with squares of Rouge Fleurie. The sides are lined with Sicilian, divided into panels by Rouge Fleurie. The walk round the bath is also paved with marble. The superiority of this treatment to that of ordinary baths is very marked. The bath is 60 feet long, 30 feet broad, and has an average depth of 5 feet 6 inches. The whole of the marble work has been executed at a cost of less than 300*l.*

## NOTICE OF REMOVAL. BELLMAN'S PATENT GULLY.

*This Gully possesses the following advantages:—*

**Receives and disconnects one Rain-water Pipe and Three Waste Pipes.**

**Avoids all Splashing.**

**Ventilates the Pipes and Trap.**

**Forms Drain for Area or Surface.**

**Is easy of Access for Clearance.**

The ordinary P or S trap to be used in connection with Gully being in a separate piece, can be placed at any angle to meet the drain exactly, thus insuring a perfect joint, the Gully being fixed at right angles. This is a great advantage over other arrangements made with the trap in one piece.

*The Holes for Rain-water Pipes are made both Circular and Square and of various sizes.*

DESCRIPTIVE CIRCULAR ON APPLICATION.

**THIS GULLY IS HIGHLY RECOMMENDED by Authorities on Sanitary Matters.**

PRICE AT DEPOT:—EDWARD ST., DORSET SQUARE, N.W., 8s. 6d. each.

Also SINGLE GULLIES, for Sink Wastes only, price 3/9 each.

**BELLMAN & IVEY,**  
(OFFICE ONLY) 37 PICCADILLY, LONDON, W.

## GEORGE WOOLLISCROFT & SON,

Chesterton Tileries—North Staffordshire; Canal Tileries—Etruria, Stoke-on-Trent; Patent Tile Works—Hanley, Stoke-on-Trent.

MANUFACTURERS OF ALL KINDS OF

Blue Bricks, suitable for Railway and other purposes. Roof, Ridge, Garden, Encaustic, Glazed, Printed, Painted, Hearth, and other Tiles. Hydraulic Pressed Roof and Floor Tiles, suitable for Churches, Public and other Buildings, as they are lighter, harder, and will not absorb 25 per cent. of water, compared with the ordinary-made Plastic Tiles. Also Paving Bricks made from the above process, and from Rock Marl.

Depot—25A Cookridge Street, LEEDS. LONDON AGENCY—52 Finsbury Pavement, E.C.

SAMPLES AND PRICES ON APPLICATION FREE OF CHARGE.

## READING CASES FOR THE ARCHITECT.

Price Two Shillings.—Office: 175 Strand, London, W.C.

HIGHEST AWARD, the SILVER MEDAL,  
INTERNATIONAL SMOKE ABATEMENT  
EXHIBITION, SOUTH KENSINGTON,

NOV. 1881 to FEB. 1882.

Houses, Infirmarys, Hospitals, Schools, or  
any kind of Building

THOROUGHLY WARMED AND VENTILATED  
BY THE PATENT WARM-AIR GENERATING  
**MANCHESTER GRATES OR STOVES**

*By their use in ground-floor rooms of houses fires in bedrooms are not required.*

ROOMS RENDERED HEALTHY, COMFORTABLE, AND OF AN EQUABLE TEMPERATURE THROUGHOUT.  
Thousands in use in Great Britain, Ireland, and the Continent.

MADE IN EVERY SIZE AND DESIGN.

**SHORLAND'S PATENT MANCHESTER WARM-AIR BACKS**

Are made in every size, and are applicable to every description of Grate Front. No Grate complete without them. They convert the ordinary Open Fire Grate from being the most extravagant into the most economical method of warming. Rooms containing 50,000 cubic feet of space warmed by one Open Fireplace, a feat hitherto considered impossible. Hundreds of testimonials, alphabetically arranged, free on application.

THE PATENT COMBINATION OPEN FIREPLACE

**MANCHESTER STOVE,**

WITH ASCENDING OR DESCENDING SMOKE-FLUE.

Most suitable for rooms having no Fireplaces, such as churches, chapels, schools, halls, billiard-rooms, railway station waiting-rooms, asylums, hospitals, infirmaries. Fills the rooms with pure fresh air in the summer and warmed air in the winter. As in use at the Royal Observatory; Royal Naval College, Greenwich; Royal Naval Hospital, Greenwich; Royal Military Barracks, Eastney, Portsmouth; the Bank of England, and its branches at Manchester, Liverpool, Plymouth, Newcastle-on-Tyne, and Birmingham; and hospitals, banks, asylums, churches, &c., throughout the kingdom.

**VENTILATION BY MEANS OF VERTICAL TUBES,**

Which are made in every size and design, for supplying rooms of every description with Pure Air  
WITHOUT DRAUGHT.

These Vertical Tubes and Bends (which can be easily fixed by an ordinary workman) admit volumes of fresh air from the outside into rooms without draught. The air being delivered in a fountainlike form ascends to the ceiling, where it mingles with the air of the room, gradually falls, and eventually is carried away through the Extractors, Ventilator, or Fireplace.

THOUSANDS IN USE in buildings of every description from the cottage to the palace.

"All difficulties in connection with Ventilation solved by the use of Vertical Tubes" (Vide the TIMES), of which  
SHORLAND IS THE ORIGINATOR, PATENTEE, and MANUFACTURER.

NEW ILLUSTRATED PRICE LIST, WITH TESTIMONIALS, &c., FREE ON APPLICATION.

In use in palaces, gaols, churches, billiard-rooms, banks, workhouses, mansions, cottages, schools, police cells, Royal Observatory, asylums, H.M.'s Government offices, &c., &c.

**LEGAL NOTICE.**

SHORLAND'S PATENT GRATE BACK, No. 3,999, A.D. 1874; known as the "MANCHESTER GRATE."—In the action of Shillito and Others v. Larmuth & Co., 1884, S No. 4,408, on November 24, 1884, a PERPETUAL INJUNCTION was ordered, restraining the Defendants from Infringing SHORLAND'S PATENT, and ordering them to pay the Plaintiffs' costs of the action.

**E. H. SHORLAND, WARMING, SANITARY, & VENTILATING ENGINEER**

(LATE SHILLITO & SHORLAND),

CONTRACTOR TO HER MAJESTY'S GOVERNMENT,

**St. Gabriel's Works, Erskine Street, Manchester.**

# The Architect.

## THE WEEK.

THE sixty-second exhibition of the Society of British Artists, which was opened this week, is one of the best we remember. It suggests the influence which the latest French school is exercising. Many of the pictures would not be out of place in an exhibition of Impressionist works. Whether this is due to the adhesion of Mr. WHISTLER (who sends a full-length portrait of Señor SARASATE, with sundry other notes and arrangements) we need not discuss: it is sufficient to know that there are enough artists of the school to allow of harmony in Suffolk Street. Mr. WYKE BAYLISS is as loyal as ever to architecture, by rendering cathedral interiors in a way that deserves to be called poetic. Mr. F. BARNARD reveals the mental experience of JAMES I. after his first experience of RALEIGH'S tobacco. An opera ball in Paris is apparently inexhaustible in suggesting subjects, and Mr. DUNSMORE shows how HARLEQUIN watched over HAMLET. Mr. CATTERMOLLE has another imitation of Sir JOHN GILBERT; and Mr. DENBY SADLER has for once ceased to arrange his monks in a row, having only three of them. The president of the Society, Mr. BARR, has only one picture, which is good. Mr. NOBLE'S *Friends or Foes*—donkeys contemplating geese—is one of his best works. Mr. WOOLMER'S treatment of light appears more old-fashioned than ever. M. LESSORE'S *Dieppe Quay* and *Shoreham* are well deserving of attention.

THE Synod Hall in Dublin, which was erected at the cost of Mr. ROE, from the designs of the late Mr. STREET, is found to be unsatisfactory in one respect. There is great difficulty felt by the speakers making themselves heard, and in Ireland that means a sort of martyrdom. At last the defect has become unbearable, and on Tuesday the following resolution was adopted:—"That the Standing Committee be requested to take competent advice to improve the acoustics of the Synod Hall with wires, or panelling the walls, or otherwise, and to report to the next Synod, with estimates and their recommendations."

THE Council of the Social Science Association have, after due notice given, unanimously passed a resolution to the effect that, in prospect of a general election in the month of November, it is undesirable to hold a congress during the present year. They have, therefore, been reluctantly compelled to decline the invitation received from the city of Bath to meet there in the forthcoming autumn, but they have expressed a hope that the invitation from that city may be renewed for the year 1886. It has, however, been referred to the Executive Committee for consideration and report, whether a conference of a more limited nature should not be organised in London on some special subject or subjects to which, in view of the opening of a new Parliament, it may be considered desirable to call attention.

IN spite of all that has been done to bring the subject of ventilation before the public, a large class among them have very hazy notions about it. The Chief Inspector of Factories, in his last report, says:—"The due ventilation of a work-room is a matter by no means so easy of solution. The question crops up daily, and it is in no spirit of opposition that we are met with the observation, 'Tell me how I should ventilate this room? How am I to admit a sufficient quantity of fresh air without subjecting the hands to draughts of cold air, to which they will not submit?' It is greatly to be desired, were it possible, to formulate some suggestions for the better ventilation of workrooms. It is of course easy to say the exhausted air must be got rid of and fresh air be introduced, and this must be done, not by a rush of cold air, but by a gradual insensible introduction of pure air to supply the place of that which has been deprived of its health and life-giving properties." If people who buy the goods which are made in the factories asked the chief inspector to tell them how they were to become manufacturers, in spite of his simplicity and benevolence he

would naturally stare, and if mill-owners went to him for instructions as to how new factories were to be constructed, he would probably consider that they had become demented by the state of trade. Why, then, should Mr. REDGRAVE sympathise with the mill-owners when they wish to adopt the principle of "every man his own ventilating engineer," or propose that the country should go to the expense of issuing tablets of instructions to save wealthy men from expending a few pounds? The suggestions would be about as useful as a sheet of recipes for the guidance of a cotton-spinner. Grandmotherly care like that recommended by the inspector has become obsolete: ventilation and building are no more to be accomplished by formulating suggestions than the removal of depression in trade. Let Mr. REDGRAVE first try his formulæ on the last evil before applying them elsewhere.

THE Trustees of the Mason College, Birmingham, have decided to confer the title of "Associate of the Mason Science College" upon all who satisfy the following conditions:—(a) They shall have been systematic students of the college during three sessions—having attended during each of the first two sessions three courses, in separate sections of the college; and during the third session some course approved by the Academic Board. (No course to count unless consisting of at least two lectures weekly.) (b) They shall have obtained one of the following qualifications:—1. A University degree, taken with such distinctions as shall be deemed satisfactory to the Academic Board. 2. They shall have gained three first classes in separate sections in the college examinations, at the end of their first and second years; and at the end of the third year they shall have obtained a report that they have pursued a satisfactory course of study during that year from the professors whose classes they have attended. 3. The senior engineering diploma. The Associateship may be conferred for original research or distinguished merit upon past students of the college who have not fulfilled the above requirements. The Associateship may also be conferred, at the discretion of the Council, upon past members of the staff who have rendered special services to the college. For the present, Associates will have the privileges of the use of the library and free admission to lectures, and admission to the laboratories upon payment of a fee to cover expenses.

FOR a long time painters have been complaining of the photographers, who pirate their works without scruple. At length the tables have been turned, and the photographers profess to be victimised. The remarkable spectacle was exhibited at the Marylebone Police Court of a respectable artist appearing to answer two summonses for having copied a photograph of Miss ANDERSON, the actress. The model employed to sit for the figure gave evidence. Mr. COLLINSON, Mr. CAFFIERI, and other artists testified that there was no similarity between the picture and the photograph, and an actor of the Lyceum company said the picture was not a likeness. It was admitted that the photograph was used to give suggestions for the drapery; and, if the case were brought to the superior courts, we are inclined to doubt whether it would be affirmed that there can be a copyright in the dress of an actress who appears in public.

SOME statistics relating to Greece have been furnished to the Foreign Office. According to the last census "Greece Proper" possessed 335,159 private inhabited houses, 7,518 churches, and 11,341 buildings of various other classes, such as factories, schools, stores, public buildings, barracks, &c. In the ceded provinces of Thessaly and a portion of Epirus, there were 51,879 private inhabited houses, and 5,759 of other classes. In Greece and the Ionian Islands there are said to be 1,800 artists (or 34 per cent. of the population) which is too comprehensive a term to discuss. Art manufactures, with the exception of carpets, do not appear to flourish. The Tripolitza carpets are the best. It is suggested that it would be of advantage if some of the 3,000 students at the University were afforded the opportunity of turning their attention to practical studies of industries and mechanical arts. Manufactures will not flourish in Greece till technical education is fairly widespread.

## THE ENGLISH CATHEDRALS.

THE utility of the English cathedral system is not self-evident when a dignitary like the Archbishop of YORK is found taking a desponding view of the future. According to the newspaper report His Grace, in speaking at a public meeting at Sheffield on the Cathedrals Commission, told his auditors that "the cathedral, with its privileges and its natural jealousy of interference, refused to be moulded into conformity with modern ideas of activity. The Deans and Chapters were treated with indulgent consideration, partly on account of the magnificent fabrics of which they were trustees." It has been long a belief with many people that the conservation of the buildings is the most useful work of the cathedral bodies; and in 1840, when it was proposed to apply a large share of the revenues to parochial uses, a reservation was made in favour of the fabric funds. On that occasion Mr. GLADSTONE, with characteristic ingenuity, turned the proposal into an argument against the Bill, for, as he said, "if the necessity of supplying the spiritual needs of the country constrains us to alienate funds which are applicable to the maintenance of religion, much more are we compelled to abandon the costly work of maintaining the beauty of the cathedral buildings." That beauty, according to the speaker, was no more than an external type and symbol of the spiritual design with which they had been founded.

Whatever may be the shortcomings of Deans and Chapters, there is no doubt that they have not of late been negligent of structural maintenance. It will be said, perhaps, that it would have been better if they had been less zealous, for the costly improvements of WYATVILLE (to name only one restorer) have not been always blessings. But when it is found that out of the 24,000,000*l.* which have been expended between 1840 and 1874 on ecclesiastical buildings in England, a sum of over one million was laid out on cathedral restoration alone, it is plain that the Deans and Chapters have not been indifferent to their trust. That sum would be still higher if it included the cost of the works at Peterborough, Lichfield, and Gloucester and Bristol. It is more remarkable that since 1874 a sum of 470,205*l.* has been expended on cathedrals alone. The greater part may have been derived from restoration funds, but a fair proportion came from the Chapters.

St. Paul's, strange to say, is entitled to the first place. There is always something being done there, but few people will believe that within the last dozen years nearly 67,000*l.* have been paid for works. The improvement of the west area cost 15,625*l.*, nearly all of which was paid by the Corporation in return for the space that was added to the streets. In addition to the capitular fund derived from the lands at Tillingham, in Essex, the Ecclesiastical Commissioners contributed 30,000*l.* The works were rendered necessary by the extension of the services. A new chapel has been fitted up at the east end, the walls have been cleaned down, the pavements and steps have been repaired, the leadwork has been overhauled; an additional rail on the whispering gallery to protect sightseers is also an item of expense. Sanitary excitement is able to penetrate the walls of the chapter-houses, and a tribute to it is found in the new drains for the chapter-house and cathedral, which are now nearly completed.

In Chester, where renovation is in progress, the outlay was over 49,000*l.* This cathedral will illustrate the position of the authorities. There is no fabric fund, and the sum of 2,132*l.*, which was paid for restoring perishable stone, was only to be obtained by the Dean and Canons surrendering a part of their own incomes. The contributions to the restoration fund were mainly expended on the restoration of the choir. The Dean and Chapter of Lichfield have set apart 750*l.* a year since 1877 for repairs; the Ecclesiastical Commissioners gave 15,000*l.* towards the renewal of the west front, and a corresponding sum was subscribed. With the aid of rent and fines the Chapter were able to pay 43,000*l.* for the work on the west front, and in addition 7,000*l.* has been expended on the lady chapel, consistory court, &c. Costly as the work has been, yet the Dean points out that it forms no more than a small part of what remains to be executed for the renovation of the exterior of the cathedral.

Salisbury is another expensive cathedral. The Chapter

contributes a sum of about 334*l.* a year for repairs, but the restoration has cost in ten years 42,258*l.* The people in the diocese appear to be inspired by much generosity, for on a total outlay of 83,000*l.* the Ecclesiastical Commissioners' aid amounted to an eighth part. Durham is wealthy, and, with the exception of windows, which were gifts, was able to pay for restoration out of income or capital. Manchester is fortunate in finding wealthy benefactors. At the end of next year the expenditure on the cathedral is expected to reach 89,000*l.*, and, with the exception of 10,000*l.* from the Chapter and Ecclesiastical Commissioners, it represents subscriptions and gifts. Bristol is an instance of what can be done when there is an energetic head for the Chapter. Dean ELIOT was appointed in 1850. The cathedral was then truncated, the part set apart for worship being circumscribed and inconvenient. In the course of twelve years about 13,000*l.* was expended on the interior, of which sum more than one-half came from the Chapter. Then it was discovered that the west end was in a dangerous condition. The repairs cost 6,000*l.*, and the money was obtained by appropriating capital which had been assigned for the endowment of the Chapter. The public next undertook the construction of a nave, and additional subscriptions have been obtained for other purposes. In all, the expenditure has been 77,447*l.* But the two western towers still remain on paper, and the Dean says that the old part of the fabric will need an expenditure, even if only to insure its safety, of a larger sum than he ventures to name.

The latter statement might be taken to represent the apprehensions of many deans. In the neighbouring diocese of Gloucester the moiety of income belonging to the Chapter has fallen from 4,230*l.* to 3,265*l.*, while the expenses have increased by about 500*l.* a year. "Now, inasmuch as the residue of this moiety is the only means at present available for the maintenance of the fabric, it is evident," writes Dean LAW, "that nothing will be left for the purpose." The average expenditure on Gloucester Cathedral is about 1,000*l.* a year, and apparently the architect receives no commission for his services.

At present the Bishop appears to be allowed to enter the cathedral and sit on the throne which gives a title to the building, only by the courtesy of the Dean and Chapter. The Commissioners say they have "endeavoured to define and establish the relation in which the Bishop stands to the cathedral, and have made provision for assuring to him his legitimate position and influence." One of the devices proposed as a recognition of the Bishop's authority is the presentation of a report at the visitations upon the fabric of the building, which it is expected will "have the effect not only of securing for posterity an important record of all that has been done in the way of substantial repair and alteration, but also of drawing attention to what is being done and what may be required to be done from time to time for the welfare of the fabric." The responsibility for the conservation will, of course, still devolve upon the capitular authorities.

The question will be asked, Where are the funds to come from in cases like Gloucester and Bristol, where the fabric funds have fallen out of proportion to the cost of repairs? The Commissioners apprehend that when the subject is seriously discussed it may be found "that adequate provision cannot be made out of the property at present possessed by the capitular bodies," and in that contingency the only available resource appears to be the funds of the Ecclesiastical Commissioners. It is not reassuring to learn that "in the arrangements which have been made in recent times between the Ecclesiastical Commissioners and the capitular bodies, the requirements of the fabrics have not in all cases received the consideration which their importance would seem to have demanded." The only conclusion we can draw from this enigmatic statement is that the Commissioners have not been liberal in contributing to works, and, if so, it amounts almost to an indictment of that authority. For it is a serious matter to allow danger to arise which might have been avoided by a grant from the funds of the Commissioners. It is, we fear, too true that, owing to the modern notions of activity which prevail here and there, the cathedrals are not considered important in the eyes of general or local authorities, and if the bishops can put an end to the indifference, it is to be hoped they will be endowed with their new powers without loss of time.

## VIOLLET LE DUC.

[BY A CORRESPONDENT.]

IF I were inspired by a desire to be numbered amongst men of fame, or, in plain English, had a wish to be spoken about occasionally hereafter, I could hardly find a way more effectual to attain that end than by a book resembling one which MM. FOSSEY ET CIE. have lately published, containing drawings and designs by VIOLLET LE DUC. It is more pleasant to have charge of the erection of buildings than to make fine designs which are never to be handled by contractors and clerks of works, but when one seeks for future fame it is not safe to depend altogether on masonry. Some may say that this is like the reasoning with which the Duke in "Measure for Measure" tries to make CLAUDIO feel that life is not worth living. Even so; it may have its use. How many church-goers would be able to say who was the architect of the structure in which they worshipped on Sunday last? In modern times work-houses seem to be the only buildings on which it becomes customary to inscribe the architect's name, and then it depends on the size of the tablet and the number of guardians who have a wish that their names should go down to posterity. In the majority of cases there is no record that is enduring. But when a collection of plates executed in the best style is sent forth in honour of a man, it may be safely assumed that he cannot be forgotten. Books are not necessarily respected, despite of the Mohammedan injunction that every scrap which bears a letter should meet with reverence. The bindings as well as the pages may fall from their high estate. Plates, on the contrary, have a charmed life, with which even butter-men and office-keepers are afraid to meddle. They may undergo transformations, and find themselves in strange company in auction rooms, and be separated in scrap-books and albums or on screens; still, any state is preferable to dissolution in paper-mill.

M. RENAN lately said that if he cared for a future existence it would be in the form of a Prayer-book, and to be used only by ladies with small hands, wearing Paris gloves which were well cut. The dream is natural in a professor who is accustomed to the adulation of *salons*, and who is so charming a personage that the Princess IDA would relax the rules of Castle Adamant in his favour, and instal M. RENAN as the historian of the foundress of the Babylonian Wall, the Carian ARTEMESIA, and Eastern strong-minded ladies. As I am not accustomed to luxury, my ambition is different. If I have to exist in the bookish state let the metempsychosis be into something that resembles the "Compositions et Dessins" of VIOLLET LE DUC. I am not afraid of the ungloved hands of students, and it would be a flattery if I found myself worn down by fair use. That form of memorial would be better than any stone-cutter's work in a cemetery. I want no inscription appealing for kindly criticism on my designs, although they would be more likely to receive it when the profession felt that a ghost, however inconvenient, cannot enter into competitions. Even when the hardest things were said about them there would be a satisfaction in feeling (that is if books can feel) that one had still something to do with the art of building. Sometimes a friendly student might say, as he turned over the pages, "How well that man used to design! It is strange that his work could not be appreciated until it was too late." Then a critic of the right sort might come and point out that there was not a line of value in the designs. I can hear him saying, "The fellow had only a good memory and could draw well. He was an archæologist rather than an architect. I am inclined to doubt whether he was able to appreciate the difference between the style of one period and another; there is no muscularity about his figures, and I am confident he was colour blind." Perhaps the critic would turn to the pages in which I had attempted to express the joy that I had so often obtained from the curves I saw in common grass, and pointing to them in scorn, say, "You see he could not even select things that were of use in green-houses; he had a low sort of taste, and there is not a line to show that he understood Assyrian sculpture, or could draw the figure." Hard as all this might be, it keeps you from being forgotten, and what more could be done by the chisel of PHIDIAS?

I was set musing in this fantastic way by a discussion which I heard among several students in a public library, and it arose over the noble work which illustrates the art of VIOLLET LE DUC. It is needless to say that I was not serious when I fancied publishers bringing out a book of my designs at their own cost. If the works of COCKERELL, and ELMES, and STREET, and BURGESS, and DIGBY WYATT, and many more, have no attraction for enterprising firms, I could not expect them to care much for my humble efforts, nor have I a desire for my memory to outlive my life, if there must be a loss to any man and a transgression of the laws of political economy. An architect has but little chance of renown, alive or dead, in this country, and we must learn to plod along without it.

I think it may be safely said that, if VIOLLET LE DUC had been born on the west side of the Channel, we should have no memorial volume bearing his name to give delight for many years to come. But it is doubtful whether he might not have had a more successful career as an architect in this country than in France. Here he would have found himself in his right place. Born in 1814 (two years after WELBY PUGIN and three years after GILBERT SCOTT), he was in time to take his part in the Gothic Revival with profit as well as pleasure to himself. VIOLLET LE DUC was not a zealot like PUGIN, eager to make enemies of his supporters for love of the cause, or ambitious to acquire a character for costliness like BURGESS, and with so much learning he need have little fear of the censures of amateur ecclesiologists. He must have been popular here, having both tact and kindness of manner, and a large share of the commissions for Gothic houses and churches would have reached him.

In France, or rather in Paris, VIOLLET LE DUC was as much out of place as in place. All things considered, he was as safe a man as could be found to look after restorations, for he possessed a surprising knowledge of details, and had rather less eagerness than his contemporaries in France to make additions and alterations appear more striking than the remainder of the work. The closeness with which he was associated with Mediæval work was, however, enough to raise a prejudice against him among his countrymen. France has a sort of pride in its ancient buildings, although the establishment of the Historical Monuments Commission under MERIMÉE suggests the risks to which they were liable with local conservators. But there is nothing to show that the affection for Gothic ways goes much further. Long before the Revolution of 1789 the French intellect had separated itself from Mediævalism. If any one will turn to the dissertation on Classic and Gothic architecture which M. FELIBIEN penned, they will see with what an air of superiority the fine gentlemen of the Court and Academy under LOUIS XIV. looked down on Pointed work, and assured themselves that any beauty which might be found there came by accident. Gothic churches were Classicised as far as the money in hand would allow. There is now a more philosophical recognition of the position of the style in art history, but that is all.

In this century of ours, many things have arisen which have thrown a poetic halo around the darkest of the dark ages; but France might be considered to be proof against all glamour of the kind. For a moment it was supposed that an enchanter had arisen. The great romance of "Nôtre Dame" was enough to make men believe that Gothic times were about to be made attractive in France. In spite of the opportunities which that class of subjects offered to his genius, VICTOR HUGO abandoned them, and he alone was competent to follow WALTER SCOTT. The romances of DUMAS, in spite of their attractiveness, were not exactly of the kind that gives a character to an era. France was likewise without an influence like that of the High Church revival to aid in creating an affection for Gothic. To gratify Queen AMÉLIE a picture of a Mediæval character was painted by DELAROCHE, and a Gothic church was commenced in Paris which is known as Ste. Clotilde. The two spires did not, however, contrast over well with the neighbouring dome of the Invalides when seen from the Place de la Concorde, and no architectural revolution followed the completion of the building. No architect was more likely to obtain a commission for a Gothic church than VIOLLET LE DUC, if one of any importance existed; but I believe I am correct in saying that in all France there are no more than two village churches (I do not speak of the

restorations) which have been entirely carried out from his plans. Opportunities of designing new buildings were withheld from him, and then it was gravely said that he was deficient in creative power. In England we are familiar with judgments which are no less logical.

The life of VIOLLET LE DUC has not been written with the fulness which it merits, and a stranger in considering his character soon finds himself in a difficulty. That VIOLLET LE DUC wrote about Gothic architecture with more amplitude than any man of his age is undoubted; that the greater part of his life was devoted to that style is no less true; yet it is by no means clear that he believed it to be the one style as enthusiasts generally do. He was a Frenchman to the tips of his fingers, and in everything was abreast of his time. Is it not possible that occasionally at least he looked on Gothic with the eyes of his fellow-countrymen? In his lectures he maintains that to study Gothic work exclusively is to return towards barbarism, and he upholds the style which he had made his own, not for its beauty or pre-eminence, or suitability above all others, but simply because it represented freedom to his mind. Roman work he regarded as something which had to be carried out according to rule, while Greek and Gothic allowed liberty. A Greek artist would, according to VIOLLET LE DUC, recognise an ally in a Mediævalist, while the Roman would appear as an oppressor. He was an advocate for the introduction of new materials—iron, for example—in buildings, and on that account he gave the preference to Gothic. The acknowledgment that it was as impossible to create Gothic as Greek, because the times were different, and that all we could do was to imbue ourselves with the ancient spirit, was, however, enough to make people keep more closely to their Renaissance, for, with all its faults, it was familiar. If pasticcios were inevitable, they might as well be in that form as in any other.

A Frenchman must have felt that VIOLLET LE DUC, when exemplifying how well he was imbued with the Gothic spirit, was compelled to restrain his own power. He was, as it were, putting a drag on his genius. It is plain that he knew the difference between good and bad figure-work. No one could have spent so much time in drawing from cats without attaining competence to represent figures of many other kinds. Besides, it is plain from his sketches that VIOLLET-LE-DUC could draw the human figure fairly well, and he always introduces figures in connection with architecture in a way that shows the master-hand. In his sculpture, on the other hand, he disregards nature in order to give it a typical character. There is no doubt that the architect is generally right; but the necessity for the sacrifice is not apparent to a Frenchman who is disposed to be sceptical, unless it is unavoidable. If it be indispensable to have distorted figures with Gothic architecture, he prefers that his new church or other building should be in a style which can be completed in all its decoration without giving him pain. If the Italian is commonplace, he can find architects who will give another style, which allows of the best figure-work without apparent injury, and thus he builds expensive Trinités and Augustins, and is happy.

There was another and a more important cause to prevent Gothic from becoming a popular style in France. What makes the French language, which is so admirable for the expression of thoughts in prose, fail when it is the exponent of poetry, so that versification becomes mere *enfantillage*, as HEINE described the art? Is it not mainly from the excessive clearness which must reveal everything and leave nothing to the imagination? A "limed soul struggling to be free" expresses itself often in words or forms which become poetry and art, and a Gothic building—I speak, of course, of the genuine kind—is more delightful in proportion as we have to make out the thoughts of the builders. The men in those days did not wear their hearts upon their sleeves for daws to peck, and it is only by a loving study that we can understand their feelings. I remember reading somewhere a remark of VIOLLET LE DUC upon the joy which the old masons must have felt in making a copy in stone of a little flower or weed which they had picked up. For a brief space they had a possession which no cleric or layman could wrench from them, and so much liberty and sense of ownership was a luxury from its novelty. It struck me at the time as a revelation, for in this miniature of a learned archæologist the oppression

of the feudal age was depicted. Not only the floral ornament but other things are records in cypher of thoughts which, without that medium, must have been suppressed. The impediments may have had their use in helping to make every mason an artist, but to the average boulevardier the reproduction in a permanent form of details which were produced under those circumstances is more impolitic than the compilation of articles for an evening paper out of *lettres de cachet*.

Among his contemporaries there was no artist who possessed more of French precision and brightness than VIOLLET LE DUC. In his sketches he does not imitate the painful efforts of men who endeavour to be more true than photography, and he never fails to impart an air of life to his drawings. But his love of lines which seem to have been drawn by a needle, and of mechanical aids to insure accuracy when the lines were long or formed large curves, are evidence of his nationality. The illustrations in his works are distinguished from those in German and English books by their clearness. When pictorial effects are necessary care is taken to keep them subservient to the lines, and thus the character of every object is sufficiently expressed. The French love of system is no less apparent in everything he did. How he was able to accomplish so much appears always a mystery, and he could not get through his work, in spite of his unceasing industry, if it were not for his systematic division of each day's labours. He was as thrifty in the use of space as of time. VIOLLET LE DUC should be taken as a model for illustrators of books. His cuts could never be reduced without injury, for the space has been proportioned to the amount of the detail. He was so regardless of space that he must have been good in planning; but the French public cared as little for his houses as for his churches. Two or three houses in Paris, and one or two in the provinces, represent the patronage he secured in domestic work. It is the more remarkable when every one knew that VIOLLET LE DUC was as efficient in construction as in draughtsmanship. Workmen were always ready to become eloquent in his praise, and of all critics they are the hardest to convince about an architect's qualifications.

How an architect who was possessed of so much finesse could be attracted by a style that is marked by its *sauvagerie* is one of the mysteries of modern Paris. VIOLLET LE DUC was more akin to ancient Greeks than ancient Goths, and apparently he is never so much in his element as when drawing and describing Greek work. There was only one drawback apparently. He was very fond of leaves, and Gothic alone gave him ample opportunities for their introduction. The contours of his leaves, as of his mouldings, are, however, very often suggestive of Greece.

I have long thought that it was a misfortune for France, and for modern architecture, when VIOLLET LE DUC was enticed by DURAND to give him aid in his archaeological annals. I am not forgetting the splendid series of volumes which followed from that introduction, beginning with the sixteen volumes of the two dictionnaires, and ending with the "Compositions et Desseins" which I have now before me, and which are almost as creditable to the publishers as to the author. But I think it is better for an architect to build than to write, and the supposition that VIOLLET LE DUC was a Gothicism deprived him of the fortune which was his by right of genius. Men point to his chapter-house in Paris as a proof that he was not a good designer. I maintain that he was then hampered by difficulties, and, indeed, he was rarely able to do himself full justice. I think he would have been a great architect if he had followed out his early studies, but he sacrificed himself to archæology. May a happier lot be ours.

#### PETERBOROUGH CATHEDRAL.

THE following is the award of the Archbishop of Canterbury as arbitrator on the questions relating to the tower of Peterborough Cathedral, to which we referred last week:—

To the Dean and Chapter and other Members of the Restoration Committee of Peterborough Cathedral.

Very Reverend Sir, my Lords, and Gentlemen,—I have the honour to inform you that I duly received the two clearly-drawn "cases" explaining fully the different views taken within your

body as to the restoration of your cathedral tower, and with them abundant illustrations in the way of drawings and photographs; that I inspected the architectural remains, that I have had the advantage of a special interview with your representatives and with Mr. Pearson, and that I have given my most earnest consideration to the important questions referred to me by you.

Two questions are raised in the cases, viz. :—

I. The relation of the Chapter to the whole committee, and

II. The choice between two proposals for the restoration of the tower.

1. To the former of these my attention was properly directed in an emphatic way by the representatives on both sides, and I shall be pardoned if I venture to say that a true understanding on this head appears to me more important, if possible, to the restoration of the cathedral than the decision on the tower alone, because the constitution of the committee affects, and must indeed govern, the whole of your great undertaking for many years to come.

The committee consists of fifty or more members not appointed (I understand) on any systematic scheme. The Dean and residentiary Canons are naturally *ex officio* members of it. Its decisions are by majorities of members able to attend on each occasion. The Canons claim to control every decision, and state that they have originated every proposal and formed a decision on each step (until the proposal about the tower) before it came to the committee.

They have "practically conceded a veto on every step" to the committee, but have "not contemplated divesting themselves of any of the rights or responsibilities relative to the cathedral fabric which are inherent in the Dean and Chapter," and "that the committee was formed for the purpose of obtaining funds."

It is pointed out that on this basis any three of the Canons acting together as forming the majority in the residentiary Chapter would in any difference have the entire control of all proceedings.

Further serious and grave difficulties would, it is inferred, flow from this position, and it is urged that the Canons have in reality divested themselves of important responsibilities by their contract with the builder, in which he engages to look only to the subscription fund for his remuneration.

My opinion is that such a constitution of the committee as is above described is absolutely hopeless as regards the successful execution of a great work. Every difference of opinion adhered to by such sections of the body as are supposed above would be insoluble except (as now) by an appeal to an external arbitrator.

The principle is as defective as the practice would be difficult. Among other "rights" the Chapter certainly have the right of associating with themselves, as advisers in a crisis of the fabric, their ablest and most willing supporters in the cost and labour of its restoration. This, according to analogy in such cases, they are presumed to have done in convoking so important a general committee as the present.

Their first action in conjunction with such a committee (which is obviously too large for frequent actual consultation) should have been to nominate an executive committee, who again should have named a small sub-committee to carry out details and watch the work.

This method has acted within my experience harmoniously and successfully at Truro and elsewhere.

As the only possible means of determining the first question submitted to me, and of providing a serviceable method of continuing the work without frequent difficulties, I advise the immediate formation of a committee on a sound basis with a clear understanding of its functions.

In order to make my meaning clear, I should assume the Dean and four canons to be *ex-officio* members of the executive committee, and should suggest that the Dean and Chapter should appoint four other members, and that the subscribers (or the general committee as representing them) should appoint eight more members. The Dean would be chairman.

Three of the members (not *ex officio*) might annually retire and be capable of reappointment.

This gives an acting or executive committee of seventeen, who would appoint a sub-committee of three on the spot to watch the work constantly, and to carry out details committed to them by the executive committee.

The general committee (which might then, perhaps, with advantage even enlarge itself) should meet once or twice a year to receive reports from the executive committee and to consider large operations and general principles.

I believe it is only in some such way as this that the Chapter could practically derive the full assistance which it should expect from the general committee called in to aid their great work.

2. The restoration of the tower.

I desire, first, to say that if the committee had been originally constituted in the manner now recommended, this question 2 would never have arisen to be arbitrated upon, but would have

been determined within the committee. The committee have in this instance, with much judgment, recognised that severance on which the canons had laid stress, but which they likewise have used with moderation in proposing arbitration.

Since I consider, however, that the committee ought always to have been so formed as to have rendered reference to me superfluous, and since I advise that it be immediately so constituted, the next step would suitably be that the executive committee should, upon its formation, resume the question of the tower into its own deliberation, and determine within itself, by its own powers, the course to be pursued.

Then the whole of the restoration would be carried out on one principle. It might be matter of regret hereafter that part had been done on external authority, and part by the representatives of the cathedral and the counties. Greater general satisfaction would be felt in a united work.

In the meantime, I am bound to place before you the decision which I have arrived at, and if the committee be not formed this judgment will stand as the decision of the arbitration. But if the general interests of this great work are consulted in the way which I think so necessary, by the formation of a committee, I beg to be allowed to waive in its favour the authority committed to me, and simply to place my opinion in their hands to be dealt with wholly, and only as they think best.

It is as follows :—

The original intention with which the restoration was begun was to replace in sound condition every portion of the tower and lantern which was in existence before architectural demolition began, and it was contemplated that at some time or other additions might be made to the lantern, whether upon some plan analogous to the old octagon or on some other. It followed that such strength should be given to the reconstruction as not to put such heightening out of the question. But the prospect was not treated as immediate. This is the plan specified in the contract which was made. One party to the discussion adheres to this plan still. This is one of the two schemes between which I am desired to make choice. I will call it plan A.

The other scheme, which I will call B, is really a residuum of other plans. It did not spring up of itself. It is what remains through successive changes of a proposal for a high Norman tower to be erected (or re-erected) from the ground upon two ancient Norman arches, and two others to be substituted for the Pointed arches east and west, with an upper stage of Decorated work, corresponding to the present lantern and following its main lines, but much heightened and embellished. Into the lower arcade of the tower, immediately above the great Norman arches, were to be worked the remnants which have been found of the original arcading, and the whole was, according to this proposal, to be crowned with a high spire.

The spire was to be 350 feet high, or 50 feet short of Salisbury; the tower on which it stood 224 feet high, 40 feet short of the central tower of Lincoln. The lantern to be open to the height of 172 feet from the pavement, 12 feet more than double the height of the church.

It has been urged on behalf of this first proposal that so commanding an object on the great eastern levels, visible even from the sea, and itself a triumph of architectural skill, would be worthy of the devotion and ambition of the great district of which the cathedral is the pride. If this be part of your object I believe it could scarcely be fulfilled in a more magnificent manner. I have long since paid a practical homage to the genius of Mr. Pearson, and I feel that this tower and spire would be worthy of him. This conception, however, appears to be something wholly separate and distinct from the objects with which the restoration of the failing pride and grace of the fabric was begun.

There have been three intermediate plans, each diminishing somewhat from its predecessor—viz., one plan of the spire with a lower tower, and two plans of towers without spires. The last of these three is known as "Mr. Pearson's modified plan," preserving the main characteristics of his former ones, but with the upper of the Norman storeys omitted.

Finally, adapted from this, came the "committee's modified plan," which has Mr. Pearson's partial assent. This is plan B.

It was necessary to acquaint myself with the successive proposals in order that I might understand how B originated as the last modification of what had gone before. But I have no further concern with any of those proposals. My duty now is absolutely limited to comparing plan A with plan B, and giving a judgment in favour of one as against the other.

I am accordingly to choose between

A, viz., the replacement of the Pointed arches of A.D. 1380 east and west of the crossing; above these the present Decorated lantern of that date, as it lately rode the four great roofs; with provision for a future superstructure, possibly an octagon, as anciently—and B, substitution of Norman arches for Pointed; above these a Norman storey, 15 feet to 18 feet high, working in the relics, which probably formed an arcade before A.D. 1380; above this the Decorated lantern, neces-

sarily remodelled to its new position, battlement, and high pinnacles.

This plan B is recommended by being the reproduction of a fragment of the great tower which preceded the Pointed work, to be reconstructed by help of (1) the remnant of the arcade, of which there exists one-third of the whole four sides, and of (2) the fragments of the great Norman arches—these amount to only four or five usable stones (valuable nevertheless as evidence); but the rebuilding of the now demolished south and north arches will set at liberty (since greater stones must be now used for the springers) enough to rebuild one arch, exclusive of its springers—that is, exclusive of 12 feet 6 inches on each side above the capitals. These entire remains, therefore, are not very large, though very interesting.

Three points in B remain to be considered :—

- (a) The abolition of the Pointed arches ;
- (b) The alterations of the lantern ;
- (c) The intermediate Norman storey.
- (a) Ought the Pointed arches to be abolished ?

In favour of abolition it is urged that they are less “fine and rich” than indeed are “poor and mean” in comparison with the Norman. But they are allowed to be good Decorated work, so that this criticism is only to be taken as a general disparagement of the Decorated style in comparison with the Norman.

Against abolition is the fact that they are the central point of the fourteenth-century remodelling of the whole church. They correspond to the west windows and the internal advanced arch before it, to the groining of the choir roof, to the Pointed labels so carefully inserted over every clerestory window (as well as over the side arches of the crossing), and lastly to the lantern itself, which they supported. With all these the Pointed arches form one sequence. If they are abolished on principle in favour of Norman, much else ought to be abolished throughout the church as fast as opportunities occur, and probably the lantern itself.

(b) The lantern, if suspended at a greater height, *i.e.* above the Norman arcade—would have to be singularly altered. It was specially designed to ride close down upon the roofs. Its windows would have to be altered in shape and in length, and the blind panelling between the windows, which was so arranged as to fit down above the gable, would be without meaning when lifted a space above it.

As to both (a) and (b), if it is argued that the “Pointed arches and lantern are gone already,” great care was to be used (and I believe has been) in so removing them that they could be used again. In any case the Norman tower and arches are much more “gone.” What is really lost is the north-east pier, so interestingly restored about 1380, and only now abolished in rebuilding.

(c) The Norman inserted storey. This could not be (for constructive reasons) less than 15 feet to 18 feet high. The narrow arcading could not be lengthened to that height without losing character. There will be then an interval between it and the lantern, which must either be blank or covered by a new overhanging Decorated gallery. This would have a constructive use also, but would contract the lantern by not less than 6 feet in each diameter.

To sum up.

B has the recommendations—

First, of recovering into its place the design of one of the stages of arcading, and of incorporating an existing remnant of it. This, as a mode of gaining height, is recommended by its faithfulness to the past.

Second, and of substituting copies (with some genuine fragments) of the earlier Norman arches in places of the actual past of the last five centuries. This is recommended on the ground of preference for the style, as well as of the pursuit of superior antiquity.

But B has the following disadvantages :—That

(1) As against the principle of faithfulness to the past, it obliterates the mechanical effort of 1380 and the chief features of the “Pointed” remodelling of the whole church about that time ; and

(2) Alters the design and adaptation of the lantern to its place.

(3) That it leaves a large space between the arcade and lantern to be either a blank or to be used to introduce a novel and most prominent addition.

(4) That it presents an assemblage of features never before in juxtaposition, partly copied and partly old ; the old altered in some characteristic points (lantern) to enable them to be fitted together, and the oldest portion appearing between the newest and that which belongs to the middle period.

The disadvantages of B seem to me rather to outweigh its advantages, and, balancing merits and demerits in the two plans (which is all that I have to do), I cannot but recommend

That the first plan A be adhered to as originally intended and provided for—*viz.*, of replacing in solid and durable work the form of the tower and arches which we received, providing

at the same time what may be necessary as preliminary as to heightening the tower, whether by octagon or otherwise.

And that the recovered fragments be fitted together, as well as they can, in some place where they may illustrate the antiquities of the church.

I must apologise for the length of these remarks, and will conclude simply by repeating :—

1. That in my judgment it is essential to form an executive committee, and that

2. When this is done their own first function should be to decide themselves about the restoration of the tower.

This opinion of mine on question 2 may then be regarded by them in whatever light may seem suitable, their appointment superseding the necessity for arbitration.

I have the honour to be, Very Reverend Sir, my Lords, and Gentlemen, your most faithful, obedient servant,

April 11.

EDW. CANTAU.

## ART IN IRELAND.

THE annual meeting of the Art Union of Ireland was held in Dublin on the 17th inst. Lord Powerscourt presided, and in addressing the members reviewed the progress of art during the year. His lordship said :—I have great pleasure in congratulating the Royal Hibernian Academy upon its prosperity, as shown by the report of the council for 1883-84. The sales of works of art appear to be increasing both in number and importance, and the general standard of merit in the students has been decidedly higher of late years. I observe with the greatest satisfaction that the receipts, including season-tickets, amounted last year to 766*l.* 1*s.* 8*d.*, being an increase on the year before of no less than 214*l.* 3*s.* 8*d.* This sign of public appreciation will, no doubt, continue as the quality of the works exhibited keep up to a high standard. The Academy has also adopted a most praiseworthy course in admitting free the pupils of various educational institutions. The exhibition has also, in common with the National Gallery in Merrion Square and the Science and Art Museum in Leinster House, been opened on some Sundays. This was, of course, intended for the benefit of the poor, but, curiously enough, and, as I think, unfairly, it has been taken advantage of by those who could well afford to assist the Academy by paying at the door on week-days, which certainly was not the intention of the governing body, and seems hardly a fair proceeding. I cannot pass to other subjects without referring to the progress being made by some of the students of the Academy. One of them, four of whose works are hung on these walls—three of them having been placed by the “hanging committee” on the line—a sufficient proof of the good opinion of the senior Academicians—has distinguished himself especially by being the first Irish student that ever gained the first place among the art scholars at Antwerp. In that school, one of the highest on the Continent, in the city of Reubens, one of our young native artists has won his spurs ; and I must congratulate him personally, and also this institution, on the fact of one of our alumni having received this mark of distinction at a place so celebrated, both in former times and at the present, for having turned out so many great painters. I hope that Mr. Moynan will return there, and continue to study the works of the prince of painters. Mr. Osborne, Mr. Kavanagh, Mr. Tisdall, Mr. Moran, Mr. Greene, Mr. Lodge, and Mr. Hill have also been benefiting by their Continental studies, and I am glad to see in their works, as well as those of other young aspirants, that correctness of drawing, as well as attention to tone of colouring, to which I took the liberty of referring here on former occasions, is taking the place on these walls of the crudity and want of care in the delineation of form which used to be prevalent. These evidences of study in the proper manipulation of the pencil and the brush are sure to bring golden fruit to the industrious students ; and the larger view of things in art which prevails in the Continental schools, by bracing the minds and increasing the technical knowledge of those who have the energy to go to learn in them, will, I am certain, enable our Irish artists to raise the standard of excellence here in rivalry with the paintings of any other lands. There is no reason why, with these advantages, Irishmen need despair of rising to the highest level in art, and commanding the picture markets at their own prices, as is done by painters of the first rank on the other side of the Channel. As I have often remarked before, real excellence cannot fail to be appreciated by wealthy amateurs, and I hope to see Irish pictures bringing great sums yet, of the modern school, at London sales, where the works of such Irishmen as Barrett, O'Connor, Patrick Nasmyth, and others always find a ready market. The latter painter's works have now reached a price there which puts him in the same category as the great Dutchmen, Jacob Ruysdael and Hobbema. I saw an exquisite little work of Nasmyth's sold last year at Christie's for nearly 400 guineas, being not more than a foot square, to go into the collection of Mr. Bingham Mildmay, to

hang in his house in Berkeley Square, London, in company with Hobbema, Vandewelde, and Van de Capella, and it holds its own with any of them. Now, as to other matters connected with art in Ireland. The Government purchased at the Fontaine sale in London last summer the reliquary of St. Lachteen, to which attention was first drawn by Sir William Gregory and myself. There was a formidable competitor against Ireland for this in the British Museum, but I am glad to say that the representations made induced that institution to forego its claim to the Government purchase, so that it has come to where it ought to be, in this country. It is now temporarily placed among the collections of similar objects in the Royal Irish Academy, pending the building of the new museum, the first stone of which has been happily inaugurated by His Royal Highness the Prince of Wales. This brings us at last to the actual commencement of the greatest work for the promotion of the arts and sciences which has ever been projected in Ireland. After long discussions and two competitions, we are, I hope, at last on the eve of the commencement in earnest of this most important undertaking; and although the delay has been great, I am sure that in consequence there has been more mature consideration, and we have, at all events, this great advantage, that whereas we had at first only the museum projected, the outcome of it now is that we shall have a complete design, embracing the great National Library and all the other concomitants of a perfect group of structures dedicated to the scientific and artistic interests of Ireland. Not only this, although the comprehensiveness of the scheme is now its happiest feature, but it has been proved by the result of the competitions that Irishmen are able to hold their own in rivalry with others, for I can say this, that of the five selected designs on the last occasion, three of them were by members of this Academy; and, moreover, they were all of such merit that it was not easy to come to a final decision. One thing is now certain, that this great set of buildings will be carried out in all its details under the superintendence of a distinguished Irish architect; and we must hope that Irish builders and Irish workmen, with as much as possible Irish materials, will do the rest. Thus the people of this city and country will erect with their own hands what will, I trust, be the most important engines of civilisation and improvement which this country will ever have possessed. Not only here, but also in London, has the management of this scheme been, curiously enough, in the hands of Irishmen, for the President of the Council on Education is no other than Lord Carlingford, who took the greatest interest in it, as I know from the communications which I have had with him on the subject. One Englishman there was who did, perhaps, more than all to forward it; but that Englishman has devoted so much of his life now to the service of this country—having had the whole government of this island on his shoulders for many years—that he must be getting pretty Irish himself by this time. He bore with the mistakes of the committee in the first competition, and now his attention to the subject is to be crowned with success.

## TESSERÆ.

Wilkie as an Academy Student.

B. R. HAYDON.

THEY all told me there was certainly something peculiar in this new student. Jackson said he drew too square; another said his style was vulgar. "What does Fuseli say?" said I. Fuseli said, "Dere is something in him." I was rather uneasy all night, for Jackson said he had done something from "Macbeth," which all agreed must be a picture in high art. The next day I went as usual, when, in about an hour after we were all drawing, in came David Wilkie. He was tall, pale, quiet, with a wonderful eye, short nose, and vulgar, humorous mouth, with a look of great piercing energy of investigation. In the course of the morning, he began behind me to get into some argument, in a whisper, of which he was always very fond; and after a little, I am proud to say, he got up and quietly looked over me. He then sat down, and I got up and looked over him. However, I am delighted to say, he moved first. The next day we got into a fierce dispute, in which neither gave in, and we went away and dined together. He used to dine at an ordinary in Poland Street, where a great many Frenchmen assembled. Here he got that old man with glasses, reading the paper to himself, in the *Village Politicians*. By the time the vacation commenced, the habit of dining together, drawing together, and arguing had generated a sort of necessity to be together, which insensibly grew upon us. When the Academy closed, Wilkie came up to me and said in the broadest Scotch, "Whar d'ye stay?" and invited me to breakfast. I went to No. 8 Norton Street, knocked at his ground-room door, and a voice said, "Come in." In I walked, and, to my utter astonishment, instead of a breakfast, there sat Sir David, *in puris naturalibus*, drawing himself in the glass! "Good heavens!" said I, "where am I to breakfast?" With-

out the slightest apology for this position, he replied, with the greatest simplicity, "It's copital practice, let me tell you—jist tak' a walk." I took my leave and walked till he was ready. At this first meeting he showed me his picture of *The Fair*. The colour was bad, but the groups exquisite. But I was so full of Raphael, I had a sort of contempt for a young man so devoting himself. The fact was, I did not know enough of art to see its great value. I had a very different opinion when I did.

Venice.

JOHN RUSKIN.

A city of marble, did I say? Nay, rather a golden city paved with emerald. For truly every pinnacle and turret gleamed or glowed, overlaid with gold or bossed with jasper. Beneath the unsullied sea drew in deep breathing, to and fro, its eddies of green wave. Deep-hearted, majestic, terrible as the sea, the men of Venice moved in sway of power and war; pure as her pillars of alabaster stood her mothers and maidens; from foot to brow all noble walked her knights. The low-bronzed gleaming of sea-rusted armour shot angrily under their blood-red mantle folds. Fearless, faithful, patient, impenetrable, implacable—every word a fate—sat her senate. In hope and honour, lulled by flowing of wave around their isles of sacred sand, each with his name written, and the cross graved at his side, lay her dead. A wonderful piece of world. Rather itself a world. It lay along the face of the waters no larger, as the captains saw it from their masts at evening, than a bar of sunset that could not pass away; but for its power it must have seemed to them as if they were sailing in the expanse of heaven, and this a great planet whose orient edge widened through ether. A world from which all ignoble care and petty thoughts were banished, with all the common and poor elements of life. No foulness nor tumult in those tremulous streets that filled or fell beneath the moon, but rippled music of majestic change or thrilling silence. No weak walls could rise above them; no low-roofed cottage or straw-built shed. Only the strength as of rock and the finished setting of stones most precious. And around them, far as the eye could reach, still the soft moving of stainless waters, proudly pure. As not the flower, so neither the thorn nor the thistle could grow in the glancing fields. Ethereal strength of Alps, dreaming, vanishing in high procession beyond the Torcellian shore: blue islands of Paduan hills poised in the golden west. Above, free winds and fiery clouds ranging at their will; brightness out of the north, and balm from the south, and the stars of the evening and morning clear in the limitless light of arched heaven and circling sea. Such was Giorgione's school, such Titian's home.

Restoration.

SIR G. G. SCOTT.

The more of the ancient material and the ancient surfaces remain and the less of new introduced, the more successful the restoration. If more cannot be saved, even one or two old bemossed stones in a window or cornice give value and truthfulness to the work; but when it is possible, all, or the great majority of the old stones should retain their untouched and unsmartened surface, and even where a wall is of necessity taken down, it is often possible, and would be always desirable to rebuild it stone for stone. There is an individual character even in the old ashlar which should not be overlooked, so much so, that in the absence of a single architectural feature the date can often be ascertained by it; this, too, should be observed and respected by the restorer. It is impossible to take too minute care in ascertaining the true original section or mouldings to be restored. Their fine "keels" and other smaller parts are often so nearly erased by weather or friction that they can hardly be distinguished, and sharp arrises are converted into rounded edges, so that without most careful observation of the moulding in every part its true form may not be discovered. Again, the sizes of the stones are an almost essential feature in arches, &c., and, if not attended to, the whole assumes a new and modern garb.

Teaching Drawing.

J. D. HARDING.

The prevalent method of teaching art, which merely places before the pupil something to be copied, exercises the faculty of imitation. This is exactly analogous to, and is attended by no better results than the bygone system of general education, now almost obsolete, wherein, whatever the subject, the pupil was merely called upon to commit a certain portion to memory. He who could deliver it from his tongue most correctly and most glibly, was voted the best scholar; few, if any, critical questions are asked. Under this *régime* every power save memory was hushed, no call was made on the intellectual faculties; talent was smothered or entombed, unless it had sufficient innate power to deliver itself from the somniferous or sepulchral load. Seeds were thinly scattered, and a harvest was altogether wanting. An attempt to teach art, by requiring the pupil patiently and minutely to copy the example set before

him, leads him as far away from its attainment as he would be led from the attainment of the Greek language were his tutor first to require an exact copy of the character of its alphabet, then of the words, and finally of a whole sentence. When able to do this without mistake, he would be as near to a knowledge of the Greek language as the like means would bring him to a knowledge of art.

#### Roman Rings.

E. WATERTON, F.S.A.

There is no nation with whose individual and personal history the finger-ring is so closely connected as the Roman. At first the Romans wore rings of iron, the gold ring being given to those senators only who were sent abroad as ambassadors; then it was adopted by the senators. Under the republic and the empire its use was regulated by laws. The ring of gold was the sign of equestrian rank, and the *jus annuli aurei* became the height of a Roman's ambition. Prætors and quæstors had the right of conferring the *jus annuli*. In later times the privilege was much abused, and in consequence the distinction became depreciated in public estimation. Then the use of rings became immoderate in number, and inconvenient in size. People no longer contented themselves with one ring; they sometimes wore rings on every finger, and even on every joint. One Charinus, according to Martial, wore daily a little matter of some sixty rings, that is, six to every finger, and what is more remarkable, he loved to sleep in them. They seem to have chosen, at pleasure, the devices or subjects for their rings—some wore the portraits of their ancestors, or the representation of some event connected with their personal history, or that of their family. Every man's signet was his ring; the impression of it was affixed to all official acts and deeds. Hence Cicero, writing to his brother Quintus, governor of Asia Minor, admonishes him to be careful in the use of his signet. The circumstance that not merely individuals but states had their seals, perhaps explains the great correspondence of many gems in rings with coin types. Roman rings occur of gold, of silver, of iron, of brass, of ivory, of lead, of amber, and of glass, and of one piece of stone.

#### Equestrian Statues.

THOMAS DE QUINCEY.

Till very lately, the etiquette of Europe was that none but royal persons could have equestrian statues. Lord Hopetoun, the reader will object, is allowed to have a horse in St. Andrew's Square, Edinburgh. True, but observe that he is not allowed to mount him. The first person, so far as I remember, that, not being royal, has in our island seated himself comfortably in the saddle, is the Duke of Wellington.

#### Pentelic Marble.

KARL FIEDELER.

It is a common remark that the marble of which the Temple of Theseus at Athens is built was covered by the ancients with a yellow varnish that had the appearance of gold. To this I reply that the Pentelic marble, which has preserved its polish for more than two thousand years, has without a dispute a yellowish glittering surface as though covered with fine gold leaf, and this may be seen in a very beautiful manner at sunset. But it proceeds only from the continued influence of the atmosphere, to which the stone is indebted for the treasured tint—a sign of its great antiquity. The same is observed on the Parthenon. Dodwell calls this yellow appearance a golden patina. The Pentelic marble of itself has a strong tinge of yellow, but the phenomenon above mentioned can only occur on a well-polished surface, and is therefore never seen on the rough fracture of the quarries.

#### The Elements of Design.

RICHARD REDGRAVE, R.A.

In considering the elements of style, it must be remembered that style is not merely governed by decoration, as is too often supposed, but originates in construction, to which decoration is only subsidiary, and the great eras of style have been noted by eras of changed construction. The moundlike temples of Egypt, the horizontal constructions of Greece, the arched vaultings of Rome, the vertical aspirings of Gothic buildings, contain as marked elements of style in their bare walls as when in their completed state they were covered with the rich decorative treatments peculiar to them. It will follow, first, that style implies some dominating influence reflecting the mind of the age in all its works, and therefore presumes a certain unity of character throughout. Secondly, that the primary elements of style are constructive; and that the design of a work must have regard to construction, and consequently to proper use of materials prior to the consideration of ornamental decoration. Thirdly, that as construction necessarily implies a purpose, utility must have the precedence of decoration. Fourthly, as construction necessitates a proper consideration of materials, and as each material has its own mode of manipulation and is wrought by separate and varied processes, design must be bad which

applies indiscriminately the same constructive forms or ornamental treatments to materials differing in their nature and application. Fifthly, that as the greater regulates the lesser, the building should determine the style, and all which it contains of furniture or decoration should conform to its characteristics, and thus there would be a proper conformity of style throughout, and a subordination of all the inferior objects to one another and to the whole.

#### Origin of "By-law."

PROFESSOR A. S. WILKINS.

Wherever you find places ending in *by*, as Whitby, Derby, Rugby, there you find Danes have been. *By* is the old Danish form for town or borough; and when you talk about "by-laws" you simply mean the borough laws as distinguished from the laws of the country. Of course now we use the phrase for the laws of a railway or a club, but originally "by-law" meant borough law as distinguishing it from the national law of the Great Parliament. Here you find lots of *bys*, and here lived the Danes; there you will find *tons*, and English folk settled there. In Lancashire you will find *bys*, as Crosby, Formby, in the West Derby Hundred, and so on. That means that the Danes, sailing round the country with their ships, came and settled just on the sea-coast, but could not get any further inland, because the English people drove them away.

#### Nielli and Engraving on Precious Metals.

J. WHITE.

The small silver or gold plates which require to be engraved are fastened, by means of a cement composed of resin and brickdust, upon a flat piece of wood, by which means a sufficient rest is obtained for the thumb of the engraver, which in this species of engraving sustains and steadies the hand. The burin or graver is grasped by all the fingers of the right hand, and, by a full pressure on the thumb, the artist is able to perform any operation with steadiness to the extent of a circular line of about six inches in length. The engraver, elevating his hand, has an entire control of the instrument, and works with equal certainty as upon a flat or convex surface. Indeed, a surface of much convexity is only safe in the hands of a skilful and experienced engraver, and no tyro would dare to attempt a bread-basket which is required to be engraved at the bottom, because the hand has to be elevated so as to place the graver almost upright, while the thumb solidly serves as a supporting pillar to the hand while the tool ploughs out the metal as the skill of the workman directs. The instruments generally used for this work are square, but are varied to different angles, and are termed the square graver, half lozenge and lozenge graver, the flat-scooper and the spit-sticker. The practice I have described is, generally speaking, as much unused, perhaps unknown, by those who are now called historical or landscape engravers, as the art of chasing is unknown to, or not practised by, silver engravers. I am entirely satisfied by the conviction which has been produced by knowledge and experience, that in this way and by this process did Maso de Finiguerra, and all the primitive goldsmiths, produce the impressions which are now denominated "Nielli," from the subsequent process of filling them with the substance described by Vasari and others.

#### English v. Flemish Bond.

GEORGE HOWELL.

The English workmen pay great attention to bond, and pride themselves upon its perfection. Many architects and clerks of works select old English bond for heavy buildings on account of its superior strength. I cannot, of course, deny that its strength might exceed that of the Flemish bond if carried out in all its integrity, but this I affirm, without fear of contradiction, that the Flemish bond is equal to every possible and impossible emergency. I defy any architect to point out any one instance of its failure to sustain, without fracture, any superincumbent weight or pressure ever brought to bear upon it. The reason of failure, when any such has taken place, is not the weakness of the style of bond, but the want of bond by snapping header after header, sometimes for whole courses, in order to save a few front bricks, whether red rubbers or malms. If the courses are laid regularly and fairly, the headers being properly and constantly placed their whole length in the wall, it cannot fail; I defy it to do so. Nevertheless, the old English bond should always be used in rough work inside and outside, as it is a little quicker in practice, and all the "bats" can thereby be used up with facility. And in this there is no fear of failure with regard to strength, as walls never split or separate in the centre; their fractures are generally due to the foundations, for a heavy pier will settle more than a light one, and hence it frequently happens that the fracture takes place through the arches of windows or doors. If I were asked whether the old English bond or style cannot be made to look well for front work, I would answer yes. But it will always look heavy and confused; it can never have the light appearance of Flemish bond.

ARCADIA (VENUS AND ADONIS).

THE admirers of PRUD'HON form two camps. According to the firm belief of one party he was the greatest of all the painters of *amorini*, surpassing RAPHAEL himself. And when we look at the delightful friezes made up of infantile actors and actresses, that belief appears to be well founded. There is nothing to suggest the infant phenomenon of the circus among his numerous figures, or the precocity that is seen in the gardens of Paris. In the other camp, PRUD'HON is venerated as a professor of high art, whose religious pictures and allegorical pieces are inspired by the spirit of the sixteenth century. M. SIROUY, in undertaking the translation of a work of the *Venus and Adonis* type, appears to have been attracted by the former belief. It is one of those idyllic pictures by PRUD'HON which QUATREMÈRE DE QUINCY described as a combination of the purity of antique contours with the grace and softness of CORREGGIO.

PIERRE PRUD'HON was not one of the fortunate painters. His father, who was only a working mason, died when PIERRE was an infant. He was homeless when the monks of Cluny took pity on him. The pictures on the walls of the convent impressed him so strongly that he was able to draw almost as early as he could read. He found a patron in the Bishop of MAÇON, by whose aid PRUD'HON was removed from Cluny and sent to a school of painting in Dijon, of which DEVOSGES was director. He married when he was only nineteen, and from that time until his death was unhappy. So many cases of the kind have occurred, it is not surprising that Sir JOSHUA told young FLAXMAN, when he heard of his marriage, that he might look upon himself as ruined.

PRUD'HON made his way to Paris in 1780—he was then in his twenty-second year—where he designed for engravers. He still continued to study. A prize was offered by his province for which he competed. It suggests the artist's generosity when we hear that finding a companion regretting his inability to complete his picture, PRUD'HON took up the canvas, and put so much of his own grace into the figures as to gain the prize for that work instead of for his own. According to the story, the rival was overcome by friendship of so antique a character, and declined to accept the prize. It was assigned to the rightful winner, and enabled him to travel to Rome.

PRUD'HON made a friend of CANOVA, who desired to keep him in Rome. But, after about seven years of studying and copying, he returned to Paris. It is nearly as difficult for an artist to succeed in France without the aid of friends or of cliquism as in England. PRUD'HON might have starved as a painter, and it was only by resuming his occupation of making designs for engravers and work of that class that he could find a living. If it be remembered that the tragic scenes of the Revolution were then being enacted in Paris, the graces and cupids of PRUD'HON become rather remarkable as the product of the time. Some of his designs were commended, but the city was not in keeping with his mind. PRUD'HON next sought patrons in the provinces as a portrait painter. He was fortunate in obtaining an introduction to FIRMIN DIDOT, the head of a family whose name is associated with the production of books that are remarkable for typography and illustration. Many of PRUD'HON's finest designs were produced for that printer. Through the friendship of M. FROCHOT, the Prefect of the Seine, he obtained a commission for a painting having for subject *Crime Pursued by Justice and Vengeance*, which was expected to strike terror into the souls of any criminals who found themselves in the court where it hung. This work, which is now in the Louvre, was carefully thought out, as may be seen from the drawings, in PRUD'HON's most finished style. But it is open to the objection of being partly real and partly ideal. The criminal appears to have been taken from one of the portrait busts of the Roman emperors.

A subject better adapted for a painter with so much of what the old critics used to term "correggiosity" was found in *Wisdom Guiding Truth*, which for a long time adorned a ceiling at St.-Cloud. Another work of the same class is the *Diana Imploring Jupiter*, in which the goddess seeks to be preserved from subjection to HYMEN. It forms a part

of the ceiling in the Salle Diane of the Louvre. Pictures of that class, in which goddesses, nymphs, and cupids had to appear, were best suited to his pencil.

Two works in a different style should be named. In 1816 a painting of *The Assumption*, for the chapel of the Tuileries, was ordered from PRUD'HON by the King. The price was 6,000 frs. But in 1843 a sketch for the work was sold to the late Marquis of HERTFORD for double that sum. It is now with five other works of the painter in Sir RICHARD WALLACE's splendid collection. A commission for a *Crucifixion* was afterwards given by the Minister of the Interior. It was intended to be placed in the cathedral of Metz. The work was destined to be his last, for PRUD'HON died in February 1823, three days after its completion.

COUNT DE CLARAC says that PRUD'HON looked on nature with the eyes of CORREGGIO, and was inspired by a similar ideal of beauty. The charm which his figures exhibit, the soft *abandon* of their attitudes, and the peculiar sweetness of their countenances, recall the Italian master. At the same time it must be acknowledged that PRUD'HON was not the equal of CORREGGIO as a colourist. He is too often cold, and is lavish in his violets and yellows. It is also objected that he was over fond of elegance, and that all his figures appear to belong to one family. PRUD'HON was a dreamer and a poet, and the whole of his pictures are suggestive of an ideal world into which, happily for himself, he was able to ascend. He and his followers are a sort of standing protest against modern realism in France, and the criticism which cavils with PRUD'HON is no less applicable to COROT.

## A LONDON MANSION IN FRANCIS I. RENAISSANCE.

WE publish this week a design of a London mansion, in French FRANCIS I. Renaissance. It is the author's belief that of all the styles of French architecture this is the most adaptable to English dwellings. The very laxity of the style, which is neither Classic nor Gothic, but a mixture of both, allows of the greatest freedom in meeting all the requirements and even caprices of private persons. On the other hand, it is a style born in purple, its first appearance being connected with the palaces of a king and the castles of a refined nobility, whereas Queen Anne and Old English timber-work have sprung from a humbler source—the farmhouse and the cottage.

Mr. LAWRENCE HARVEY, the author of this design, has studied architecture in the Ecole des Beaux-Arts, where the traditions of symmetrical planning prevail, and the effects of this training may be seen in the vistas of halls and staircase, which will no doubt form a striking feature of his building; but in all other parts there is the suppleness of an English plan where comfort and convenience alone seem to reign. The exterior, with its high-pitched roofs, its variety of cornices, balustrades, and carved work, may suggest the richness and dignity of the Early French Renaissance, and excite a desire to see many more buildings erected in so noble a style.

## THE O'CONNELL CHURCH, CAHIRCIVEEN.

WE publish two more of the drawings of the Memorial Church designed by Mr. G. C. ASHLIN, A.R.H.A. The perspective views appeared on March 28.

## MILLET AND MODERN ART.

THE second of two lectures on "Jean François Millet and Modern Art" was delivered by Professor Baldwin Brown at the Scottish Atelier Society's rooms on Saturday. It was said that the greatness of Millet was due to his grasp of the fundamental truths of art, which are the same in every age. There is no modern "royal road" to artistic achievement. All solid work in art, however modern in feeling it may be, must be done in accordance with the old principles which were illustrated most clearly in the best work of the seventeenth-century painters. On some of these painters he hoped to deliver some occasional lectures next winter. They possessed the secret of solid, unpretentious work, which had yet upon it the stamp of style and true artistic quality. This secret had been to a great extent lost in modern times, and the art of our day was liable to

fall into the commonplace, or, if it aimed at style, to become showy and theatrical. Going on to review the modern schools, he suggested that they might be marshalled in two divisions—those of the Teutonic peoples, and those which grouped themselves round Paris as their centre. The work of the former was quiet, that of the latter, though often brilliant, was restless and superficial. The British school occupied a place somewhat apart, through the absence in it of old artistic tradition. This was in part a benefit, as it secured freshness and variety in work, but in part a disadvantage. To the want of it was largely due the comparative failure of our painters in figure pieces on a monumental scale. The method of carrying out a large subject picture was far better understood in the Continental schools than here, through the continuity of tradition which some of them had maintained from Renaissance times. The old masters were more studied by young German artists than by our native students, and the good result of this study, in solidity of technique and an appearance of style, was shown in some of the works of the younger Munich school. In contrast to the quiet distinction of some portraits by F. A. Kaulbach, attention was called to the flimsy and commonplace work which appeared occasionally in places of honour at Burlington House, and reference was made to the evil effect upon some of our painters of becoming mixed up in the fashionable world. The modern French school was then briefly reviewed, and the chief kinds of work represented in it were illustrated by photographs. The landscape school, associated with the names of Rousseau and Jules Dupré, was traced back to the influence of works of Constable exhibited in Paris in 1824. Like Constable, these painters represented nature not in detail but in general effect. They were content with the subjects which lay nearest to them, but strove to make the very most of them through subtle rendering of tone and strength of handling. The prevailing fancy among French landscape painters of the day for large canvases was shown to be a departure from the better taste of Millet, Rousseau, and their associates. After a few words on the German school, the lecturer proceeded to his concluding remarks. Art, he said, is no mere exhibition of skill, but a serious function, which should make a demand upon the thought and feeling of the artist. He is the greatest artist who reads most deeply into nature, and gives out what he sees in forms of the highest and most permanent value. The painter who has the highest conception of what art ought to be will be most surely preserved from the danger of sinking into a worshipper of "Chic," or a mere drawing-room artist. Art would have the best chance of rising to higher things in a school which is strong enough to preserve throughout its independent, national character, but in which the artist accustoms himself to raise his ideas and solidify his practice by a reverent study of the lives and works of great artists, whether belonging to bygone ages or, like Millet, to our own generation.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS

THE tenth ordinary meeting of the Institute of Architects was held on Monday evening, Mr. Ewan Christian, president, in the chair. A list of nominations for membership was read.

Mr. ARTHUR CATES noticed that the list of men who had passed the examinations just read showed how much provincial men esteemed the advantages of the examinations. He hoped such an example would have weight with the young men in London, and bring them forward as candidates for membership increased in numbers and in merit.

The PRESIDENT hoped the young architects in the metropolis would duly attend to what Mr. Cates had said.

### Notes on Flint-work.

Mr. BAGGALLAY read a paper on this subject, with special reference to the county of Suffolk. As a student, he claimed indulgence for bringing forward the paper, which he should not have done except by request of Mr. White. The subject had been suggested by a visit to the picturesque town of Norwich, where he had examined twenty churches, all of them faced with flint-work. The greater number of buildings he had examined were, however, in Suffolk. The subject had often been alluded to, but, well known as it was, it never seemed to have been treated as exhaustively as it deserved, when it was considered that it was an English development of architecture. He argued against the idea that a sham or any untruth was involved because with flint-facing the wall was not of one material throughout. No one supposed from seeing a green meadow that the globe was made of grass, or that the bark of the silver birch was anything more than the covering of the tree, &c. His idea was to build the wall its proper thickness, and then to face it. The treatment would be used for monumental buildings, and not so much for domestic buildings, where it might be inconvenient on the score of cost, or for other reasons. Flint was one of the hardest and most enduring materials,

and if it could be worked with reasonable facility, it would beat, he thought, all other materials out of the field. The flints were described, and their use from simpler to more elaborate and decorative purposes in pattern, &c., remarked on, and "garotting" or filling up the interstices with splinters of flint alluded to. The round towers were among the earliest of flint construction, and the roughness of the work suggested to him that it might have been intended to finish them off with stucco. He thought that flints had first been used more as rubble, and the date of the work of the churches pointed to the fifteenth century as the time of a more elaborate work. The decorative character of the flint-work was then considered in detail, and instanced by examples quoted.

Mr. Baggallay concluded his paper by remarking that it was unnecessary to argue in favour of the occasional adoption in these days of cut-flint facing when the opportunity occurred, if only for the sake of a little variety. It was sufficient to point out that, if plenty of long banders, either of the flint itself or of stone, were used, the work was perfectly sound, and also that if it were once granted that facing was at all permissible, then for concrete walls what facing could be better than random-faced flint? The material would be the same, or very similar, only of a better kind, to that of the body of the wall, and the large quantity of mortar used would cause it to settle almost equally. In regard to the flush panelling, a great deal of which would necessarily be executed in gauged work, the list of prices he had collected showed that the cost would be prohibitive. From the point of view which he had attempted to show to be the right one—that surface architecture was not only no sham but the most sensible and artistic—it needed no other recommendation than its own intrinsic beauty for its revival. Apart from mere revival, which was, in truth, but a backward step, it was surely capable of development, or, at least, of affording a few suggestions for those who are desirous to carry art onwards. The most obvious of these was the substitution of other materials than the flint. Not to speak of gauged brickwork, which, treated in that way, would be at least as beautiful, there were varieties of marble at command, at prices certainly high, but not, in these days of cheap carriage, altogether prohibitive. And in what way could marble be more appropriately applied to buildings than in slabs, cut to a form which did not suggest joinery, or any other material, and tied in the body of the wall by the stone frame which surrounded it? for of course we should not be guilty of imitating the fourteenth century to the extent of making that too merely superficial. Then in a similar way decorative panels could be used, appropriate to the external decoration, like those of della Robbia. Was it quite impossible to sink the panels slightly and decorate them with frescoes? He would even dare to suggest that a modern building, decorated with well-designed tracery of the kind, executed in white marble, delicately moulded and the ground filled with mosaics, would rival in richness, and might easily be made to surpass in beauty, the gorgeous fronts of Siena and Orvieto cathedrals. Or a less extravagant proceeding would be to use or develop such banded work as that of Clyffe. The bands might be of a variety of materials, stone and flint, brick and flint, brick and terra-cotta, brick and faience, &c. And any one who knew the beautiful effects of the banded work of the various Italian buildings, would confess that it would be worth more than a mere trial. Probably some might be thinking that these were impracticable suggestions. There would be of course two difficulties in carrying them into practice—one to get even however short a distance out of the old grooves: and the other to find a public who would appreciate or pay for efforts to give them something worthy of the great, wealthy, and go-ahead nineteenth century. But difficulties should act as a spur to their efforts, and he hoped at least that the matter might receive consideration.

Mr. COLE A. ADAMS proposed a vote of thanks to Mr. Baggallay for his paper.

Mr. CHARLES BARRY, F.S.A., who seconded the vote of thanks, said the paper was on a subject which he thought had not received anything like extensive study on the part of the profession, partly from the want of demand, if he might venture to put it in that way, for the particular kind of architecture which the use of flint-work had illustrated. Mr. Baggallay had drawn attention to one of those particular studies and phases of the working part of the profession which deserved more study and attention than it received. The flint architecture of this country might well be made the subject of a future essay. He was open to correction, but his impression was that flint-work was a national phase of architectural development, and that, except in England, it was almost unknown, and therefore a matter which English architects should study particularly. Another point he would advert to was the peculiarity that flint architecture, at any rate in anything like the development referred to by Mr. Baggallay, existed only in the East of England; whereas chalk formations bearing flint strata were common to different parts of the country. In the county of Sussex there were examples of flint churches, but they had not received the same artistic treatment

as churches in the eastern counties. This was curious, and worth being inquired into. He thought the conclusion to be drawn was that there must have been some great object attained by the architecture of the fifteenth and sixteenth centuries in the use of flint. The greater study given to colour decoration at that period might explain that object. Economy would, he thought, not account for it, as the flush-panels, &c., were not at all economical. He, therefore, thought it must have been for the sake of colour. In the paper one point, somewhat foreign to the subject, was as to the decrying of English architecture for the comparative inattention shown in the smallness of the church entrances. He ventured to think this was far from being a defect, and that the unity and majesty of a well thought-out composition would be seriously interfered with by a different treatment. English architects acted quite properly when they avoided exaggerating any feature, whether door or window, so as to sacrifice unity as a whole.

Mr. WM. FAWCETT considered there was a great difficulty in former days in obtaining stone in Suffolk. As to sea-carriage, that county was practically more inland than Sussex. He said he could testify to there having been a great deal of colour, which was now lost.

Mr. L. W. RIDGE spoke of the round towers near Lewes, where money was always more or less short and stone scarce, though not so scarce as in the eastern counties. Consequently flint might have been used.

Mr. ASTON WEBB mentioned a house of Mr. Edis's at Brighton, as a very charming example of the legitimate use of flint work.

Mr. J. FOWLER, of Louth, attributed the use of flint, in the counties of Norfolk and Suffolk, to the enormous wealth of those counties, and to the desire to display that wealth to the glory of God. The district was, they knew, totally devoid of stone. As to flint works in Sussex, the chalk formations contained scarcely any flint. He only wished, for the sake of architecture, that this geological formation were more commonly to be found in the country.

The PRESIDENT considered a right explanation had been given by attributing flint work, as seen and used in East Anglia, to the wealth of that rich manufacturing district, for the carved woodwork equalled anything that was to be seen in the West of England. The President spoke of the extraordinary tenacity of flint work when properly constructed, and how, in a former generation, the rector of Cromer Church (possibly to avoid the expense of a new roof) had petitioned for leave to pull down the chancel because, as he alleged, it was likely to fall down. It was a most infamous act. The walls had to be destroyed by gunpowder to get them down. From an examination of the ruins he (the President) had been able to reconstruct the chancel, mentally, exactly in its original state, the remains, though broken up, being so perfect and so sharp in detail. Notwithstanding the small size, at the most moderate estimate a restoration would have cost 10,000*l*. A better material than flint for building could not be found. The work must, however, be done properly. It must be built slowly and only in the finest weather.

The vote of thanks having been awarded, Mr. Baggallay acknowledged the compliment, and the proceedings terminated.

## EDINBURGH ARCHITECTURAL ASSOCIATION.

THE members of this Association, to the number of 110, visited the Forth Bridge and Rosyth Castle on Saturday. The party arrived at North Queensferry about one o'clock in the afternoon, and took advantage of the opportunity afforded them of inspecting the Forth Bridge works on that side of the channel. At half-past three the excursionists left on board the steamer for Rosyth Castle, which is situated on the north side of the Forth, about two miles to the north-west of North Queensferry. On arriving in the bay opposite the castle, the party were landed by means of boats, and, after an inspection of the ruins had been made, Mr. James Gordon read a paper descriptive of the castle. The castle, he said, anciently belonged to a branch of the great family of Stewart, descended from James Stewart of Durisdeer, brother-german to Walter the Great Stewart of Scotland, father to Robert II., the first of the family who ascended the Scottish throne. Robert the First, Steward of Rosyth, was killed at Shrewsbury in 1409, and it might be assumed that the castle or keep was built prior to that date. The plan and construction of the keep also led to the conclusion that it must have been built in the end of the fourteenth or very early in the fifteenth century. Additions and alterations were made in 1561 and 1639. Sir Walter Scott, in "The Abbot," alluded to the castle, the lord of which, he said, discharged a culverin from the battlements at Lord Lindesay and his party who were on their way to Lochleven. Queen Mary, it was said, slept in the castle on the first night after her flight

from Lochleven when on her way to Glasgow. There was a tradition that the grandmother of Oliver Cromwell was a daughter of the laird of Rosyth, and was born in the castle, and that the Protector himself slept in it after the battles of Pitreavie and Inverkeithing, which were fought between the Royalists and Roundheads in 1651. The family of the Steward of Rosyth continued to flourish till about the beginning of last century, when, according to Sibbald, the last laird dying without issue, disposed the estate to a stranger, by whom it was sold to the Earl of Rosebery. It was now in possession of the Earl of Hopetoun. The original keep was L-shaped on plan, with a circular newel staircase, about 10 feet in diameter in the shorter arm, giving access to the various floors and to the battlements. It was divided in its height into three sections by two vaults. The lower section was further divided by a wooden floor, which was carried on stone corbels built into the walls, the vault over being of segmental form. The great hall entirely occupied the intermediate section, having a semicircular vault, and the top section was divided, as in the lowest, by a wooden floor which was carried on corbels. The roof must have been of wood construction, and was probably covered with shingles or slates. It was said that a causeway and drawbridge at one time connected the promontory on which the castle stands to the mainland. About a hundred yards to the east of the castle was a very interesting columbarium or pigeon-house. After photographs of the castle and party were taken, the homeward voyage was commenced, and after a smart run, the steamer sailing round Inchgarvie on the way, Leith was reached about seven o'clock.

## RICHARD ANSDELL, R.A.

THE death of Mr. Richard Ansdell, R.A., which occurred on Monday morning at his residence, Collingwood Tower, Farnborough, Hampshire, deprives Lancashire of one of the best-known of her artistic sons. He was born, says the *Manchester Guardian*, at Liverpool in 1815, and was educated at the Bluecoat School. His artistic instincts were early developed, and in place of devoting himself to commerce he turned his attention to animal painting. He was fortunate in having the encouragement and patronage of the Earl of Derby, whose love of zoological science was shown by the formation of the famous Knowsley Menagerie. From these animals Ansdell made numerous drawings, which were characterised by facility of execution and skill in seizing upon points of expression. He managed to give something of value even to commonplace subjects, and publishers were ready to engrave his paintings of coursing meetings and similar gatherings more satisfactory to the sporting public than to the lover of the picturesque. His largest achievement of this nature is a huge picture of a meeting of the British Agricultural Association, which includes portraits of about a century of bucolic notabilities. His early works were sent to the Exhibition of the Liverpool Academy, and attracted considerable approbation, in spite of some noticeable defects. There are six of his paintings in the gallery at Knowsley. In 1840 he made his first contribution to the Royal Academy, when *Grouse Shooting* and *A Galloway Farm* were exhibited. These were the property of the Marquis of Bute. Since then above a hundred of his pictures have appeared at the Royal Academy, and about thirty were exhibited at the now defunct British Institution. Amongst these we may name his *Death of Sir W. Lambton at the Battle of Marston Moor* (1842), and the *Battle of the Standard* (1848), both remarkable for the dramatic vigour of treatment. The last-named was immensely popular. It represents the famous episode at Waterloo, when Ewart, of the Scots Greys, bore away the colour of the Lancers. Ewart, who was as modest and unassuming as he was brave, passed the latter part of his life in this district. Some of Ansdell's paintings of animal life were as popular as those of Landseer, whose work they resembled in picturesque power. Typical of this class are *The Stag at Bay* (1856), and *The Combat* (1857).

Mr. Ansdell left Liverpool about 1845 for London, and in 1850 worked for a time in conjunction with Mr. Creswick. The result of this artistic co-operation was seen in *The South Downs* (1850), and *The Park* (1855). This method of partnership was not at all uncongenial to Ansdell, who produced *Feeding the Calves* (1855) in conjunction with Mr. Frith. The most important fact in his artistic career is that after his style might have been supposed to be fully formed, it was considerably modified by the influence of Mr. John Phillip, R.A., with whom he journeyed to Spain in 1856. This was the first of several artistic journeys to the sunny South, and observations of brighter skies and richer colours now took the place of the sterner colours and harsher outlines of these northern landscapes in which he had previously delighted. To these *cosas de Espana* belong *The Water Carrier* (1857), *The Flower Seller* (1859), and many others. But he never entirely abandoned the themes by which he had first gained his fame, as *The Lost Shepherd* (1860), and *Buy a Dog, Ma'am?* (1860)

show. His latest works include *Feeding the Goats in the Alhambra* (1871), *The Anxious Mother* (1875), *The Home of the Red Deer* (1877), and many others.

He was elected A.R.A. in 1861 and R.A. in 1870. Another notable distinction was the gold medal at the great Paris Exhibition of 1855 for his pictures of *The Wolf Slayer* and *Turning the Drove*. It is pleasant to think that Ansdell's merit was early recognised by Manchester, where he thrice received the Heywood gold medal—in 1846 for his *Returning from the Deer Stalking*, in 1847 for *The Chase*, and in 1848 for *The Duke of Montrose's Retreat*. *The Chase* is now the property of the Manchester Art Gallery.

Two only of his pictures appeared in the Art Treasures Exhibition of 1857, one a view of *Lytham Sandhills*, and the other *Returning from Labour*, in which the influence of Phillip was already seen. In 1863 he painted *The Hunted Slave*, a vigorous and almost sensational representation of a slave brought to bay and defending himself with an axe from his ferocious pursuers. This was his munificent contribution to the Lancashire Distress Fund, and it has now an appropriate place in the art gallery of his native town. When the Children's Hospital Bazaar was held in Manchester—probably the most successful ever organised—Ansdell contributed to it a characteristic painting of a dog, whose mute appeal was not the least effective of those addressed to the public on that occasion.

He was an etcher as well as a painter; and here we may quote the opinion of Mr. Hamerton, who says:—"Ansdell is a very accomplished artist, and when he does not think about etching at all, but simply sketches as he would with a finely pointed pen, he does work of a certain value, which value depends upon his knowledge of animals and not on his knowledge of etching, in which he does not appear to be especially interested." But he gives high praise to Ansdell's etching of *The Sentinel*, which he rightly calls a "magnificent study of a stag."

Ansdell had the English love of animals and of outdoor life. He had a keen appreciation of varied aspects of nature, and a genuine knowledge of the ways of dogs, and sheep, and stags, and other animals, that make by their intelligence and usefulness claims, not always recognised, upon the kindness and humanity of man. It may perhaps be said that if there had been no Landseer there would have been no Ansdell, and in a certain sense it is true; but Ansdell was no mere copyist, and with the exception of Landseer no English artist has so thoroughly understood and interpreted the lives and thoughts of "our poor relations" of the animal world.

## THE GLENGALL BUILDINGS.

ON Monday afternoon the Earl of Harrowby presided at the opening of a new Coffee Tavern and block of workmen's dwellings erected by the Messrs. Chubb, the safe and lock manufacturers, in connection with their works, Glengall Road, Old Kent Road. His lordship was supported by the Earl and Countess of Aberdeen, Sir R. A. Cross, M.P., Mr. A. M'Arthur, M.P., and other gentlemen. The buildings were lately illustrated and described in *The Architect*, and have been carried out from the designs of Mr. E. Hoole, F.R.I.B.A.

The Earl of Harrowby opened the proceedings by reading a letter from the Earl of Shaftesbury, who expressed regret at his inability to be present. Lord Harrowby said that the problem which Messrs. Chubb were attempting to solve was not merely to provide a place of recreation and entertainment for working-men, but, what was of greater importance, to "house them healthfully and comfortably." The difficulty was one which had been experienced not only in England but in France, where the social conditions were entirely different, and also in the United States, and in all countries it would have to be grappled with. He was satisfied that in this country our only hope of maintaining commercial superiority was in capital and labour, landlord and tenant, employer and employed, pulling together.

Sir R. A. Cross, M.P., said the question of housing the working classes was one to which for some years he had paid great attention, and though success as yet was only very partially attained, some 22,000 of the working classes in London were living in buildings put up under the operation of the Act with which his name was associated. Until the report of the Commission which had been sitting was issued, his mouth was closed as to their action; but he felt justified in complaining of the disgraceful neglect of the provisions of his own Act, and would suggest to the working classes that they might do much in their own interest by agitating and seeing that the best men were put on vestries and district boards to obtain for them pure water, light, air, and decent dwellings. A great deal might be done through the agency of the City Livery Companies, and he strongly advised these Corporations to take up the question of housing the working classes, while they had time, as a means of enlisting public sympathy in their favour. He fully endorsed

the dictum of their noble chairman that if we were to win in the race of competition with foreign nations, it could only be by unity of action between employers and employed, and between landlord and tenant. If all these classes remembered that union was strength we should not fail.

The Earl of Aberdeen said he regarded the proceedings of the day with peculiar interest and most hearty sympathy. All had been struck by the appearance of the building, and still more by the motive and object with which it had been erected. He was glad to think that, in spite of the numerous accounts of divergent feeling and disagreement between employers and employed, there was abundant proof that when employers manifested a real, practical, and hearty sympathy in the well-being of those in their employment their efforts were cordially reciprocated. His experience in regard to landlords and tenants had been that where there was a mutual desire to cultivate kindly relations such efforts were not without abundant and fruitful results. The present was a most opportune time for such aids to mental improvement as the building they were in proposed to furnish, for they were on the point of a large extension of the franchise, and every thoughtful working-man who was about to exercise the privilege of the vote would desire to qualify himself to the utmost for taking part in the government of the country. He sincerely hoped the inauguration of this work would set an example destined to be widely followed. He deeply regretted the absence of one distinguished man whose name stood among the list of guests (Earl Cairns), and whose loss they were all lamenting; and also that the statesman and philanthropist who was to have presided was prevented by illness from attending. He said statesman as well as philanthropist, for he knew of at least one Prime Minister who had desired the Earl of Shaftesbury to enter his Cabinet. His name was associated with forty years of persistent effort to improve the dwellings of the poor, and he was sure those who used that hall would feel satisfaction that his honoured name was inscribed on one of the pillars of that handsome hall.

Sir W. M'Arthur, M.P., proposed, and Mr. J. E. Vanner seconded, a vote of thanks to the chairman, who, in response, also referred to the philanthropic labours of the Earl of Shaftesbury as a young man, in exposing the disgraceful condition of the London slums, and to the valuable results that had followed his labours.

After some complimentary votes the company went over the works, where the Earl of Harrowby addressed a few words to the workmen, and then tea and coffee were served in the "Queen's Hall."

The following letter from Sir Dighton Probyn, dated Killarney House, Killarney, April 18, relating to a copy of the illustration in *The Architect*, was received by Mr. G. H. Chubb too late to be read at the ceremony:—"I have shown to the Prince of Wales your letter of the 15th inst., and the drawing of your new buildings which was enclosed in it. The Prince was pleased with the sketch, and expressed a hope that other large firms might be induced to follow your example and provide equally comfortable accommodation for their workmen."

It may be mentioned that Mr. R. L. Lowe, of Farnworth, Bolton, laid the floors with his patent wood-block flooring.

## VALUATION OF BUILDINGS.

THE Assessment Committee of the Nottingham Union having increased the valuation of the banking premises of Messrs. Moore & Robinson (Limited) in Nottingham, an appeal was lodged by the owners. In 1877 the property was valued at 500*l*. The Assessment Committee increased the amount to 750*l*., but, after some correspondence, it was reduced to 625*l*.. The case was brought before a special session of four magistrates, when it was further reduced to 521*l*.. Against that decision the Assessment Committee appealed to the Quarter Sessions, and the case was heard before Mr. Buszard, Q.C., M.P. It was contended by the committee's counsel that the present value of the building was 8,000*l*., which at 4½ per cent. gave 360*l*., the total rental being estimated at 820*l*.. In support of that view witnesses were called. Mr. Fothergill Watson, architect, said that he had made a careful survey of Messrs. Moore & Robinson's bank. The area was 713 square yards, and there was a depth of frontage to the market place of 80 feet. He thought 820*l*.. a fair annual sum for which the land and the buildings ought to be assessed. He reckoned that the value of the land was 13,130*l*., and that of the buildings 8,000*l*.. Mr. W. A. Heazell, architect, said that he had made an estimate of the value of the bank for letting purposes. The price he put on the land was 13,600*l*., which at 3½ per cent. gave 476*l*.. for a ground rent, and the value of the buildings he stated at 7,300*l*., which at 4 per cent. brought up the total to 756*l*.. Mr. R. C. Sutton, architect, put the value of the land at 13,185*l*., and that of the buildings at 6,704*l*., which at 3½ and 4 per cent. respectively produced 729*l*.. as the rental. Mr. Castle said that

he had had experience as a rating valuer all over the country, and he assisted in valuing the town of Nottingham for the Assessment Committee in 1876. He valued the bank buildings at 7,200*l.*, and he put the fee simple of the land at 10,600*l.*, giving a rental of 700*l.*

On behalf of the bankers the following evidence was given. Mr. Robert Evans, J.P., architect, said that his opinion of the letting value of the bank was that it was 500*l.* gross, but he did not think that it would realise that amount by 50*l.* He should think that the building could be erected at 6*d.* a foot. Mr. Henry Hallam, estate agent, valued the property at 470*l.* gross rental, the net being about 400*l.* Mr. G. T. Hines, architect, gave the rental at 490*l.*, and Mr. Huskinson put a similar value on it. The building cost 6,000*l.*

Mr. Buszard, Q.C., in giving judgment, said he could not put his finger upon any portion of the evidence which justified the assessment of 62*½* *l.*, and what struck him the most was that it was a remarkable circumstance that ever since 1877, as admitted by the witnesses for the bank, other property in the neighbourhood had unquestionably increased in value 20 or 30 per cent. Yet it was contended that the property in dispute had stood still, or had only increased, as the judgment of the special session would seem to show, to the extent of 4 per cent. He could hardly accept that proposition. It seemed to him that the property should be valued at what it would cost a hypothetical tenant to provide such a structure in such a locality if one was required. Taking that and all other matters into consideration, it seemed to him a curious speculation how the assessment had been arrived at. Mr. Watson took the value of the land at 13,130*l.*, a figure which was practically not disputed, and it was admitted by Mr. Evans and those who were called for the bank to be a correct figure, yet taking that figure at 3*½* per cent., it only gave the amount of 460*l.* per annum gross. Then there was the estimated cost of putting upon the land a building of such a character as would not be in excess of the requirements of such a tenant as it was supposed would be necessary for similar premises. The witnesses for the Assessment Committee gave various speculations as to the value of the building, but they knew from the evidence of Mr. Huskinson precisely what it did cost, namely, 6,000*l.* That was 15 years ago, and the result of the evidence that was put forward practically showed that that was what it would cost to-day if the hypothetical builder had to erect the bank again. Mr. Watson took the buildings at 4*½* per cent., and the other witnesses called on behalf of the Assessment Committee took them at 4 per cent., which he (the Deputy Recorder) considered a fair thing. The building cost 6,000*l.*, which at 4 per cent. gave a gross annual value of 240*l.* That sum added to 460*l.*, the figure arrived at as the value of the land, produced a gross estimated rental of 700*l.* He very much regretted being left in the dark the day before by both sides as to what was the rating of property in the same locality. However, he had since become more acquainted with the locality, and he must say that he thought some evidence could have been called as to the value of other property in the neighbourhood, which would have been some sort of guide to the value of that property. Notwithstanding that he had arrived at the conclusion that a fair sum at which the gross estimated rental should be taken was 700*l.*, which would give a ratable value of 560*l.*

## Bygones.

"Antiquity after a time has the grace of novelty."—HAZLITT.

### THE BAYEUX TAPESTRY.

THE origin of the long piece of needlework called the Bayeux Tapestry has given rise to controversy. The short essay by Dr. Lingard, which is now published, is rarely referred to, although it is interesting as suggesting the difficulties which arise when the subject is considered by an historian.

This tapestry is a piece of canvas 19 inches broad and about 226 feet long, worked with worsteds of several colours, and divided into seventy-two compartments designed to represent in succession the conquest of England by the Duke of Normandy.

To make it even probable that this tapestry was, as is often affirmed, the work of the Conqueror's queen, Matilda, or a gift from her to the church of Bayeux, it is necessary to show that there exists some historical testimony; or, in the absence of such testimony, some ancient tradition; or, in the absence of both these, something in the character of the tapestry itself which may serve to connect it with the name of that princess:—

1. That there is no historical testimony which bears in any way on this question is admitted on all hands.

2. Neither is there any ancient tradition. It may be at present the popular belief at Bayeux, but it is not an ancient tradition; it cannot be traced further back than the year 1730, when it is first mentioned by Lancelot and Montfaucon. We are acquainted with earlier writers who have described the city of Bayeux, its cathedrals and its curiosities; but not one of them has ever noticed this supposed tradition. It was probably the conjecture of some antiquary, which was at first gratefully accepted, and has since been carefully preserved by the inhabitants.

We have two ancient inventories of the valuable articles formerly belonging to the church of Bayeux, the one made in 1369, the other in 1476. In both the tapestry is noticed; in neither is any mention made of its origin or of its donor. The latest of these inventories was made by two of the canons deputed by the chapter for that purpose, who not only enter every article separately, but notice also its *circumstances*, a word which is made to include the use to which it was applied, the name of the donor, and the tradition of the place with respect to it. Thus they tell us of a chasuble which belonged to Bishop Odo; of a helmet which belonged to Duke William; of two mantles, adorned with jewels, which, according to tradition—*comme on dit*—were worn by William and Matilda at their marriage; of two hangings, the gift of the patriarch of Jerusalem; and of a very long and narrow piece of tapestry, with drawings and writings representing the conquest of England:—"Une tente tres longue et etroite de telle à broderie de ymages et escripteaulx faisans representation du conquest d'Angleterre." This last was undoubtedly the tapestry in question. Now what are the *circumstances*? Do the deputies name the donor? Do they notice any traditions respecting it? No; all that they tell us is that it is yearly hung round the nave of the church on the festival of the relics (July 1), and during the octave. Most assuredly if there had then existed at Bayeux any popular belief respecting the origin of the tapestry, they would have noticed it in the same manner as they noticed the *on dit* respecting the two mantles. Their silence then is a satisfactory proof that the tradition to which appeal is now made had no existence in the middle of the fifteenth century.

3. But is there not something in the tapestry itself to induce a belief that it was the work or the gift of Matilda? No: there is absolutely nothing. She is not named in the supercriptions; she is not represented in the drawings. There are three figures of females, but not one of her. There were many compartments into which she might with propriety have been introduced, but she seems to have been as much forgotten by the artist as if he had never heard of her existence. Nor does the costliness of the work bespeak a royal benefactor. It is of the most homely materials, of ordinary canvas worked with worsteds of different tints, which serve only to depict the forms of the objects and not to imitate their natural colours. There is in it no embroidery of gold, none of silver, none of silk, nothing worthy the rank or the munificence of the supposed donor. Hence, in the absence of all historical evidence, of all ancient tradition, and of any proof to be derived from the tapestry itself, it is difficult to conceive on what ground it is so confidently and pertinaciously attributed to the queen of the Conqueror.

The reader will have noticed the immense disproportion between the breadth of the tapestry (about 19 inches) and its length (226 feet); a disproportion which shows that it was originally intended to decorate some building of considerable extent. What building was that? Plainly the church of Bayeux; for there we find it centuries ago annually decorating on certain festivals the whole circuit of the nave, its measurement being then, as it still is, the same with that circuit. Whether it would have equally suited the nave of the church which existed in the time of Matilda may be doubted, for that church was destroyed with the episcopal buildings in 1106, twenty-three years after her death, and the new one was not built till half a century later. But be that as it may, there cannot be a question that the tapestry was originally meant as a decoration for the church of Bayeux; and in the composition of several of the compartments there is much to show that it was designed also to commemorate the share which the men of Bayeux bore in the conquest of England. Of all the noble and powerful chieftains who accompanied the Conqueror, two only, if so many as two—namely, his brother, Robert of Mortain, and perhaps Eustace of Boulogne—are depicted in it, and pointed out by name, and that only once; but the attention of the spectator is directed in the same manner to Odo, the Bishop of Bayeux, in three separate compartments. Nor is that all. Three other individuals—Turolf, Vital, and Wadard—are equally distinguished in compartments 11, 49, and 62. Their names are given as if they were of higher importance in the estimation of the donor or artist than the most illustrious barons and chieftains in the army. Who then were they? Look into the pages of history and you will not find them. They were unknown to William of Poitou and Orderic and Wace. But open the record of Domesday, and there you meet with them in almost the first page—three men of Bayeux, all

homagers of Bishop Odo, all rewarded by him with lands in England for their services. Ralph, the son of Turolde—the father was probably dead when the survey was made—appears in possession of nine different properties in Kent (Domesday, 1, 7, 8, 9), Vital of three (ibid. 7, 10), and Wadard—the *hic est* Wadard of the tapestry—of more than thirty in the counties of Kent, Surrey, Dorset, Warwick, and Lincoln, besides six burgage messuages in Dover (ibid. 1, 6, 7, 10, 32, 77, 155, 238, 342). What right could these obscure retainers of the Bishop of Bayeux have to be depicted and designated by name in preference to the most noble and celebrated of William's associates? I would rather believe that the tapestry originated in the personal vanity of some of these men, or of their descendants, than that Matilda would so highly distinguish them in a work designed by her to commemorate the conquest of England by the arms of her husband.

### "Pecksniffs."

SIR,—Noticing in your issue of the 11th inst. a lengthy and somewhat over-critical analysis of Charles Dickens's delineation of Pecksniff "By a Correspondent," I cannot resist the temptation to make a few remarks on his indignant refutation of the author's so-called slander on our honourable profession.

The first thing which becomes plainly evident to the mind in perusing the article is the fact that Dickens is by no means among the favourite authors of the writer, who so far fails to appreciate him as to be unable to properly understand and interpret his acceptedly clever caricatures, which are generally, and in this instance unfortunately, far from being incorrect. Though a great deal could be said which might lessen the value of "Correspondent's" opinion of Dickens as an author, and his not over-correct interpretations of various parts of the work in question, to open a discussion on such a subject would be both unnecessary and out of place in a paper of this description. The main object of the article is apparently to prove, or more correctly to assert, that Pecksniff never did nor does now exist, except in imagination—that is, so far as the experience of "Correspondent" can show; for, look where he will, he has failed to discover in the architectural ranks any resemblance to that "mean, dishonest, hypocritical" individual, and is so confident in himself as to defy the production of a second Pecksniff. "Correspondent" either must have kept his eyes shut to the little failings of his professional brethren, or is fortunate enough to move in an exceptionally exalted sphere of professional virtue. Or, may be, he has been searching for the counterpart among the cream of the profession, and, as a matter of course, has failed to discover any such thing. I emphasise "discover" advisedly, for, if the rumours which one hears (not always without foundation) are anything to go by, there is more Pecksniffian element among the "upper ten" than does credit to our honourable fraternity. Unfortunately, my lot has so far had a different aspect to "Correspondent's," for, degrading as the confession may be, there is scarcely one despicable trait in the character of the contemptible Pecksniff of which I have not seen its duplicate in one or another of the black sheep which are to be found in the architectural flock which goes to make up the profession.

No doubt "Correspondent" will be both astounded and indignant at this broad assertion, but it is nevertheless only too true, and there is many a right-meaning, hard-working "youngster," starting with the good and honour of the profession at heart who could add his testimony to this, founded on his own sad and bitter experience, for never was there such a time when the honour of the profession was so degraded and dragged through the mire as now, and by a certain class of individuals calling themselves architects, who if they do not copy every one of the iniquitous practices of Pecksniff, it is not because they are incapable of so doing, but because they have not the opportunity. The will is undoubtedly there, and Dickens's caricature is none the less a reality because circumstances are not sufficiently favourable, and opportunities not forthcoming, by which these modern Pecksniffs could further testify to the truthful portrayal of the original by their injurious and dishonest practices.

In conclusion, while I admire and envy "Correspondent's" exalted and somewhat ethereal view of the profession, I regret that, while I continue to see and hear the almost daily incidents which prove that Pecksniff has only too many faithful followers, I shall be unable to endorse his opinion.

I am, sir, yours faithfully,  
ONE WHO HAS SEEN PECKSNIFF.

A Hospital is to be erected in Holloway Road for which six architects will be invited to compete.

## SCHOOL BUILDINGS.

**Accrington.**—As new Church schools are to be erected in Hargreaves Street, the committee invited Messrs. Maxwell & Tuke, of Manchester, Messrs. Stones & Gradwell, of Blackburn and Accrington, and Mr. George Baines, of London, to prepare designs. The design submitted by Messrs. Stones & Gradwell has been selected. Accommodation is provided on the ground floor for 304 girls, 176 infants, and 72 babies. A tea-making room is also provided, having a lift for communication with the upper floor. By raising a revolving shutter between this room and the adjoining class-room, a large room is obtained for cookery classes. There is ample playground accommodation, part of which is under cover. On the first floor there is a large assembly room, containing 337 square yards. There is also a lecture hall containing 151 square yards, a large committee-room, and ante-room. For Sunday school purposes the assembly-room can be divided into a number of class-rooms.

**Sharples.**—The Belmont day schools have just undergone reconstruction and enlargement. The works of extension and improvement have been carried out from plans prepared by Mr. Grundy, architect, of Manchester.

**Upton.**—New National Schools and schoolmaster's house, erected at the cost of the Humberstone family, have been opened. The work was begun about nine months ago, and has been carried out by Mr. Beckett, contractor, of Hartford, from the designs of Mr. E. A. Ould, architect, of Chester.

## GENERAL.

**Mr. Ruskin** has, it is said, resigned the Slade Professorship of Art at Oxford, and will not deliver the remaining lectures of this year's course.

**The Annual Costume Ball** in aid of the Prize Fund of the Chiswick School of Art will be held on May 6.

**Mr. T. Chatfield Clarke** has been nominated as one of the surveyors and umpires of the Board of Trade.

**Works of Art** intended for the Summer Exhibition of the 19th Century Art Society are to be sent to the Conduit Street Galleries on the 30th inst.

**The Committee** on the West Front of Westminster Hall have decided to take the draft report which recommends the adoption of Mr. Pearson's plan as the basis of their final decision in the matter.

**Mr. G. D. Oliver**, of Carlisle, has been appointed architect for the new infirmary which is to be erected at Workington. The works are to be commenced as soon as working drawings are prepared.

**The German Reichstag** have rejected the proposal to increase the duty on imported slates, which would have seriously affected the English trade. The duty on slates imported by sea continues at 6*d.* per cwt., as heretofore.

**The Artisans' Exhibition** in Dublin will be opened on June 24.

**A Reconstruction** of Holy Trinity, South Shore, Blackpool, is contemplated. It is intended to provide in the new church about 1,000 sittings, the estimated cost for completion being between 7,000*l.* and 9,500*l.*

**The Metropolitan Board of Works** have agreed to lend 30,000*l.* to the St. Saviour's Union towards the cost of erecting a new infirmary at East Dulwich Grove.

**Professor Rudolf von Eitelberger**, the art historian, Professor of Art History at the Vienna University, and founder of the Austrian Museum for Art and Industry, died on Saturday last at Vienna.

**The Foundation-stone** of the new building of Sion College, on the Victoria Embankment, was laid on Tuesday. The new building will be Tudor in style. The material will be of red brick with facings of Doulton stone. Mr. A. W. Blomfield is the architect, Mr. J. T. Chappell the builder, and Mr. T. Simpson clerk of the works.

**Madame N. Rothschild** has subscribed 5,000 frs. towards the erection of the memorial of Eugène Delacroix, and Baron Arthur Rothschild 1,000 frs.

**The Electric Lighting** of the Leeds Municipal Buildings has been dispensed with for the present, in consequence of the litigation pending between the Corporation and the contractors for the light.

**The Edinburgh Town Council** have agreed to subscribe a sum of 2,500*l.* to the guarantee fund of the proposed international exhibition in that city.

**A Sanitary Hospital** is proposed to be erected for Warwick, to provide thirty beds at an average cost of 150*l.* each.

**BATH STONE.**

UNRIVALLED FOR QUALITY, DURABILITY, AND ECONOMICAL WORKING.

**PICTOR & SONS,**

Quarry Owners and Stone Merchants.

"For durability, uniformity in structure, facility and economy in conversion, and for  
advantage of colour, they are unequalled."

ANCASTER STONE {

FROM

MR. LINDLEY'S QUARRIES,  
ANCASTER, near GRANTHAM,

IS a good-looking Stone, easily worked, and, though soft when first quarried, becomes hard  
with exposure, and very durable.

## HALL'S PATENT HANGING TILES.

The Tiles are used for facing old or new walls and partitions in courts, areas, or corridors, requiring light, or for  
shops, dairies, stables, &c. They are secured by nails to battens or rough boarding, and on the face of walls by nails  
driven into the joints of the brickwork, the Tiles being made to course with brickwork. They can also be fixed to  
fireproof work of iron and concrete, and are well adapted for lining subways and baths.

The surfaces of the Tiles are decorated with patterns in various colours, stamped, or in relief. They are easily  
fixed by unskilled workmen; cannot fall off; are not affected by damp, fire, and frost.

MANUFACTURED BY

JOSEPH CLIFF & SONS, WORTLEY, LEEDS.

London Depot:—2 &amp; 4 Wharfs, King's Cross Goods Station.

STEWARDS & CO. (Limited), Portland Stone Merchants, Isle  
of Portland, and at Portland Wharf, Grosvenor Road, Piccadilly.  
Prices on application.

A Business Supplement

# The Contract Reporter.

to The Architect.

LONDON, APRIL 25, 1885.

## JUDICIAL FORM AND SUBSTANCE.

A CASE which was heard a few days ago in London is another instance of the difficulties of the Courts when dealing with building accounts. The action was taken by Mr. Jowett, who is a paviour and contractor against the owner of some houses at Goole for the expense of paving opposite to the houses. There was a contract to do it at 1s. 9d. per square yard, but there was a conflict of evidence as to whether this was to be for the mere paving, or whether it was also to include the cost of "sewering and levelling." The case for the plaintiff was that it was to be only for the paving, and he called the surveyor of the local board to prove that 1s. 9d. a yard was a fair price for that, and that 2s. 6d. a yard would be a fair price if it was to include the sewerage. At the rate of 1s. 9d. a yard the amount would be 47l., for which accordingly the plaintiff claimed. The defendant paid into Court 26l., deducting 21l. which he had to pay to the local board for "sewering and levelling." The case was remitted to the County Court at Bradford for trial, and the Judge, upon the evidence, thought that the parties were never *ad idem*, so that the contract at 1s. 9d. a yard was not made out, and he nonsuited the plaintiff.

On behalf of the plaintiff Mr. Frank Mellor now moved for a new trial, on the ground that the judge was wrong, as the plaintiff would be entitled to recover the whole sum on a *quantum meruit*, or, at all events, to recover the real value of the work, whatever it was, and he ought not to have nonsuited the plaintiff. [Mr. Justice Lopes: I do not see how he could nonsuit; but ought he not to have given judgment for the defendant?] No, because there was evidence that the work done was well worth 47l., apart from the contract. [Mr. Justice Manisty: But there was evidence, on the other hand, that the plaintiff contracted to do the whole work, including the sewerage, for the 1s. 9d. a yard.] That was not so in fact, and the judge did not enter into the question of true value. [Mr. Justice Lopes: The judge may have been wrong in point of form, but I am inclined to think he was right in substance. Mr. Justice Manisty thought so too, and said the judge seemed to have adopted the view that the 1s. 9d. a yard was to cover the sewerage, or that, at all events, it was not made out that it did not.] But he ought to have found that it did in order to nonsuit the plaintiff. [Mr. Justice Lopes: That, no doubt, is the flaw in his judgment, but it is a mere point of form.] The plaintiff is entitled to judgment.

The Court came to the conclusion that they could not, as the case stood, direct a judgment for the plaintiff. Neither could they grant a new trial, as it did not appear that there had been any substantial miscarriage, though there may have been an error in mere form. There was a conflict of evidence as to whether the 1s. 9d. a yard was to include everything, and they rather thought that it was, and the judge, thinking that it was so, found that it was not proved that anything more than the sum paid into court was due, and so in form he ought to

have given judgment for the defendant, and not a nonsuit; but that was not material, and, as substantial justice had been done, the application would be refused, and judgment given for the defendant.

## OVERHEAD WIRES IN LONDON.

A COMMITTEE of the House of Commons has been appointed to inquire into the subject of telegraph and telephone wires. At the first meeting, Mr. G. Noah Johnson, Chairman of the Commission of Sewers of the City of London, stated that he was of opinion that legislation for the control of the wires had become necessary. With regard to the mode in which the wires should be fixed, he believed that it would be well to put them all underground, if it were within the bounds of possibility, consistently with the practical working of the wires. But the difficulties in the way of putting them underground were insurmountable, chiefly on account of the enormous cost. It was also, he believed, the fact that the difference between the conditions of telephone and telegraph wires was such as to necessitate the separation of the one class from the other. For scientific reasons it was held desirable that telephone wires should be carried overhead and telegraph wires underground. If the whole expense of putting telephone and telegraph wires underground were to be put upon the companies it would be too great for them to bear. With regard to the administration of the law in this matter, he would entrust it to the local authorities who had control over the streets, but he had no doubt that the governing body of the City of London would be able to efficiently exercise any jurisdiction given to them. There were ten times more wires overhead in the City now than there were a few years ago, and so close together were they that in the event of a heavy gale of wind or a very severe snowstorm there would be serious danger of their coming down and doing serious damage. Colonel Heywood, Engineer to the Commission of Sewers, having charge of the roads and pavements in the City, also spoke of the rapid increase in the number of overhead wires in the metropolis. The increase, he said, had already become so great in the City that the wires now constituted a grave public nuisance. To show the number of wires stretched across the streets he declared that there were 320 over Moorgate Street; over Coleman Street, 312; Leadenhall Street, 240; Fenchurch Street, 160; and Queen Victoria Street eight cables and 408 wires. At one spot in Fleet Street—viz., at Ludgate Circus—there were to be counted two cables and 142 wires; across King Street there were six cables and seventy-four wires, and over Cannon Street seven cables and 360 wires. Over some of the streets of the City there were something like from 1,200 to 1,500 lines a mile. He was of opinion that in the future the telegraph and telephone wires would become so numerous that it would be absolutely necessary to put them underground, and to the expense of carrying out this work the local authorities and the public bodies and private companies should contribute.

## COMPETITIONS OPEN.

BOOTLE.—May 1.—Plans and Specifications are invited for the proposed Erection of Public Baths. Mr. J. Alexander, Borough Surveyor Bootle.

WHITCHURCH.—May 9.—Designs are requested for a Small Cottage Hospital. Major Lee, Whitchurch.

## CONTRACTS OPEN.

**MARKET WEIGHTON.**—April 29.—For Constructing Covered Reservoir, Buildings, and other Works at the Waterworks. Mr. J. F. Fairbank, C.E., 14 Parliament Street, Westminster.

# R. ADAMS,

17 BLACKMAN STREET & 7 GREAT DOVER STREET, LONDON, S.E.,  
INVENTOR and PATENTEE of the  
SAFETY WINDOW WITH REVERSIBLE SASHES

## FOR INEXPENSIVE & PERPETUAL CLEANLINESS

Which has gained at the INTERNATIONAL HEALTH and  
SANITARY EXHIBITIONS

2 Gold, 4 Silver, and 4 Bronze Medals,  
and 16 Diplomas of Merit.

The fearful sacrifice yearly of Life and Limb of persons in cleaning windows through sitting or standing outside whilst so engaged is most appalling. This can now be entirely prevented. The Patentee, having given this subject the most exhaustive study, is now prepared to supply his patent fittings suitable both for old and new windows at prices to meet the means of all. These improvements are protected by several patents, by each of which the outside of each sash can be reversed for cleaning, and under this new system that duty is rendered a pleasure, whilst the danger, risk, and tremendous responsibility of moral and statute law is removed.

These patent fittings can be procured from 5s. for each sash, and all builders have the right conferred upon them to fit the same in the purchase thereof, and that all shall have the benefit of this national boon, special Agencies are being established throughout the United Kingdom. None but practical and responsible firms are appointed. Such firms are invited to apply for unrepresented districts at once, as it is desirable to complete the list as soon as possible.

The present representatives are:—

Barnstaple . . . . .  
Belfast and 10 miles round . . . . .  
Bournemouth and 10 miles round . . . . .

# RENDLE'S "ACME" GLAZING

Patentees:—**W. E. RENDLE & CO.,**  
3 WESTMINSTER CHAMBERS, VICTORIA STREET, LONDON.

TO  
ARCHITECTS, BUILDERS,  
AND  
CONTRACTORS.

**STEEL CUT NAILS!!**

The modern and important discovery in the process of making Steel has so reduced the price, that Steel Cut Nails of the well-known "Mitre Brand" can now be supplied at only 1s. 6d. per cwt. more than the price of the ordinary Common Iron Cut Nails.

The Steel Cut Nails are far superior in quality and more uniform in size than any wrought or hand-made Nails yet produced, and being lighter in weight than ordinary Iron Cut Nails and free from wasters, they are found cheaper in actual use than common Iron Cut Nails at 1s. 6d. p. cwt. less.

These Steel Cut Nails are specially suited for Builders, Joiners, Coopers, Packing-Case Makers, &c., and a single trial is sufficient to convince any one of their superior quality and cheapness.

**PATENT WROUGHT STEEL NAILS.**  
**OVAL WIRE NAILS.**

Ask your Factor or Ironmonger for  
"MITRE NAILS."  
WHOLESALE AND EXPORT ONLY.

FIRST-CLASS CERTIFICATE AND SILVER MEDAL  
AT CALCUTTA EXHIBITION.

**AS SUPPLIED TO 600 PUBLIC HEALTH BODIES.**

The Sanitas Co., Limited, Bethnal Green, E.

**GRUNDY'S PATENT WARM-AIR VENTILATING FIRE GRATE.**

The novelty, superiority, and advantage of this patent consist in the heating surface being greater than any other Fire-grate introduced to the public. It is very simple in construction, and is made in the form of a Stove, the back of which is semicircular in shape, with gills behind and smoke-nozzle on top, all cast in one piece. The same can be attached to any design of a Register or Stove front. It is very suitable for schools, class-rooms, waiting-rooms, hospitals, offices, dormitories, and dwelling-houses, from the cottage to the mansion. Design and specification post free on application.

**TESTIMONIALS.**

"9 Victoria Chambers, Westminster, S.W.

"June 10, 1884.

"SIR,—I have much pleasure in testifying to the efficiency of your patent Warm-Air Fire Grate. It has been very successful, and given every satisfaction where I have used it.

Yours, &c.

"To Mr. Grundy.

JAMES WEIR, F.R.I.B.A."

"Baptist Chapel, Clapham Common, London. Richard Webb, Pastor, 10 Grafton Square.

"February 15, 1884.

"DEAR MR. GRUNDY,—I have pleasure in testifying to the excellency and efficiency of your patent Fire-Grate. It is the most charming invention for heating a large room I have ever known. I shall have pleasure in showing it to anyone who wish to have their schools or rooms pleasantly and efficiently heated."

From James Garry, Esq., Architect, West Hartlepool, July 1884.

"DEAR SIR,—I have very great pleasure in stating that the first stove, or patent warm-air ventilating fire grate, adopted by me in school at Seaton, and a second in a Cocoa Palace, have given such satisfaction that I now order eleven to be inserted in New Upper Grade Schools in course of erection at West Hartlepool. They are the most economical, efficient, and easily managed stove at present before the public.

"Mr. John Grundy."

From Hon. and Rev. G. G. C. Talbot, M.A., Withington, Cheltenham.

"DEAR SIR,—You will be gratified to hear that the school is completely warmed by your new grate. It is the most economical and efficient that I have ever seen.

"Mr. John Grundy."

From F. J. Yates, Esq., Architect, Birmingham.

"The best of the kind I have seen. I shall have pleasure in securing their adoption whenever opportunity offers."

"Mr. John Grundy."

Apply to JOHN GRUNDY, 30 Duncan Terrace, City Road, London.

Works—TYLDESLEY, near MANCHESTER.

THE GREAT PROBLEM OF THE XIX<sup>TH</sup> CENTURY.  
**VENTILATION**  
WITHOUT DRAUGHT.

The hitherto unsolved problem of "Ventilation Without Draught" is to be seen practically illustrated at FREDERICK HENRY SMITH'S Test Room, No. 68, 52 Queen Victoria Street, E.C., Patentee of the Automatic Siphonic Aspirator System of Ventilation. A personal inspection invited.

*Extract from the Annual Report of the "French Hospital and Dispensary," issued 29th January, 1885.*  
We have also to return our best thanks to Mr. Smith, who undertook gratuitously to repaint one of our wards and to apply a new system of ventilation of his own invention, which was very successful.

*Letter from David Urquhart, Assistant Engineer to Colonel Sir Francis Bolton, C.E.*  
F. H. SMITH, Esq., 52 QUEEN VICTORIA STREET, E.C. 4 THE SANCTUARY, S.W., LONDON: NOVEMBER 22nd, 1884.  
In reply to your inquiry, I have much pleasure in certifying that your system of ventilation as applied to the "Island Room" of the illuminated fountains at the Health Exhibition reduced the temperature during the displays from about 110 deg. to about 70 deg., and thus enabled the men to perform their duties without inconvenience.—Yours faithfully,  
DAVID URQUHART.

*Extract from the TIMES of March 14, 1885, page 7.*  
"VENTILATION WITHOUT DRAUGHT.—This desideratum appears to be accomplished by a syphonic system devised by Mr. Frederick H. Smith, at whose offices, 52 Queen Victoria Street, London, we recently inspected the arrangement. The air supply is conducted into the apartment from the external atmosphere by means of air ducts, which terminate in distributing passages at the floor level. The exit for the vitiated air is placed in the ceiling, and consists of two tubes, a large and a small one, running parallel to each other between the floor joists in the case of rooms having others over them. In the case of rooms on top floors, or those having the roof directly over the ceiling, the tubes are placed concentrically, but the action and results are the same. The larger of the two tubes carries off the vitiated air, while the smaller one forms an induction tube for cold air, its outer extremity being open to the atmosphere. These two tubes or conduits are so connected that the passage of the heated air through the larger tube induces a current of cold air through the smaller one in a continuous stream. The result is a rapid clearing away of all deleterious gases and products of combustion as they accumulate, and the preservation of a pure atmosphere at an equable temperature in the apartment. In a small room at Mr. Smith's offices in which five large gas-jets were burning, the atmosphere was apparently quite innocuous at the level of about 7 feet, the temperature being about 60 deg. Fahr. At a higher level, however, and especially near to the ceiling, the temperature was high and the air greatly vitiated. It was demonstrated that this vitiated air was being drawn off through the exit tube, which acted as a powerful sucker. After turning off the gas-burners, and upon the temperature of the room generally becoming lowered and equalised, a feeble upward action was still maintained in the upcast tube, but there was no down-draught whatever. The system has already been applied to a church and other buildings with acknowledged success."

## COMPTON GIFFORD.

## NOTICE OF REMOVAL.

# BELLMAN'S PATENT GULLY.

This Gully possesses the following advantages:—  
**Receives and disconnects one Rain-water Pipe and Three Waste Pipes.**

**Avoids all Splashing.** **Forms Drain for Area or Surface.**  
**Ventilates the Pipes and Trap.** **Is easy of Access for Clearance.**

The ordinary P or S trap to be used in connection with Gully being in a separate piece, can be placed at any angle to meet the drain exactly, thus insuring a perfect joint, the Gully being fixed at right angles. This is a great advantage over other arrangements made with the trap in one piece.

The Holes for Rain-water Pipes are made both Circular and Square and of various sizes.

DESCRIPTIVE CIRCULAR ON APPLICATION.

**THIS GULLY IS HIGHLY RECOMMENDED by Authorities on Sanitary Matters.**

PRICE AT DEPOT:—EDWARD ST., DORSET SQUARE, N.W., 8s. 6d. each.

Also SINGLE GULLIES, for Sink Wastes only, price 3/9 each.

**BELLMAN & IVEY,**  
 (OFFICE ONLY) 37 PICCADILLY, LONDON, W.

## HIGH CLASS NON-ARSENICAL WALL PAPERS.

**WILLIAM COOKE & CO.,** Paperhangings Manufacturers, LEEDS, produce Papers of the Highest Class, and of the most Artistic Merit. They are **GUARANTEED FREE FROM ALL ARSENICAL COLOURINGS**; have been, and continue to be, tested and recommended by eminent analytical Authorities. — Pattern Books can be seen at all the Principal Decorators. N.B.—The Trade only supplied.

## ELECTRIC HOUSE BELLS.

For Mansions, Banks, Hotels, Houses, Offices, Yachts, House to Stable, and all purposes. LIGHTNING CONDUCTORS. FIRE TELEGRAPHS. SPEAKING TUBES.

Catalogue on application. Estimates free. **FRANCIS & CO.,** Eagle Telegraph Works, Hatton Garden, London, E.C. Best Goods only. The Trade supplied.  
**ELECTRIC HOUSE BELLS.**  
 FIRST PRIZE MEDALS from all the leading Exhibitions at Home and Abroad.

## NOTES ON NOVELTIES.

## Improved Building Paper.

The CHEMICAL PAPER'S COMPANY (Limited) of 3 Lombard Court, E.C., have appointed Messrs. Eastwood & Co. (Limited), Belvedere Road, S.E., their sole London agents for the valuable building paper manufactured by them. The improved building paper is designed to take the place of felts, canvas, and more expensive papers. Among its advantages are the following:—That it is extremely cheap, being 2d. per running yard, about 40 inches wide. Cleanliness, as compared with felt, because the hottest sun does not fry out the coal tar pitch with which it is impregnated, so that it retains a clean, hard surface. It is water and damp-proof, and the waterproofing material is throughout the entire texture of the paper, increasing its firmness and solidity, and making it thoroughly damp-proof; and, moreover, it is easy of joining, for by lapping the edges of the paper and applying hot coal tar pitch, a firm waterproof joint is made. These advantages suggest the adaptability of the paper for placing on damp walls, and walls from which it is difficult to prevent the paper peeling off. One reason for this peeling off—often overlooked—is the fermentation of the paste or other adhesive material used. This is usually due to a microscopic fungus growth readily developed wherever heat and moisture are present. A great advantage in the use of this paper in place of other damp-proof materials is that it possesses antiseptic properties preventive of the growth of vegetable fungi, and the consequent "spoiling" of the adhesive material and peeling off of the paper. It can be applied with any adhesive material used for ordinary papers direct to the walls, whether new or old, and the finest papers applied direct to its surface, and its superiority over most materials such as lead, paint, &c., especially recommend it for this purpose. The Paris Syndicate of Architects, the highest authority

in France, have recommended it after thorough tests. It is also most useful as a lining beneath tile and slate roofing. It makes the roof watertight and wind-tight, and lessens the conduction of heat or cold; also as a lining beneath weather boarding in all wooden houses, sheds, &c., to make wind and dust tight.

## TRADE NOTES.

MESSRS. FRANCIS & Co., Eagle Telegraph Works, Hatton Garden, E.C., have been successful in the competition for the complete installation of electric lighting throughout the new Congress Hotel and Avenue at Toronto, together with electric bells and indicators to and from each apartment of the several buildings, and direct telephonic communication between the hotel and the Dominion telegraph stations. This will be, perhaps, the most extensive application of domestic telegraphs in existence, and great credit is due to this enterprising firm in the success which has attended their efforts to outvie our keen rivals on the other side of the Atlantic.

THE interesting old Temple Church, London, has lately been enriched by a fine stained-glass window of more than usual interest, on account of its being a memorial to the last acting Master in Chancery, Mr. Charles Beavan, M.A. It consists of three lights, is on the north side next to the organ, and contains, as subjects, seven miracles of our Lord in medallions as follows:—The sight of the man who was born blind restored; the nobleman's son cured; the widow's son raised to life; the lame man at the pool of Bethesda healed; the demoniac boy cured; the woman with the issue of blood healed; and the ten lepers cleansed. The general groundwork of the window is formed of geometrical bands of colour and scroll ornament of tinted white glass, the whole having a chaste and light effect. At the base of the window the dedicatory inscription runs thus:—"In memory of Charles Beavan, M.A., of Gonville and Caius College, Cambridge, one of the Masters of the Bench of the Honour-

able Society of the Middle Temple, 1884." The window, though light, is rich in colour, is carefully drawn and painted, and was executed by Ward & Hughes, of Frith Street, Soho Square, London.

Two Munich stained-glass windows have just been erected in Newbattle Church, Dalkeith, in memory of the late Mr. Craig, representing the two acts of charity, "Feeding the Hungry" and "Teaching the Young." The artists are Messrs. Mayer & Co.

MESSRS. W. M. PEPPER & Co., stained glass manufacturers, have removed from their old address, No. 381 Euston Road, to larger and more suitable premises at No. 374. We understand that Mr. Boyes, who for some years has been connected with the firm, has now become a partner, so that in future the business will be carried on under the style of Pepper & Boyes.

MESSRS. WHITFIELD & Co., of Viaduct Works, Oxford Street, Birmingham, have received instructions to supply their patent screw bolt steel intersected doors to the whole of the new premises of the Birmingham Banking Company, now in course of erection at Bennett's Hill, Birmingham. The same firm have also received orders for a supply of similar doors for the Birmingham Art Gallery.

THE Birmingham Sanitary Association is engaged in remodelling the sanitary arrangements and applying their system of sewer ventilation to the following residences:—Manly Hall, Lichfield, for Mr. A. E. Manley, D.L.; Woodseat, Uttoxeter, for Mr. P. J. Campbell; and Oldsprings, Market Drayton, for Mr. E. Harding, J.P. The whole of the work has been executed under the personal direction of Mr. A. G. Wallis, the engineer to the Association.

THE directors of the Army and Navy Co-operative Society have accepted the tender of Messrs. R. Waygood & Co., Falmouth Road, S.E., for erecting four hydraulic goods hoists, each to lift 30 cwt. about 90 feet, with the necessary pumps, tanks, accumulators, &c., at their central depot, Francis Street, Westminster.

## THE "HARDING" VENTILATING COMPANY,

30 EAST PARADE, LEEDS.

HARDINGS' PATENT AIR DIFFUSER  
FOR VENTILATING ALL KINDS OF BUILDINGS.

Mr. T. PRIDGIN TEALE, F.R.C.S., M.A., Surgeon to the General Infirmary at Leeds, says of Hardings' Diffuser in his book called "Dangers to Health":—"I am satisfied that by means of this apparatus, we can secure in a town freshness of atmosphere, absence of draught, and exclusion of dirt."

The fresh air is conducted through a grate and aperture in the wall, as shown on section, about 7 feet 6 inches above the floor level; it is then conveyed through the filter, and passed into the room through a series of small tubes placed at an angle of about 39 deg. with the wall.

By these means the currents of air rushing into the apartment are compressed whilst passing through the tubes. The currents of air, as soon as liberated, expand, cut into, and break each other up, and diffuse in all directions so effectually that no draught or chilly sensation can possibly be experienced by the occupants, and at the same time a large volume of pure air is constantly being admitted and dispensed evenly through the apartments.

Diffuser with Filter.

**CHURCH WALL VENTILATOR.**—As used in the ventilation of Archbishop Zouche's Chapel, York Minster.

The DEAN OF YORK, with reference to the ventilating of Archbishop Zouche's Chapel at York Minster, says:—"I think the ventilation is perfectly successful, and all I have spoken of about it are well satisfied with it, and much pleased with the result."

**OUR PATENT EXTRACTOR** is the best in the Market, and is supplied at a very much lower price than any other.

**CHURCH WINDOW VENTILATOR.**—These Ventilators are used for Churches, Chapels, and other Public Buildings where it is not desirable to have holes cut through the walls to admit air in the usual manner. The appearance is not more noticeable than the ordinary Hopper Ventilator so frequently seen.

"GENTLEMEN,—I have pleasure in stating that in my opinion your system of ventilation, introduced in our Church this summer, is a decided success. Heretofore when the Church has been well filled at the Evening Service, I have been almost exhausted by the effort of speaking before I have got half through. On Sunday night, October 7, at our Harvest Thanksgiving, we had a very large congregation, and I preached without the least feeling of weariness or exhaustion. I shall be glad to hear that your Air Diffusers are being widely adopted.—I am, yours truly, JOHN GREGORY, Minister of Oak Road Congregational Church, Leeds."

These Ventilators are more suitable for Schools, Warehouses, and other Buildings where cheapness is an object. The result is precisely the same as in our other styles, at a very much smaller cost.

Air Extractor.

A reduction in price is made where a number of Diffusers is required.

Estimates and further information given on application to the "HARDING" VENTILATING CO., 30 East Parade, Leeds.

# "THE PEDESTAL VASE," JENNINGS' IMPROVED W.C. APPARATUS

(Combination Urinal and Slop Sink).

Registered No. 16,300.

A PORCELAIN VASE set on a tiled or mosaic floor, within walls or a dado of glazed tiles. The usual wood framing, forming a storehouse for the retention and accumulation of damp, dirt, and disease germs, with the joints, crevices, and imperfections in work which the closet enclosure so often conceals, is entirely abolished. The seat is hinged, permitting free access for use as a *slop sink* or *urinal*, and for cleansing, so that the entire apparatus and space can be freely washed down. For this latter purpose the floor should be slightly sunk, and laid to fall to a grating, with waste carried through the external wall, and terminating in a copper flap valve to prevent draught.

The suggestions as regards wall linings and floor, may, of course, be modified as best adapted to the building in which the closets are used; and in the consideration of such details, alternative schemes will readily present themselves.

At the recent **HEALTH EXHIBITION** (South Kensington, 1884), amongst a series of official tests, under the supervision of Baldwin Latham, Esq., C.E., and the Jury No. 9, Class XXIII., and successfully witnessed by this closet, the following may be cited in evidence of its efficient action. Being fixed in position shown in illustration, with "**JENNINGS' PATENT SINGLE FLUSH WASTE-PREVENTING SYPHON CISTERN**" 5 feet over, with  $1\frac{1}{2}$  inch down pipe, ten apples (averaging  $1\frac{1}{2}$  inch diameter) and a flat sponge about  $4\frac{1}{2}$  inch diameter were thrown into the basin. The water, as well as the whole of the exposed or dry surface, was first blackened with plumber's "smudge," and the sides covered by four pieces of thin sanitary paper, which adhered closely to the soiled surface. The handle of the cistern was then pulled, and the two-gallon flush liberated. After seven seconds (the time occupied by the discharge), a receiver placed under the trap outlet was removed, containing in the blackened water the ten apples, the sponge, and the four pieces of paper, no traces of the soil remaining visible upon any part of the apparatus.

**GOLD MEDAL AWARDED.**

THESE CLOSETS are already in use in Hospitals, Banks, Hotels, Offices, Private Residences, &c., with most satisfactory results, and, fixed in the manner described, in appearance and action leave nothing to be desired. By the novel arrangement of the supply to Basin, as shown in the sectional sketch annexed, the whole surface is well flushed and cleansed, whilst the bottom of Basin and Trap are thoroughly scoured by a concentrated rush of water which insures the instantaneous removal of the contents, thus overcoming the inherent defects in the many imitations recently produced of "**JENNINGS' MONKEY-CLOSET**" (the original form of wash-out watercloset), which was invented and patented by G. J. in 1852.

## GEORGE JENNINGS,

### SANITARY ENGINEER, STANGATE LONDON, S.E.

A VISIT TO THE SHOWROOMS IS RESPECTFULLY REQUESTED.

The ONLY MEDAL for ROOFING TILES at the INTERNATIONAL HEALTH EXHIBITION, 1884, was awarded to

## H. J. & C. MAJOR,

Late SEALY. Established upwards of 200 Years.

### THE PATENT TILE WORKS, BRIDGWATER.

Sole Manufacturers of Non-Porous ROOFING TILES, of various patterns, having C. Major's Patented Improvements, which, forming a double "rabbet" at the top, bottom, and sides of the Tiles, and avoiding cut or unprotected corners, make a secure lap that PREVENTS "WIND-STRIPPING" and ENTIRELY EXCLUDES DRIFTING RAIN AND SNOW.

Manufacturers of the Imperial Bath Scouring Bricks, Patent and other Roofing Tiles, Bakers' Oven Tiles, &c., &c.

## DAMP WALLS.

### BLUNDELL'S PETRIFYING LIQUID

Is a preparation for interior use, for the cure of DAMP WALLS. It is made in two colours, White and Red. It is applied with a brush as easily as ordinary paint, and dries hard in a few hours with a glazed surface. The many uses of such an article are obvious. As an economical substitute for White and Red Glazed Bricks, for interior walls, it is most efficient. Applied over brick, cement, iron, or wood, for the walls of passages, kitchens, schoolrooms, hospitals, and charitable institutions, where CLEANLINESS is indispensable, it will be found invaluable, as the smooth enamelled surface offers but little hold for dirt, &c., and can be washed when necessary. Used over walls before papering, it prevents discolouration, and offers a surface to which the paper will adhere firmly. Economical in cost, simple in application, and efficient in use. The proprietors recommend it with full confidence. To be obtained of the leading Paint Colour, and Varnish Dealers.

### BLUNDELL, SPENCE & COMPANY, LIMITED,

Colour, Paint, and Varnish Makers, Oil Boilers and Refiners,  
HULL, and ANCHOR WHARF, 9 UPPER THAMES STREET, LONDON, E.C.

# The Architect.

## THE WEEK.

MR. RUSKIN has announced that his resignation of the SLADE Professorship was caused by the vote endowing vivisection in the University, although when application was made for funds to build a well-lighted room for the undergraduates, apart from the obscure and inconvenient RUSKIN school, and to purchase for its furniture the two Yorkshire drawings by TURNER of *Crook of Lune* and *Kirby Lonsdale*, the grants were instantly refused on the plea of the University's being in debt.

THE Parks Committee of the Manchester Corporation do not appear to have acted generously in dealing with the Committee of the Art Museum. The latter body, after much trouble, brought together a collection of objects valued at 5,000*l.*, and they proposed to increase it until the value was double. The gift was offered to the Corporation, and accepted. Certain conditions were agreed upon, and it was decided that three large rooms were to be assigned to the collection in the new museum in Queen's Park. But the South Kensington authorities became generous in their offers, and it was found that three rooms were not available. One room was offered for the collection, and declined; then two rooms were given, with which the Committee were content, and finally an urgent request was made that the Art Museum Committee should again display self-sacrifice by renouncing one room. In the end rooms were found in the Ancoats Hall, which will be open on Sundays as well as in the evenings. It is likely that the Art Museum will not attract so many visitors in that place, but the Committee could not in justice to themselves do otherwise. The conclusion to be drawn from the transaction is that in planning museums it is absurd to think only of present necessities, and without a large margin for contingencies there is sure to be disappointment.

AN example has been set in Antwerp which deserves recognition. Every one has had his experience of the energy with which keepers of hotels and lodging-houses fleece strangers during exhibitions. The authorities in Antwerp, who wish to make their exhibition a success, have contrived to offer a protection to strangers. They have invited the inhabitants who are willing to let lodgings to furnish their names to a special committee. The houses have been examined, and those which were considered eligible have been registered. A tourist has only to inquire at the bureau in the Hôtel de Ville, and he will hear of lodgings from a franc and a half a night upwards, and for which the Municipality offers a sort of guarantee. Those who enjoy high prices can of course go elsewhere. Students can therefore enjoy RUBENS' pictures as well as the modern art in the exhibition without fear of bankruptcy.

It is anticipated in France that the French section will be the most attractive, but that is not an unusual state of mind before an exhibition opens. The Belgian pictures are well able to hold their own in a competition. It is well known that the committee of selection have been most rigorous, and hardly one in three of the pictures sent have been accepted.

WE mentioned lately that the Wolverhampton Town Council proposed to advertise for an art master for the Corporation School of Art, the salary at first to be 250*l.* per annum. One of the conditions proposed is, "that the person appointed be not permitted to hold any other appointment or to take private pupils, unless with the express permission of the General Purposes Committee," which materially diminishes the value of the appointment. It appears, however, that the master of the existing School of Art, Mr. A. GUNN, has held office for nearly thirty years, and a resolution was proposed that his claims should be first considered. By a majority of three the proposal was rejected, on the understanding that every opportunity should

be given to Mr. GUNN to become one of the candidates. There seems to be some doubt whether the superintendence of the Art Gallery should not devolve on the art master. Evidently the Town Council wish to get full value for their money.

AN Executive Committee has been formed at Peterborough on the basis suggested by the Archbishop of Canterbury in the report we published last week, viz., that the opinion of the Archbishop upon the two plans submitted to him be accepted without reference of that question to the executive committee; and therefore that the present contract for rebuilding the central tower be proceeded with at once. At a subsequent meeting of the Chapter on Monday it was decided that the architect should direct the contractor to proceed with the works according to the contract without further delay.

THE Council of the Salon rejected last year M. JULES GARNIER's picture of a Dance before ALEXANDER VI., and by doing so brought money to the painter. This year M. JULES GARNIER has, contrary to the usual practice, taken a subject from modern life, but no less sensational. The importance of a picture that will attract crowds was recognised, and *En flagrant délit* was accepted, after much discussion. But, through some higher influence, the picture will not be allowed to be hung, and it will have to be exhibited elsewhere. For political reasons a picture entitled *L'Apothéose*, representing a drunken Communist on a barricade with ROBERT MACAIRE and JACQUES BERTRAND as representatives of the allegorical figures, has also been sent adrift.

THE sculpture in the Lecture Room of the Academy comprises at least three works which as portraits merit attention from architects. The first is a marble bust of Mr. HORACE JONES, of which a plaster model was before exhibited. It is by Mr. C. B. BIRCH. Two medallions have been prepared by Mr. G. C. ADAMS. One is of the late Sir GILBERT SCOTT, and is intended for the Art Union of London. The other is of Mr. GEORGE GODWIN, and is a memorial for winners of his bursary at the Institute.

THE failure of Baron ALPHONSE ROTHSCHILD to win a seat at the Institute of France is not to be accepted as a want of urbanity in the majority. M. MEISSONIER, who inspired the opposition, was simply acting according to the spirit of French writers and artists. He is a friend of M. ROTHSCHILD, and esteems him, but he says that the banker has never been a patron of art in the ordinary sense of the word. M. ROTHSCHILD has expended colossal sums through agents in buying objects in auction-rooms and elsewhere, but there is no record that he ever gave a commission to an architect, a painter, or a sculptor for any work of importance. M. MEISSONIER happily holds a position that enables him to put his foot down and insist that a passion for acquiring *bric-à-brac* must not be confounded with a love of art. By so doing he has affirmed a truth which is more ignored in England than in France. When the painter said that he would renounce his pencil if the election went against him he was not carried away by vehemence, but by a sense of duty which can be appreciated in England, although few men here would have the courage to imitate him. It was not commissions for himself that M. MEISSONIER sought, but for architects and decorative artists. It may seem hard to say that Baron ROTHSCHILD would not be quite as good a member as the late occupier of the chair, M. DU SOMMERARD, or qualified to sit between Prince NAPOLEON and the director of the Théâtre Français. But men, whether great or humble, must be judged by their capabilities and opportunities, and by that test M. HEUZEY seems preferable. Better to have a scholar at the Institute who has been absorbed by figurines and Greek drapery during his life than the NIMROD of curiosity hunters. If Baron ROTHSCHILD, who has acted throughout in a way which has been faultless, will but interpret the voting rightly, he can easily turn defeat into a victory. The position which M. MEISSONIER suggested for him, that of being the MÆCENAS of French art, is even more exalted than a membership of the Institute.

## ARCHITECTURE AT THE ROYAL ACADEMY.

THIS year's exhibition of architectural drawings is likely to excite more than the customary discontent. It was expected that when one of the new rooms had been assigned to architecture alone, the additional wall space would allow of the hanging of so many drawings as to remove all cause of grumbling, unless among unreasonable people. There are more drawings than usual, for the numbers begin with 1,740 and end with 1,966, consequently over 220 drawings are to be seen, while there were only 140 last year. If they all represented contemporary architecture, the only objection that could be raised against the exhibition would be the smallness of the room. But when we analyse the numbers we discover that there is not much improvement in the arrangements, and the exhibition has a lesser claim than formerly to be considered representative.

In the first place, we have about fifty drawings or sketches of old work. We are as great admirers of antiquity as the Academicians who arranged the room, but until we find casts of Mediæval figures in the sculpture gallery and copies of works by early masters among the oil paintings, we shall maintain that it is contrary to the idea of an Academy to have the drawings which show the buildings designed by living architects supplanted by sketches of ruins. While architecture had no more than a share in a room, it might be inferred by the public that the absence of the works of so many architects was due to the limited space, but now it can be said that modern works are not worth exhibiting, and the Academicians are therefore compelled to fall back on the past. It will also be found that there are at least twenty designs which belong to industrial art rather than to architecture, and consequently a reduction of about one-third must be made from the number of drawings before the value of the concession can be estimated. To put the matter briefly, additional wall-space has been granted, but works which should be elsewhere are more than sufficient to fill it.

It must be said that the Academicians and Associates have not appropriated much of the space to their own designs. Mr. NORMAN SHAW and Mr. BODLEY do not exhibit; Mr. PEARSON has half a dozen drawings, which cannot be called large; Mr. AITCHISON has two small drawings; Mr. WATERHOUSE sends only one. An Academician painter has an outline drawing to show his proposal for the decoration of the dome of St. Paul's, but no one would object to the appearance in the gallery of any design by an artist like Mr. ARMITAGE, who has sacrificed much in order to convince people that wall decoration is practicable in England.

The collection begins with a Gothic church in Liverpool by Messrs. HADFIELD & SON, which is placed too high for study. Apparently the columns are of sandstone, and the interior has more warmth than is usual in cheap churches. Below it is the *Shakespeare Memorial Tower, Stratford-on-Avon*, by Mr. UNSWORTH, which forms the best part of an effective building. The arch over the roadway, the porch, steps, and tower combine to form a whole which may well be called picturesque. Mr. FLOCKHART has two drawings of a house and studio in St. John's Wood for his fellow-countryman, Mr. MACWHIRTER. They show one of those long, low buildings of which many examples are to be seen in the room. In this case we have good grouping. Messrs. HADFIELD'S *Business Premises, High Sheffield*, represents one of the few large blocks which have been lately carried out in Sheffield, although few towns have greater need of buildings of that class. *Beckley Church, Sussex*, by Mr. R. T. BLOMFIELD, is an interior showing a low chancel arch of large span. A finial from Clermont Ferrand gives a good notion of Mr. BLOMFIELD'S skill as a draughtsman. Mr. W. STIRLING'S *Design for a Library for a Small Town* deserves to be carried into execution. The materials are of stone and red brick. There is an arcade. Busts are introduced, and a figure of Wisdom; but nothing is seen which fritters away the effect or suggests a miniature of a large building. It is not often that such a recognition of scale is to be found in a building of the size. The *House and Observatory, Rusthall*, by Messrs. SALOMONS & WORNUM, is skied. The architects have attempted a difficult problem

in endeavouring to be picturesque while attending to the astronomer's requirements. In his *Study for the Centre Block of a Public Building*, Mr. PHENÉ SPIERS has a noble example of French Renaissance, which is unfortunately never likely to be produced in any other form in this country. It will bear comparison with the best pavilion of the Louvre. Sculpture has been utilised with judgment, but the line of swags over the lower storey detracts from the remainder of the work. The competition for a church at Whitby gave rise to disappointment; all the designs were, we believe, set aside, and Mr. JOHNSON, of Newcastle-on-Tyne, was asked to prepare one which is now in the Academy. The principal feature is the massive battlemented tower, but the whole design has a Northumbrian character. In Mr. BAKER KING'S *Church for Ceylon* no attempt has been made to introduce an eastern element; we have a simple English village church with a broach spire. A few years ago Mr. PURDON CLARKE, of the India Museum, made the experiment of slightly modifying the windows of an Indian church, in order that it might be more in keeping with the surroundings, and it might be well to show the pliancy of Gothic when English churches are erected in the east. There are three drawings of Mr. SEDDING'S *Proposed New Church in the Diocese of Ely*. A large fresco is seen in the chancel, and iron suspension rods are freely used in the construction of the roof. Messrs. BELCHER show their additions to *Stowell Park* by two geometrical drawings. Mr. E. G. HARDY has three clever sketches from Italy. Then we find two important designs which are placed too high. One is Mr. J. O. SCOTT'S *Reredos in Canterbury Cathedral*, and the general effect only can be observed. The detail, on which everything depends, is lost. Mr. COLLCUTT'S new premises in Oxford Street show a praiseworthy attempt to use arches for nearly all his window heads, and to suggest a sufficient support for the superstructure above the wide openings of the shop windows. Messrs. CHARLES SMITH & SON, of Reading, have a large mansion, *Arborfield, Bucks*, which is a good example of provincial work. Mr. T. G. JACKSON is fortunate in having five drawings of important buildings. The first is met with on this wall, *The Quadrangle, Trinity College, Oxford*, and the architect's aim is to be in keeping with the surroundings. We find one of Messrs. ERNEST GEORGE & PETO'S four drawings here: the whole will shortly be published in *The Architect*. Mr. E. J. MAY has two views of a house at *Wimbledon Common*, marked by his usual facile handling. The best compliment we can pay Mr. J. A. SLATER for his large view of the cathedral at Le Puy, is to say that at first sight it appears like a work by the late F. C. DESHON. Mr. VACHER has two small views of a house at Elstree, but they have been placed aloft in company with a view of the library at Gray's Inn, by Messrs. FLORENCE & ISAACS, which appears to be well adapted for its purpose. Why important works should be placed out of sight and students' sketches on the line are questions which we are unable to solve, but apparently much of the hanging was left to the discretion of the Academy porters. In the competition for the VICTOR EMANUEL Memorial, at Rome, Mr. DANIEL BRADÉ, of Kendal, attained much success by his proposed restoration of the Pons Sublicius. A large view appeared in the Academy a few years ago, and another is now seen, which, like the former, shows an appreciation of Roman work. Messrs. DOUGLAS & FORDHAM are represented by the *Institute and Baths, Tamworth*, which is a model of what a work of this kind should be in a small town. On this wall are two good sketches by Mr. REGINALD BARRATT.

The adjoining wall has been selected for the exhibition of four drawings by Mr. PEARSON, R.A. Two represent the St. Peter's Convalescent Home, at Woking, with a fine tower, which we hope may not be considered too costly for such a building; and in two others we have the central tower for Peterborough, about which so much has been spoken by rival authorities. The latter is worthy of Mr. PEARSON'S great reputation for towers, and it will be a loss, if, through expediency and a desire for conciliation, so stately a work has to be sacrificed. Mr. BLOMFIELD has a good drawing, showing his proposed restoration of the front of the south transept at Chester, in which abundant use has been made of statuary. But the most important of all the drawings, in this part of the room, is the coloured

view of the National Liberal Club, by Mr. WATERHOUSE. The originality of this building is unquestionable, but it is only when seen as here represented that an idea of its power can be formed, and when completed it will be sure to exercise an influence on street architecture. Mr. BASIL CHAMPNEYS' two views of the Indian Institute are not good as drawings, and the building would have looked better in perspective. The house, *No. 59 Jermyn Street*, by Mr. JOHN ROBINSON, is a well-considered example of Italian, which, by contrast, makes the style of some buildings near appear flimsy, and it is needless to say the drawing is excellent. In *The Martyn Hall, Cambridge*, by Mr. E. S. PRYOR, a good deal is made of the stairs, although the wooden enclosure underneath detracts from the great vigour of the remainder of the work. The *Design for a Town Gate-house*, by Mr. DAWBER, is executed in the style introduced by Mr. ERNEST GEORGE, that is, line with a light sepia wash. As a design it augurs well for the artist. Mr. LEE, in his *Gower's Walk Schools, Whitechapel*, makes use of brick pilasters effectively, and the building is in keeping with the old-fashioned work that is to be seen in the East End. Mr. SEDDING has a capital drawing of *St. Saviour's Church*, in which the vicarage is worked skilfully into the composition, and a large working drawing of a crozier. Mr. HERBERT GREEN in *Burnham Thorpe Church* suggests that the roof is the more important part. There is a large mansion by Mr. BRYDON, *Pickhurst, Surrey*, of which another view was seen last year. Messrs. CHRISTOPHER & WHITE's *West Hoathley Inn* is a vast improvement in buildings of that class, which unhappily are generally produced without any other thought than vulgar effect. Mr. MOUNTFORD's *Vicarage, Forest Hill*, is a small but pleasing building. Among the houses worth notice are Mr. RICARDO's *West Gates* and Mr. FERGUSON's *Carton Tower*. Mention should also be made of Messrs. GOLDIE & CHILD's *Roman Catholic Church*, and *Hatchett's Hotel* by Messrs. WEATHERBY & JONES.

On the largest wall prominence is given to Mr. PEARSON's views of *Westminster Hall* and the *Constitutional Club* by Mr. EDIS. The design by Mr. ASTON WEBB and Mr. INGRESS BELL for the proposed *War and Admiralty Office* has a central position on the west wall, and is the only one of the premiated designs which is to be seen in the exhibition. Are we to assume that, in the opinion of the Academicians, it was most deserving of selection? Messrs. LEEMING are represented by a design for the *Brisbane Town Hall*. On the western part of the north wall the most important drawings are Mr. ARMITAGE's design, the views of the *Military Hospital* by Sir ANDREW CLARKE and Mr. BELL, and the large drawing of Messrs. HADFIELD's *Corn Exchange Buildings at Sheffield*.

### THE GROSVENOR GALLERY.

WHETHER by accident or arrangement, there is generally one artist who is paramount in the exhibitions at the Grosvenor Gallery. This is Mr. WILLIAM RICHMOND's year. Mr. BURNE JONES is absent, Mr. WATTS appears weary, Mr. WHISTLER is demonstrating in Suffolk Street that black on black is not false painting, and Mr. WALTER CRANE seems to have puzzled himself with his allegories. We do not wish to detract from the merit of Mr. RICHMOND's largest work; but, while we are grateful to him for enriching the exhibition with one of the two pictures that are likely to be memorable, we must say that this year it is not very difficult to obtain the victory. It would be better for the artist's reputation if his painting had been placed in competition with works of a different class from those in the gallery.

The picture is called *An Audience in Athens during the Representation of the "Agamemnon."* The title will suggest that it is one of those paintings in which we see an effect and have to imagine the cause. They are dangerous experiments to undertake. The spectator is placed, as it were, in front of an audience of fifty or sixty people, who are nearly all gazing intently in one direction and are impressed by one influence. They are supposed either to be startled by the sudden cry of AGAMEMNON when his queen kills him, "like an ox in his stall," behind the scene, or to hear the

story of the murder as it is told by CLYTEMNESTRA to the chorus after the doors were suddenly opened and the murderess was seen standing by the side of the corpse. The emotions which are excited by the scene are different. The old choragus who is in the centre is as a host should be—master of himself; the men who are falling into the sere and yellow leaf, like AGAMEMNON, are revengeful in their sympathy; some women are scared, one galled jade appears to suffer remorse, and avoids the sight by hiding her face with her hands. With the exception of the slaves who wait on the choragus, and who are expected to be impassive, everyone is moved. The appearance of the spectators is a tribute to the tragedy and the poet's power. There is not one of those discordant notes such as some of the figures which GEROME has introduced in his *Phryne*, and which would be expressive of irreverence or weariness. The artist is not ambitious to introduce unnecessary contrasts; he shows the people made kin by the one touch of nature and no more. The majority of the men wear red robes—a colour which is trying when it has to be often repeated. Mr. RICHMOND has frankly accepted the difficulty, but has toned down the colours by occasional borders of figures. He has the authority of the great book on Greek textiles which the Russian Government produced for this treatment. It may be objected that there is less authority for the theatre. We see three tiers of stone seats, and, if completed, an enclosure of the size would probably contain a hundred spectators. We know that the Greek theatres were large, and we must imagine the one which is depicted to be a private theatre, surrounded by Ionic columns (through which we can catch a glimpse of the Acropolis), with sculpture along the base of the *Bouleutikon* and a saffron curtain over all. LYSICRATES may have had his rehearsals in such a building before he allowed his troupe to compete for the tripod. The picture has been well thought out and is carefully painted. Every one of the faces is marked by individuality, and so large an amount of character painting is rarely seen in any modern gallery, much less in the Grosvenor, where qualities of a different kind are in esteem. In addition to the large *Agamemnon*, Mr. RICHMOND has ten paintings, mostly portraits, and suggestive of his power to represent men, women, and children. The portrait of *The Hon. Lady Loyd Lindsay* is an able work of a lady in black, whose grey hairs appear to be encircled by a wreath on the tapestry behind; this is an arrangement that required judgment or there must have been a sacrifice of dignity. The two portraits of the Misses WORMALD are open to the objection that the subjects are posing, but the faces, dress, and background are in keeping. In the portrait of *Mr. Andrew Lang*, the artist, on the contrary, has avoided all trace of conventionalism—the writer looks as if he had been taken unawares when he turned from his cabinet of figures. The portrait is one of the most attractive in the gallery.

Next to Mr. RICHMOND's, the picture which has a claim on most attention is the nude figure of *Hypatia*, by Mr. C. W. MITCHELL. The subject is taken from one of those high-pressure scenes which the vehement CHARLES KINGSLEY poured forth when he wrote historical romances. The young Alexandrian, whose orthodoxy was doubtful, is at bay in the Christian church, and, standing against the altar, appeals from the men at whose hands she was about to meet her death to the figure of CHRIST that was above her. There is no questioning the power of the scene. This is no French nudity, but a martyr. We see the spirit of the heroine joined to a woman's weakness—the scorn which a teacher of philosophy must have had for the rabble who could hunt her down, and the despair which comes from helplessness when one has to contend with a multitude. The artist's name is strange to us, but the painter of a figure like this should have a great future before him.

Mr. WATTS's pictures must always command reverence. The painter would, however, be probably the first to acknowledge that the nude figure in *Love and Life* will not bear comparison with the *Hypatia* at the opposite end of the room. *Love and Life* may be said to be an idealisation of a pair like DAVID COPPERFIELD and his child-wife DORA, but it must be confessed that little is gained by the invention. The girl is feeble in body and face, and is led up fantastic rocks by a mawkish youth. There is no knowing whence they came and whither they are going, or the use

of such large wings, unless to aid the owner. The flesh tints are as remote from life as the subject. *Ararat* is a picture of a blue mountain-top in a deep blue sky, where a single star is shining. It has all the solemnity that befits the subject. Among Mr. WATTS's portraits we prefer *Miss Rachel Gurney*, a lady in black leaning against a golden background.

Mr. ALMA TADEMA is represented by two small but exquisite paintings and a portrait. In *Who is it?* we see a Roman lady looking over a marble screen, while *Expectations* shows a young girl seated on one of those carved marble seats which the artist admires, and gazing across the sea. The latter figure is most pleasing: there is a girlish simplicity about the face which is a change after so many imperial faces. The marble in both is rendered in a way of which Mr. ALMA TADEMA has the secret. There is a portrait of a doctor, or consulting physician, seated at a bedside feeling a patient's pulse, and eagerly looking towards some person who is unseen. The head is painted with smooth vigour, but whether owing to the novelty or the arrangement, it is not pleasant. Mr. ALMA TADEMA is fond of making a part stand for a whole, and here we have simply hands and a white sheet to suggest an invalid.

As usual, there is an abundance of portraits. Mr. MILLAIS sends a striking half-length portrait of Mr. GLADSTONE, who is shown wearing the red gown of a doctor of laws. It is hardly the Premier as he now appears, worn with toil and disappointment, and late hours, but rather as we might suppose him to be after a holiday a few years ago. The face seems more massive than the original, and as a likeness we prefer the portrait which Mr. MILLAIS exhibited in the Academy. But the colouring, although very thin in parts, has more precision than is usual with the painter. It is unfair to compare such a master's work with one by a young artist, but a student would do well after looking at the red robe to cross the gallery and contemplate the crude red and purple that are seen in Mr. BROWNING's portrait of his father. The contrast will be suggestive of an elementary truth in painting. A portrait of Miss MARGARET MILLAIS might be taken for a work that was painted several years ago, for it has qualities that Mr. MILLAIS rarely exercises now. Mr. HOLL has two portraits of similar size, which are placed almost close together—*The Late Lord Overstone* and *William T. Palmer, Esq.* It is not easy to see why there should be such a difference between them. Over the portrait of the old banker-lord is a plate of glass which, owing to the dark colour in parts, reflects the entire gallery, but in spite of the disadvantage it appears to be the better of the two. It has more depth, contrast, and character. Can it be that the artist was more satisfied with the subject of one picture than of the other? Mr. HERKOMER shows his customary vigour in the portrait of Mr. STANFORD, the composer. The flesh tints, however, suggest that the artist restricted himself to browns when preparing his palette. Mr. P. R. MORRIS in his *Miss Kate Sergeantson* represents a young lady who is apparently taking her first lessons in dancing. Mr. C. E. HALLÉ has among others a portrait of his father in a doctor's gown. He renders the calmness which is supposed to characterise the pianist; but any one who has observed Mr. CHARLES HALLÉ closely, either in St. James's Hall or in Manchester, would say that it is accompanied by more mental vigour than is to be found in the picture. We have always taken the placidity to be a recognition of the nature of the piano, and in our day no *maestro* has done so much justice to the instrument, no one has come nearer to the ideal pianist than Mr. CHARLES HALLÉ. In the picture quietness has become reverie. A much better work is *Pets*, a portrait of a boy with gold fish. Mr. JOHN COLLIER's *Lady Lorraine* is a vivid portrait; the dress is nearly white, and the lady carries a flat basket full of violets. Mrs. JOPLING's *Little Bo-peep* is also apparently a portrait of a child that was not kept in position without trouble. In Mr. STUART WORTLEY's *Miss Maud Waller* there is an air of defiance that is we suppose esteemed by the young lady's friends; face and dress have been well rendered, and the scheme of colour, a soft creamy yellow and deep crimson, is pleasing. Mr. HOLMAN HUNT's *Bride of Bethlehem* is a head of the lady who is seen in the artist's picture in Bond Street. It is needless to say that every detail of dress and trinkets is rendered with conscientious care, but the pink cheeks are

a departure from nature, and the picture requires a more distant point of view than is possible at present.

Historical subjects are supposed to be antiquated in the Grosvenor Gallery, and the figure-pieces are mainly of everyday life or of abstractions. Mr. STAPLES ventured to send a picture of CLEOPATRA engaged in toxicological experiments with slaves and adders, and the height at which the picture has been hung indicates his reward. The Egyptian queen is lying on a couch, and a powerful slave on whom the snake has operated is stretched before her. The subject is a good one, and deserved to be treated on a larger scale. Work of this kind—which is evidence of a study of the figure—is more worthy of recognition than many which may be said to depend for attraction on sentimental titles, and which are obtruded by their prominent positions on visitors to the gallery.

It is a relief to turn from those paintings to the out-of-door scenes which have been inspired by Mr. HOOK, R.A. Mr. BARTLETT's *Practising for the Swimming Match* is true to nature. The boys are boyish, while the boatmen have the weight and stolidity with which retired mariners are endowed. The colour is excellent, and although Mr. HOOK might have painted the figures, he would probably decline to introduce the yellow drawers, on the ground that it was an imitation of a foreign practice of contrasting colours. Mr. MACALLUM's *Lass that Loves a Sailor*, in which a party of humble folks are being rowed towards a brig, while one girl waves a handkerchief in anticipation, is an everyday scene, but bright and refined. The fleet of fishing-boats that is seen on the right fills an awkward space, and helps in giving the impression that the artist has not made too much of his incident. Another version of the subject—but far more commonplace—is given by Mr. PARTON in *It may be for Years, and it may be for Ever*. Green always looks best when it gives relief to one's eyes near the sea. Mr. DAVID MURRAY's *'Twixt Croft and Creel* on that account alone is sufficient to attract, for it shows a few fishermen mending their nets in a field. There are nets hanging to dry on the poles, and thrown into most graceful lines. In the treatment of this picture a lesson has been taken from French works. Foreign influence is likewise seen in Mr. CHRISTIE's *Time of War*, in which we have a woman in black holding a baby and standing on grass that is, if anything, over-verdant. No attempt is made to exaggerate her grief, and the limitation of the colour is in keeping with the scene. No less successful, although very different in the range of its colour, is Mr. WEGUELIN's *Egyptian Difficulty in the Time of Augustus*. The pashas are represented by a troupe of ibis, but no less convinced of the advantages of a policy of masterly inactivity. The girl who conducts the performance is vainly endeavouring to persuade one to fly through a hoop, while it is evident that an incentive of another kind is necessary, unless there is to be a retirement. The performance takes place in a Roman palace; but we must not expect to see marble and bronze in the background like Mr. ALMA TADEMA's.

The Grosvenor standard for acceptance is elastic enough, and we can generally find one picture at least which excites wonderment, just as the apple in the dumpling did with King GEORGE. Let any spectator look at *The Bridge of Sighs*, and the question must arise—How did it get in? We could point to others no less remarkable. They may be supposed to serve as foils for the works near them, but the blank wall space would be preferable for that purpose.

Among the landscapes there is no one work like the *Minister's Garden* of old, which will be a subject for talk throughout the season. Mr. KEELEY HALSWELLE has a good study of clouds, mist, and water in his view of *Kilchurn Castle*. But, contrary to the usual practice—for few scenes have been so often painted—we see very little of the expanse of Loch Awe, which makes the solitariness of the ruin more impressive. Signor G. COSTA has undertaken the difficult task of painting a wave on a shallow shore, and evidently from a southern sea. Waves of a different kind are to be seen in Mr. HOLLOWAY's *Harbour Bar*, in which the power that is latent is well suggested. Mr. HERKOMER's *First Warmth of Spring* is a splendid study of a mountain side, where the rocks may be said to lose their coldness, but the sheen of the stream has escaped from the canvas if it had been ever there. Two landscapes in the second room are so well contrasted that

they might be taken as companions. Mr. HELCKÉ's *Noontide's Heat and Hush and Shine* represents the landward view of a seaside village on a flat coast, the grass having that peculiar green which is seen nowhere else. Mr. BENSON also shows an expanse, but it is of a lagoon, on which one boat appears, while overhead are great masses of cumuli. Mr. JAY's *Valley of the Teme* is a charming landscape, all the more attractive owing to the scarcity of pictures of trees in the Gallery. Mr. BOUGHTON shows trees in his sketch called *Salmon Fishing in the Beaulieu River*, but we miss the delicacy of leaf and branch that belongs to northern plantations.

It must be owned that the Grosvenor Gallery does not uphold its reputation for presenting thoughtful works which might be in advance of the requirements of the Academy Council. To a certain class of people everything which is seen on the walls is supposed to be worthy of distinction, and to have an undefinable but most precious amount of originality, for in no other gallery is more of foolish praise to be heard in the course of a season. This year's exhibition may suggest that there can be fruitless seasons in Bond Street as well as in Piccadilly, and the knowledge, in spite of its unpleasantness, need not be without a good result. One thing is evident, that already there are indications of a necessity for reform in the gallery.

### THE ALBERT PALACE.

THE exhibition building in Dublin, which was designed by Mr. R. M. ORDISH, was a rather remarkable example of iron construction. Owing to the site being required for buildings for the Royal University, the iron girders and columns were sold to a company, and have been re-erected in Battersea on ground belonging to Her Majesty's Office of Works. It suggests the state of affairs in the profession when it is found that the whole of the work was executed without any consultation with the original designer.

The prudence of letting the site to a limited liability company has been doubted, for exhibition buildings are not always profitable ventures in this country, and it would be a strange sight to see the Whitehall officials compelled to take charge of a music-hall. But as Battersea Park is known to attract visitors, especially those belonging to the humbler classes, from many parts of London, it was a becoming act on the part of the First Commissioner to brave the risk of a loss to the Exchequer when there was a possibility of increasing the means of innocent recreation. Battersea is so readily approached by rail, river, and road that it becomes one of the most accessible places about the metropolis for a concert-hall and exhibition galleries.

The building is sufficiently spacious to form a promenade, the nave being nearly 500 feet in length, with a width of 80 feet and a height of 60 feet. As the upper part is constructed of glass and iron, there is abundance of light. The decoration has been executed under the direction of Dr. DRESSER, in the style which he can claim as his own. The glass of the roof has been painted yellow, with strips of blue at intervals. The cast-iron columns are of dark blue, with light blue on the chamfers. When the sun shines the light in passing through the yellow panes impinges on the columns, turns the blue into green, and produces a good effect. The girders are dark blue, with stencilled ornament in white on the webs. The walls are of a yellowish green, with a deep red in the arched recesses. Vermilion is used in the soffits of a part of the railing around the gallery. The scheme of colour is ingenious, and at present is agreeable, although there is the drawback of an empty building. In the concert-hall there is a somewhat different arrangement, and the style appears here to be too severe. The organ fills the whole of one end of the transept. The brown and black, in which the geometrical decoration has been worked out, give an Egyptian grimness to the instrument. The details are as logical as mathematical propositions, but in these degenerate days pleasure-seekers will not take delight in gazing on diagrams. The rigidity of the metal in the pipes has been emphasised by means of paint, and a tired Londoner will find that there has been no concession from the strictest theory to give him relaxation. The chorus-singers with such a background hardly seem to be simple amateurs of an unoffending nature. In

cases of this kind it is always well to ask, What would the French do; for, as they have devised more pleasures than other people, they should know how to decorate a concert-room. We may safely assume that in the hands of a Paris artist the Battersea organ-hall would be rendered more attractive, if less in accordance with the canons of OWEN JONES. The organ in the hall is a splendid instrument, and, when its power of sound is fully exerted, never seems to be harsh. That it should have been originally constructed for an amateur suggests the influence of organ music in this country.

The "Connaught Hall" is a vast dining-room parallel with the nave. Here use has been made of the Corinthian columns in white and black marble which at one time formed a part of Baron GRANT's big house at Kensington. The conservatories have been also purchased, and one of the peculiarities of the palace is the second-hand character of the materials. It is not possible under these conditions to produce anything which has a claim to be called architectural, and, so far as we can infer at present, the economy has not been attended with many advantages. A vamped building does not appeal to the pockets of investors, for it cannot fail to recall that fateful word "demolition," and to suggest that what has occurred once may again take place. It was a significant statement of the chairman, Sir ROBERT CARDEN, that he did not expect pecuniary profit. But if the building possessed that character which is only to be obtained by the means of an original design, we see no reason why it should not afford a more hopeful prospect, especially as the Office of Works is a considerate landlord. We do not believe in the success of undertakings which are inspired partly by philanthropy and partly by profit.

### TESSERÆ.

#### Restoring Towers.

SIR GILBERT SCOTT, R.A.

BE assured that no amount of shoring can be too much for safety, no foundations to your shoring too strong, and no principles of constructing it too well considered. (2) Use the hardest stone for your new work which you can procure, and spare no pains in bonding it and tying it together with copper. (3) Be very slow in your operations excepting at critical junctures, when the very contrary is necessary; be careful in your principle of movable supports; as you cut away old work set every stone in the very best cement, and run in the core with grout of the same material. (4) Key up well at the top, and leave your shoring a long time after the work is done, and then remove it with the greatest care. (5) (Though more properly first.) Tie your tower well together before you begin, and take special care of your foundations. Above all, have a thoroughly practical clerk of the works—neither too young nor too old. The shoring must be all of undivided timbers, and often of four or more such balks, bound and bolted together into one by irons.

#### Italian Painting.

SIR DAVID WILKIE, R.A.

To those who have seen art in its declension, it is interesting to observe the qualities which distinguish it in its infancy and its manhood. The works of Cimabue and Giotto, humble almost as the Chinese and Hindoos, had yet the living principle of expression and thought which, down to the time of Masaccio, furnished their only means of arresting the sympathies of man. The refinements of foreshortening, of contrast, and of intricate composition, with which the followers of the Caracci have so encumbered art, were to them impossible. In sentiment alone they excel. To this they appear to owe their advancement, and to this even the mighty men who brought art to maturity appear to owe their pre-eminence. The great works of Raphael and Michel Angelo in Rome (my chief study) evince this in a high degree. No artist can either be so high or so humble in his aim as not to be benefited by their contemplation. The divine Raphael, indeed, though shorn by time of his original freshness, all can understand, and all would wish to imitate. With Michel Angelo it is different; his works, incapable of being repaired or refreshed, present with their high reputation a great enigma to most people. Dulled with smoke and natural decay, the admired contour and relief, the great inspiring cause of grandeur and of deep thought, which Raphael imitated, and which drew forth the dying eulogism of Reynolds, is lost entirely to the common eye; and it is only by making allowance for these that the artist can see their great qualities, and, combined with them, what I least expected to see, a refined light, shadow, and colour.

**Greek Love of Form.**

PROFESSOR JEBB.

The Greeks were a physically beautiful race, with great quickness and fineness of perception, which made them feel at once when anything was exaggerated or absurd—or, as we say, in bad taste. One of their favourite maxims was, "Do nothing too much." They were naturally obedient in all things to a sense of fitness and measure—what they called "kairos," a word which means literally precision, the instinct of drawing the line, as it were, at the right place. So when they built a temple this instinct kept them from making one part of it too large in proportion to another, or from adding ornament in the wrong place. And this is the reason why such a building as the Parthenon at Athens, with its noble simplicity and symmetry, is so perfect of its kind. Or if a Greek made a statue, not only did he make the limbs and features on just the right scale for each other, but he refrained from trying to make the stone express more than it fitly could, or do duty for a picture. In the same way, when they wrote books the Greeks were guided by their sense of fitness. They felt that it was out of proportion, and therefore ugly, if the words were grander or rarer than the thoughts, and that a style which might be fitting in one kind of composition would be out of place in another.

**The Cathedrals of Leon and Beauvais.**

G. E. STREET, R.A.

When Leon Cathedral was planned, its architect must either have resolved that it should exceed all others in the slender airiness of its construction, or he must have been extremely incautious if not reckless. It is not a little curious that in France, at the same time, the same attempt was being made, and with the like result. The architect of Beauvais, unable to surpass the majestic combination of stable loftiness with beauty of form which characterised the rather earlier work at Amiens, tried instead to excel him alike in height and in lightness of construction. No one can pretend that he was an incompetent man, yet his work was so imprudently daring that it was impossible to avoid a catastrophe; and we now have it rebuilt, to some extent in the same design after its fall, but with so many additional points of support as very much to spoil its symmetry and beauty. Here, then, we have an exactly parallel case; for at Leon, no sooner was the church completed than it became necessary to build up the outer lights, both of the clerestory and triforium, to save the work from the same misfortune. Nor was the precaution altogether successful, for, owing almost entirely to the over hazardous nature of the whole construction, the south transept had recently, it is said, become so dangerously rent with cracks and settlements as to render it absolutely necessary to rebuild it; and the groining throughout the church shows signs of failure everywhere, and this of serious, if not of so fatal a character.

**Assyrian Colours.**

WILLIAM LINTON.

The colours which have revealed themselves during Layard's excavations at Nineveh display sufficient evidence that they are not inferior to those of the ancient Egyptians, either in number, variety, or brilliancy. Instead of the common earthy bole or reddle of the latter people, the Assyrians have left us a colour almost equal to vermilion itself. The monochrome pictures which represented the Chaldeans on the wall (Ezekiel xxiii. 14), are said by Gensenius, the Septuagint, and the Vulgate to have been painted with sinoper or rubrica, a native earthy oxide, like Indian red; whilst both the great English versions of the Bible now in use, as well as the rabbis, translate the word at issue ("shashar," Jeremiah xxii. 14) vermilion. At Khorsabad it appears that the red approached in hue to that brilliant colour, while the sculptures at Nimroud exhibited a bright crimson or lake tint. Layard thinks there is no doubt of their having made great use of vegetable colours, the materials for which are so plenteous in the vicinity of Nineveh. The rapid evanescence of some specimens of blue and red on plaster, which were bright and perfect in colour when first exposed, would appear to favour a vegetable origin, as no susceptibility of the kind is known to characterise any mineral reds or blues with which we are at present acquainted. Layard claims for the older Assyrian period the same colours which have been attributed to the early times of the Egyptians, viz., blue, red, yellow, black, and white. He also speaks of a green on the earlier monuments of Nimroud, and of green, purple, violet, brown, &c., enamelled in paintings of figures on bricks at the north-west palace. In allusion to the analysis of Sir Gardner Wilkinson's specimens of the Alexandrian blue, by Dr. Ure, Layard conjectures that the colouring principle may be the same, but affirms that the Assyrian blue is much brighter. He concludes that the colour was derived from copper, as he found an old mine of that ore in the neighbourhood of Nineveh. Layard considers the greens of Assyria to be similar to those of Egypt, which are in many instances

composed of iron ochre and copper blue. The yellows and blacks, also, he conceives to resemble those from Egypt; and as specimens of the latter class of pigments he mentions calcined bone and black iron ochre. The whites are of alabaster and gypsum. At Khorsabad, the French antiquarian, M. Botta, found green, red, black, white, yellow, and blue—the latter very lively in colour.

**Whewell as a Writer on Architecture.**

A. J. BERESFORD-HOPE.

At the time when Dr. Whewell came forward as an architectural writer, his previous studies enabled him to do so with peculiar usefulness. Up to that time architectural authorship, so far as it was not the occupation of the professional architect, was too much the mere amusement, often trifling or fantastic, of the amateur whose stock-in-trade was a repository, more or less restricted, of traditionary axioms of taste, unballasted either by sufficient archaeological research or sufficient knowledge of constructional requirements. Three books which appeared simultaneously, all of them by amateurs of a stamp different from the non-professional writers of earlier days, contributed a powerful impulsion to that wider philosophical analysis of universal architecture which is the note of our age. These were Thomas Hope's posthumous "History of Architecture," Professor Willis's work on the "Mediæval Architecture of Italy," and Dr. Whewell's volume on "German Churches." The fruit of the mathematical and mechanical training, which is the necessary discipline for high wranglership at Cambridge, was manifest in the powerful analysis which the last-named book contained of the hitherto imperfectly known science of vaulting, and other practical constructive questions. No other book on architecture, except a new and enlarged edition of this work, ever appeared from the pen of the Master of Trinity, but occasional papers showed that his love for architecture had not waxed faint.

**Nature and Pictures as Teachers.**

JOHN CONSTABLE, R.A.

In art there are two modes by which men aim at distinction. In the one, by a careful application to what others have accomplished, the artist imitates their works or selects and combines their various beauties; in the other, he seeks excellence at its primitive source—nature. In the first, he forms a style upon the study of pictures, and produces either imitative or eclectic art; in the second, by a close observation of nature, he discovers qualities existing in her which have never been portrayed before, and thus forms a style which is original. The results of the one mode, as they repeat that with which the eye is already familiar, are soon recognised and estimated; while the advances of the artist in a new path must necessarily be slow, for few are able to judge of that which deviates from the usual course, or are qualified to appreciate original studies.

**French Joinery.**

J. W. HUGHES.

Joiners' work in Paris is defective in its construction and roughly finished. French joiners have apparently no idea of wedging up a piece of framing. In framing a room door with stiles 4 inches or 4½ inches wide, they would not carry their tenons through the stiles and wedge up the frame as would be done in this country, but their tenons would go only half way through the stiles and be fastened with pins. This system of pinning, which is a favourite one with the French, is considered very objectionable in this country, as the head of the pin never fails to project beyond the face of the work as it shrinks. In making sashes and other framing with narrow stiles in which the tenons are carried through the stiles, we saw no attempt to wedge, but everywhere we found even the best of their work disfigured by the unsightly pin. We met with no mortises more than 3 inches deep. In framing doors all their rails are made the same width as the stiles; wide middle and bottom rails are unknown. Large doors have frequently two narrow middle rails, placed from 6 inches to 9 inches apart. The consequence of such defective construction is that the doors in Paris almost invariably drop on the outside edge. This any one may observe who will take the trouble of looking along the edges of the rails of a pair of folding-doors in any part of Paris, when in 99 per cent. of them the doors will be found to have dropped from their proper position. In fact, we may say that, under their present system, it is impossible to construct a heavy door capable of bearing its own weight and retaining its proper shape, with its stiles and rails at right angles, unless braces be introduced to prevent it from racking. This defect seems to have occupied the attention of the French workmen, and at length, as far as sashes are concerned, it has been overcome. Some genius has discovered that what cannot be managed with wood only may be made easy with a combination of wood and iron; and now we find that the sashes of the New Opera House are strengthened and at the same time disfigured by iron squares screwed on the angles.

*The Fitch of Bacon*  
By Thomas Stothard R. S.

Nº 26 ST. JAMES' SQUARE, LONDON.

GEORGE AITCHISON, A.R.A. ARCHITECT.

## ILLUSTRATIONS.

NO. 26 ST. JAMES'S SQUARE.

THE building we illustrate is so nearly completed as to be in the house-agent's hands. The conditions of the problem were difficult. The site is narrow, and on one side is a large club-house. Mr. AITCHISON has, however, been able to produce a building which forms a marked feature in St. James's Square. The terra-cotta sculpture has an artistic effect which compensates for size, and contrasts well with the Mansfield stone in the lower part of the building. No better testimony could be found of the improvement which is taking place in London streets than is afforded by a comparison of the new house with those which adjoin it. If people who decry modern architecture would visit St. James's Square for the purpose, they might begin to doubt their own wisdom.

## THE FLITCH OF BACON.

THE illustration which is published in *The Architect* this week is larger than any plate that has hitherto been taken from STOTHARD'S picture of one of those subjects—partly real, partly imaginative—in which he was most successful as a painter. We need not occupy much space in describing the custom that is represented. The Dunmow prize is said to have been instituted by ROBERT FITZWALTER in 1244. The flitch of bacon was available for "whatever married couple will go to the priory, and, kneeling on two sharp-pointed stones, will swear that they have not quarrelled nor repented of their marriage within a year and a day after its celebration." Simple as the conditions may appear at first sight, they impose a test which few people are sufficiently happy to sustain. The flitch was not claimed, it is said, until 1445, when one RICHARD WRIGHT, a Norfolk man, was successful. Up to 1855 there are records of no more than six flitches having been distributed, or about one in a century. The scarcity of competitors is enough to make bachelors and foreigners rather sceptical about the happiness of married life in England, as in other places. If poets and painters were, however, restricted by realism, there would be an end to their art. STOTHARD, who knew little of family jars, painted a scene which might have occurred, and there was no necessity for him to inquire how often an order had been given to an Essex farmer to supply a flitch of bacon, or to speculate about the feelings of the young couple when they had arrived at forty years. The picture was a consequence of the marvellous success of the *Canterbury Pilgrims* as a subject for an engraving when exhibited. The following description of the work was written by Mrs. BRAY, the daughter-in-law of STOTHARD:—

I do not know at what period Stothard painted *The Flitch of Bacon*, which, from form and size and subject, becomes a companion to the *Pilgrims*. It was, however, a later work. The nature of the subject gives an air of festive triumph to every gay figure in the group. Before the young and amiable pair who have won the flitch is seen a serving-man bearing it along. By the side of his horse walk the country minstrels, who head the procession with harmony. Two lovely and sylph-like damsels run before the animal that bears the wedded couple, strewing flowers. After them follow the train of friends and attendants crowned with garlands, some mounted, others on foot. The picture is closed by a group of figures who stand as spectators. Amongst these the painter has introduced himself—the head is in profile, the likeness faithful. A beautiful young gentlewoman, who stands in the midst with a fan of feathers in her hand, is listening to some remark made to her by one of her own sex, whilst her head modestly inclines downward to avoid the admiring looks of two young cavaliers, each mounted, who close the procession, and who seem to be equally struck by her beauty. One of them is touching his hat to her with a fixed gaze of admiration, the other bows bareheaded, but appears to look upon her with more diffidence in his face. The painter by these figures, which form a little episode in the story of the flitch, seems to indicate that between the two young men a future rivalry is likely to spring up for so fair a prize. The landscape and every accompaniment of the painting is light, glowing, and exhilarating. From this circumstance I confess it is my favourite. I prefer it to the *Pilgrimage*. The dresses of the figures in this charming subject represent the picturesque costume of the time of Charles I.

## THE INSTITUTE REPORT.

THE annual report of the Council begins with an expression of regret at the retirement of the senior vice-president, Mr. David Brandon. Mr. Fraser, of Leeds, Mr. Honeyman, of Glasgow, and Mr. Paley, of Lancaster, have intimated their intention to make way for other non-metropolitan representatives. Mr. Blomfield has also resigned.

The number of members in 1884 was 1,276, which is four above the year before, and six above the year 1882.

During the year the Institute lost the following members by death, viz.:—W. P. Griffith, M. E. Hadfield (Sheffield), John Middleton (Cheltenham), Edwin Nash, R. M. Phipson (Norwich), J. H. Sanders (Derby), William Thompson, and John Whichcord, past President, among the Fellows; A. Bevan, H. Blackwell, F. Johnson (Bodmin), C. Marriner, W. Paice, and H. E. Tijou (Manchester), among the Associates; C. Henman (formerly a Fellow), H. A. Palmer, and Sir Erasmus Wilson, among the Honorary Associates. One foreign member, Professor Lepsius, of Berlin, who received the royal gold medal in 1869, is also deceased, and at a very advanced age.

A comparison of the income derived from subscriptions (exclusive of arrears) shows 3,145*l.* 16*s.* in 1884, as against 3,069*l.* 1*s.* in the previous year, and 3,059*l.* 12*s.* in 1882.

Examinations have been held in Manchester and London. Of the twenty-four gentlemen who presented themselves seventeen have received notice that they are qualified to become candidates for the Associateship; four have been relegated to their studies for one year, and two for two years, with permission to present themselves again for examination after the prescribed period without further payment and without submitting probationary work. The Council have also to report that, in the opinion of the Board of Examiners, the merits of the candidates generally were not such as to warrant the presentation of the Ashpitel prize, which has not been awarded for two years. The Council trust that the work of future candidates will be of a character sufficiently good to prevent a recurrence of these results.

The recommendation of the Institute that the Royal gold medal for the current year be awarded to Dr. Schliemann, has received the approval of the Queen. The Library Committee report:—

During the twelve months elapsed from April 1, 1884, to March 31 of the present year, the number of volumes presented to the library was 104 and to the loan collection twenty-six, exclusive of periodicals, reports and transactions of societies, and parts of works issued in a serial form. The works purchased comprise twenty volumes and four pamphlets for the library and ten volumes for the loan collection, together with several Parliamentary papers. The day attendances show an increase of 224, or more than 27 per cent., and the evening attendances an increase of 404, or 40 per cent., over those of the preceding twelve months. The number of fresh tickets (exclusive of renewals) issued for admission to the use of the library and loan collection was 70. The number of volumes issued on loan was 940, being an increase of more than 12 per cent. upon the number issued during the preceding twelve months. The extent to which members of the Architectural Association have availed themselves of the privileges of the library has recently been looked into, with the following results. The number of attendances for reading in the library was, from March 1 to December 31, 1880, 177; during 1881, 184; 1882, 371; 1883, 550; and 1884, 964. The number of loan collection issues was, from March 1 to December 31, 1881, 93; during 1882, 264; 1883, 417; and 1884, 465. Among donations to the library, special mention is made of the coloured copy of the great work, collated, under the auspices of Napoleon, by the Institut de France, as a memorial of the expedition to Egypt at the end of last century. For this the Institute is indebted to Mr. James Ferguson.

After recording the prizes which have been awarded, the Council express regret that only one essay was submitted, and that it was not of sufficient merit to warrant their recommending it for the prize. The same subject, "Pediments and Gables," has been set for next year, and the sum of twenty-five instead of ten guineas is offered as a premium to accompany the Institute medal for essays, in 1885-86. They have further to report that neither in this nor in the preceding year have any designs been received in competition for the Grissell gold medal for construction, and they are compelled to believe that the principal reason for this marked abstention is the unwillingness or inability of architect-students to touch the important subject of iron construction—a subject which was set in 1883, repeated in 1884, and is again set for the current year, with the addition of a premium of ten guineas to be given with the medal.

The list of medals, studentships, and other prizes for the current year is one of increased and unusual importance, and includes the new Owen Jones studentship, to be held under conditions for two years, for the study of architecture, more

especially in regard to ornament and coloured decoration, and a special studentship to be held in 1886 for the encouragement of the study of Classic architecture and of classical Renaissance architecture in the kingdom of Italy.

The Competitions Committee have made considerable progress in their work. During the year a circular-letter, setting forth the objects and aims of the architects who have signed the undertaking, has been sent to all the mayors and other public functionaries throughout the United Kingdom, and to the editors of the leading metropolitan journals. At the present time the number of adhesions from architects exceeds 1,400. From March 1884 to the present date the committee have been in correspondence with the promoters of forty-six competitions, and have been mainly instrumental in procuring the appointment of assessors in fourteen cases. The greatest drawback to success lies in the fact that a large number of architects will still compete, no matter what the conditions are, so that promoters can easily procure architects to send in designs, without the condition of an assessor being appointed.

In respect to the charter, the Council have carefully considered a memorial presented in November by more than 450 Associates, as well as representations received from non-metropolitan members; and, having availed themselves of the services of a solicitor who has had large experience in advising on such matters, they are now in a position to consult with the Associates' Memorial Committee, and with delegates from non-metropolitan societies. The Council therefore hope to be able shortly to lay the result of their inquiries before a special general meeting of the Institute, for the consideration of the general body of members.

The Professional Practice Committee have held four meetings, at which subjects of much importance have been considered and dealt with. An application to be admitted into the class of Fellows which was received from an officer of the Royal Engineers has been carefully considered by the Council, but it was found that no power existed under the charter to admit as professional members such military officers, who, so long as they remain in the service, and whatever their particular employment may be, are eligible only for admission to the class of Honorary Associates.

The resignation of some non-metropolitan members having occurred at the close of 1884, on the sole plea that they are resident at too great a distance from London to attend the Institute meetings, the Council venture to urge that the corporate body of British Architects exists for a higher purpose than that of a general meeting or for the maintenance even of a library. It exists for the advancement of architecture as a profession, as well as an art and a science; and in this country, where the State remains neutral, academies, institutes, and such learned societies depend entirely upon the support and co-operation of individuals—a matter, the Council think, of as much importance to architects throughout the country as to those of London.

## THE LATE MR. ROBERT ANDERSON, A.R.S.A.

WE deeply regret, says the *Scotsman*, to announce the death of Mr. Robert Anderson, A.R.S.A., who has for many years occupied an eminent position as an engraver, etcher, and water-colourist, and who also of late has been an exhibitor in oil in the Royal Scottish Academy. He died on Friday morning in last-week at his residence, 16 East Claremont Street, Edinburgh, at the early age of forty-three. He had been in failing health for some time past, and during the last three years the chest complaint—contracted, it is understood, through exposure out of doors in the early portion of his career as a painter—from which he suffered rendered it necessary for him to spend the winter months abroad. By profession an engraver, Mr. Anderson early displayed his acquirements and ability in that department of art, and for several years nearly all the principal Royal Association figure pictures were engraved by him. His last large engraving was that of Mr. Herdman's picture of Prince Charlie taking refuge in the house of one of his devoted adherents. Adding water-colour painting to his studies, the deceased gentleman during the last dozen years produced many works in this branch of art which found a place on the walls of the Royal Scottish Academy. His well-known water-colour of the last great review in Edinburgh was etched by R. W. Macbeth, A.R.A.; and his etchings of his own drawings were always readily picked up. His first oil painting to the Royal Scottish Academy appeared last year in the exhibition—a sea piece which challenged general attention. It was followed this year by a larger and more important picture, which justified his adoption of oil painting, and which is really a powerful sea piece, representing the aspect of Wick harbour in an easterly gale. He had contributed to the Academy every year since 1873, when he began to exhibit in water-colours. Ten years later (in 1883) his works included *Gipsy Peasants*; *The Evening Tide*; *Entrance Gate to San Paolo*, *Seville*; and *The Missing Boats*. Mr. Anderson was a

native of Edinburgh. Of a genial and kindly bearing and disposition, he was greatly esteemed by all who had the pleasure of his acquaintance; and every one regarded his election as an associate of the Royal Scottish Academy a just and well-merited recognition of his worth, acquirements, and ability. Mr. Anderson is survived by a widow and a family of five.

## THE ROYAL HIBERNIAN ACADEMY.

ON Saturday there was a meeting in Dublin. The prizes obtained by the students of the Royal Hibernian Academy were handed to them by the President. The following were the successful students:—

Drawing from the living model (silver medals)—R. T. Moynan and C. E. Lodge. Bronze medal—J. O'Reilly.

Drawing from the antique—R. T. Moynan.

For the best drawing from life—1st, C. E. Lodge; 2nd, J. O'Reilly.

For the best drawing from the antique—1st, C. E. Lodge; 2nd, J. O'Reilly.

Special prize, offered by Mr. John O'Connor, A.R.H.A., for the best set of drawings from life—H. Tisdall.

Sir Thomas Jones then delivered an address, of which the first part was a repetition of what was spoken in Liverpool in December. In conclusion, the President said:—I have now given you the substance of my address to the Liverpool students, and, in conclusion, permit me to add a few words to the medallists and other students of this academy. It has now become usual for those who win the highest honours we can give to complete their studies in the Royal Academy of Antwerp, or in some Paris *atelier*, and I strongly recommend this practice to all who can afford to continue their course of study under more favourable auspices than can be obtained here. I allude more particularly to the facilities afforded the student to acquire the "mécanique" of painting. Drawing can be learned here as well as on the Continent. We have the same casts from the antique, and as good, if not better, living models; but, unfortunately, none of our resident artists can afford to give their time gratuitously to the painting classes, and the funds of this academy will not permit us to adequately remunerate our visitors. With the limited means at our disposal we are making an effort to establish an efficient painting class, and, I am happy to say, we are ably seconded by the exertions of Mr. S. Catterson Smith, who gives the students as much time as he can afford from the imperative claims of his profession. But another great advantage to be derived from study in foreign schools is the severe training which is imposed on the students, and the discipline to which they must submit or leave the school. I am happy to say that the majority of those who have left us for the purpose of foreign study cheerfully adapt themselves to what to them must appear restraint, the result being very apparent in the works they send up from time to time; and you are all aware of what honour to themselves and credit to our academy has been gained by Messrs. Osborne, Moynan, Tisdall, Kavanagh, and Hill, one of the number, Mr. Moynan, having carried off the first place against competitors of all nationalities in the "concours" at the Antwerp Academy. I trust he will not rest satisfied with his laurels, but that he and others who have gained distinction will continue their studies with the earnestness which has marked their commencement. You are all ambitious to become successful artists, but you must count well the cost, and bear in mind that your chances of success, as long as you remain here, are poor indeed; for as a people we have little taste for art, and little encouragement for its professors. If you can be content with local reputation, and satisfied with the paltry reward you can at best secure, you may give up further study, indulge in relaxed discipline, and paint for an apathetic public. But if you have higher aspirations, if you wish your name to "echo through the corridor of Fame," and your talent to be recognised wherever the English language is spoken or understood, bend all your energies to arm yourself for the great artistic arena—the capital of the British empire—and win your spurs in the lists of the Royal Academy, or in some of those London galleries where to have a work upon the walls is a diploma in itself. I know I am laying myself open to the accusation that in this recommendation I give most unpatriotic advice, but it is sound, nevertheless; and you will see that it is so when you recall the names of those Irish artists which are inscribed upon the "libro d'oro" of artistic reputation. Do you imagine that Barry, Mulready, Danby, Sir Martin Shee, Maclise, Elmore, Foley, Macdowell, Hayes, and the Irish director of the London National Gallery would have made their names as familiar as household words by remaining here? No. Artists of possibly as great ability as those who transferred their talents to London have from one cause or other, often from social ties, elected to remain here, and their names are now forgotten. The city that knew them knows them no more, and the picture-dealer looks at you with the expression of one who listens to a language he does not

understand if perchance you allude to them or their works. And the worst of it is that every year Irish art, even in London, fails more and more to make its mark from that lack of energy and want of perseverance which too often characterises our countrymen, and the possession of which has mainly contributed to the marvellous success of the Scotch artists. When you bear in mind that among the foundation members of the Royal Academy, Ireland was represented by an ancestor of our Academician, Mr. Hone, and since then, of the Irish artists I mentioned just now, who were members of the Academy, one became President and another, Maclise, might have worn the red gown had he cared for the honour—when we remember this and contrast it with the present it makes one's cheek burn with shame, to think that not only is the Royal Academy at the present time without an Irish member, but among the artists who are likely to be candidates there is not one Irishman. I trust some young artist who heard me this evening will register a vow to regain that position once held by his countrymen; and I trust that some here present may live to see an Irish picture once more upon the line in the Royal Academy, and an Irish name again appear in the ranks of the members and Associates of that exclusive body. After a well-fought fight against systematic discouragement, the Scotch artists have fairly won this recognition, and it is not improbable that ere long the majority of the members of the Royal Academy will hail from beyond the Tweed. Then why should Irishmen of the present day drop out of the contest disheartened? The field of fame is open, but remember the knight must be armed at all points for the encounter. That some young champion may come forth to bear aloft the banner of his nationality is the ardent and long-cherished desire of one who, though himself retired from the combat, still watches the struggle with a patient eye.

"Antiquity after a time has the grace of novelty."—HAZLITT.

### M. GUIZOT ON THE ROYAL ACADEMY.

THE annual banquets of the Royal Academy have given opportunity to many of the famous men of the century to express their opinion on art. It may not be known by all our readers that among the orators was M. Guizot. In 1839, when Marshal Soult was made President of the Council, M. Guizot accepted the appointment of ambassador to England. His mission was, however, of short duration, for in the whirligig of politics Thiers again became Prime Minister, and Guizot declined to serve under his rival. The following is a translation of the speech which Guizot delivered at the Academy banquet on May 2, 1840. Sir Martin Shee was president at the time:—

Mr. President, Gentlemen,—The diplomatic body is deeply touched by your noble and kind hospitality, and I am happy to have at this moment the honour of being the organ of its sentiments of gratitude and sympathy. Nowhere, in truth, are they more natural, or better placed, than on this spot and at this solemnity. Many ages ago, when the Emperor Vespasian conceived the design of assembling in one place all the *chefs-d'œuvre* of the arts which conquest had brought together in Rome, he chose the Temple of Peace. He wished that all the peoples, forgetting their ancient enmities, might enjoy together this fine spectacle. Nothing agrees better than peace and the arts. There is between them a natural and powerful harmony. Whoever may doubt it has only to cast his eyes on what has passed in Europe during the last twenty-five years. It cannot be said that these years have been for the arts an epoch of grand and original creation, nor that they have produced many of those new *chefs-d'œuvre* which render an age illustrious among ages. Yet the intelligence and taste for the arts have been spreading, have penetrated into places, among men who hitherto had been strangers to them. In traversing Germany, France, and also, without doubt, England, we see rising everywhere, in the provinces as well as in the capitals, a crowd of monuments, great or small, ambitious or modest. The statues of the great men come to people the public resorts. If any exhibition analogous to the present is anywhere opened, the crowd runs to it. Painting, sculpture, music, all the arts, enter into peoples' tastes, into their manners, and become almost popular. This is a great blessing, gentlemen, at our epoch, and in the state of modern society. What would you do, what should we do, in all our countries, with all these men—these millions of men—who are incessantly rising to civilisation, to influence, to liberty, if they were exclusively given up to the thirst of material prosperity and to political passions? if they dreamed but of en-

riching themselves, or of contending about their privileges with their fellows? They need other interests, other sentiments, other pleasures. Not to turn them from the amelioration of their condition and from the progress of their liberties; not that they should be less exigent (*exigeans*) and less proud in social life; but, on the contrary, to render them capable and worthy of their more elevated condition—capable and worthy to carry higher in their turn that civilisation towards which they mount in crowds. And, also, to satisfy in them those *penchants*, those instincts of our nature, which are satisfied neither by material prosperity, nor even by the works and spectacles of political liberty. Like literature and the sciences, the arts possess this virtue: they open to the activity and enjoyment of men a fair and wide field; they spread pleasures which are brilliant and pacific; they at the same time animate and calm men's minds; they soften our manners without enervating them; they bring together and unite, in one common enjoyment, men who are otherwise very different in situation, in habits, in opinions, in desires. It is not, therefore, for yourselves alone, gentlemen, for your own pleasure only, that you cultivate and encourage the arts. The Royal Academy, its institution, its exhibitions, have a greater aim, a merit truly social. We congratulate ourselves on being associated to-day in its solemnities. We sympathise in its labours and its hopes. In such a meeting, in presence of these *chefs-d'œuvre*, under the influence of the sentiments which they inspire in us, we are your guests, gentlemen; but there are no strangers here.

### COMMEMORATION OF SIR JOSHUA REYNOLDS.

The Academy dinner recalls another feast, one that was held in May 1813. It was given by the directors of the British Institution in honour of Sir Joshua Reynolds. The following is a contemporary account which was considered worthy of preservation by Sir Martin Shee, P.R.A.:—

The fête of Saturday last was a proud day for the arts of England, for it presented an assemblage of pictures, all by the hand of one English master such as no country upon earth could rival; and the rooms of the British Institution, though adorned by about one hundred and thirty of Sir Joshua Reynolds's performances, do not contain more than a specimen of his labours, as perhaps not fewer than three thousand pictures in all have issued from his easel. A gentleman in the rooms told us he actually possessed near seven hundred different engravings from his works, and it is obvious that few of his many family pictures were ever engraved. The managers of the British Institution, in resolving upon this affectionate tribute to the memory of Sir Joshua, have taken the most efficacious course for the ultimate promotion of their first object, that of forwarding the progress of the English school by spreading over the public mind a correct taste for the fine arts, and by warming youthful genius into enthusiasm by the honours thus paid to departed excellence. Prizes and premiums may do much with some tempers, but they have too much affinity with commercial feeling to stimulate the ardour of genuine ambition. We are sure that the student who shall behold this unrivalled collection, and listen to the public sentiment which it excites, will not merely be proud of belonging to the Academy of which he was the president, but will feel the glowing spirit of emulation stir him to the pursuit of rival glory. It is indeed a most animating spectacle, and must be as favourable in its consequences as it is gratifying in itself. The variety of the subjects—the poetical character which breathes in every production, and which advances each individual portrait to the rank of a history, the grandeur chastened by the simplicity of the compositions, the felicity of adaptation both of colouring and of accessories to the chief object—everything contributed to impress on the company who partook of this festival the most delicious and unmixed delight, both as patriots zealous for the honour of the country and as amateurs fervent in the promotion of the art.

The managers determined to open the exhibition by a meeting to commemorate the artist. For this purpose it was resolved to make a temporary communication from the house of the institution to Willis's great hall, in King Street, for the dinner, and to keep the exhibition rooms unencumbered to serve as drawing-rooms for the company. His Royal Highness the Prince Regent honoured the meeting with his presence; he continued an hour in the exhibition before dinner, and entered the room about half-past six. He was placed in a chair of state, and the Marquis of Stafford, at his right hand, discharged the duties of chairman for the day.

There were also present:—

Marquis Camden, Earls of Liverpool, Harrowby, Bathurst, Mulgrave, Aberdeen (president of the Antiquarian Society), Ashburnham, Grosvenor, Grey, Cowper, Hardwicke, Egremont, Harcourt, Upper Ossory; Lords Castlereagh, Amherst, Brownlow, Borringdon, Dundas, De Dunstanville, Falmouth, Harewood, Crewe; the Right Hon. the Speaker, C. B. Bathurst,

Charles Long, Sir W. Scott; Sirs G. Beaumont, T. Bernard, Abraham Hume; Generals Phipps, Hammond, Turner; Messrs. Angerstein, Davis, Duncombe, Hope, Knight, W. Smith, Sheridan, Whitbread, the President and Royal Academicians; in all, about one hundred and forty persons.

The dinner was conducted rather in the manner of that of a private table than of a tavern. There were no professional singers, and the toasts were not accompanied with the usual demonstrations of applause. The noble President introduced the toast to the memory of the great master, whose works and whose virtues they were this day assembled to commemorate, with a graceful tribute to his high merits. His Royal Highness and all the company stood up, and received the toast with that sentiment of reverence and affection for the memory of Sir Joshua Reynolds which every lover of the fine arts must feel.

Mr. West, on his health being drank, coupled with that of the Royal Academy, over which he so worthily presides, returned thanks in a short speech, in which he expressed his gratitude for the signal mark of favour shown on this day to the memory of the eminent person whose powerful genius had, under the fostering auspices of the illustrious family on the throne, raised the English school to its present celebrity. Every member of the Academy felt the high honour done to this body in the tribute paid to their former president.

The Earl of Aberdeen also, as president of the Antiquarian Society, made a short and elegant address of thanks when that society was given as a toast. He said that it ought ever to be remembered that, in the first revolution of the fine arts from the barbarism of the Middle Age, the revival of a correct taste was founded on a reference to, and study of, the admirable fragments of the sculpture of ancient Greece and Rome which have been happily preserved to us, and which the great master whose memory they were that day assembled to commemorate had constantly made his models, from the quick judgment with which he perceived that the purity and excellence of his art depended on simplicity, nature, and truth.

His Royal Highness rose at half-past nine, and was conducted back to the exhibition rooms by the noble chairman. The company stopped to drink the health of the Prince Regent again with the honours, and followed him to the rooms, which were finely illuminated, and a splendid appearance of ladies heightened the *coup d'œil* of the spectacle. Many more persons of the highest distinction, among whom were several of our prelates, had also come to the gallery in the evening, and the promenade continued till a late hour at night, when the company departed with the highest sense of the propriety and taste with which the entertainment had been conducted.

### ROMAN EXCAVATIONS.

ARCHÆOLOGICAL discoveries of importance are rapidly succeeding each other in Rome. That within the limits of the Temple of Vesta illustrating the rites performed there has been followed by another, made within the distance of a few yards, connected with the Christian Church and the ecclesiastical history of the tenth century (*circa*). It will be remembered, says the *Times* correspondent, that immediately behind the remains of the Temple of Castor and Pollux, and adjoining the Church of Santa Maria Liberatrice, there stand the colossal walls of an edifice of brickwork of the finest Imperial construction. What it was no one ventured to pronounce. The late Mr. J. H. Parker maintained that one of the walls belonging to it was part of the celebrated bridge built by Commodus across the Forum, from his *domus* on the Palatine to the Temple of Jupiter Capitolinus. Others have thought that these walls might be the remains of the temple dedicated to Augustus, which was somewhere in this vicinity. But these theories must be dismissed, together with others propounded in times past. Within and against the walls of this mysterious relic of Imperial magnificence a number of hay-lofts had been built, hiding them almost entirely, except where they towered above the modern roofs. These hay-lofts, the ground floors of which were occupied by wheelwrights and carpenters, are now in process of being demolished. Already the area of one great hall, with large niches for statues in it, and far exceeding in dimensions and grandeur any of the remains of the Forum adjoining it or of the Palace of the Cæsars above it, has been cleared. It was soon seen that the flooring almost corresponding with the modern level was of recent date. It was cut through. The original flooring was found at a depth corresponding with the level of the Forum itself. One-half of this hall has been further cleared down to that level, and from it opens a passage the walls and ceiling of which are covered with comparatively uninjured fresco paintings representing Christian saints standing in rows on one side and the other, while on the face of the wall of the hall itself are remains of similar frescoes, indicating that it had been completely decorated in the same manner.

The Commendatore de Rossi attributes these frescoes to the tenth or eleventh century, but for the present reserves any further opinion beyond that which he put forth in a tentative manner, with references in part proof of it, in a paper written by him on the eight hundred Anglo-Saxon coins discovered in a jar two years ago close to the House of the Vestals. This opinion was to the effect that at the time those coins were sent to Rome the Imperial buildings along that side of the Palatine were occupied by the pontiffs as their residence, and by the officers of the ecclesiastical Government, as the Vatican is now. We must wait for the completion of Signor de Rossi's studies and researches regarding this interesting subject. But in the meantime one may be tempted to suppose that we see in this wall of an unknown edifice of one of the first Cæsars the hall, perchance, of the Consistory of the time of Alfred the Great, whose money was found near it. The completion of the excavations will, it is hoped, throw full light on the original nature of this grand edifice of pagan Rome and the later use to which it was applied in Christian days.

### BIRMINGHAM ARCHITECTURAL ASSOCIATION.

A PAPER was read at last week's meeting by Mr. A. Reading on "A Comparison between English and Continental Renaissance Architecture." The lecturer, with the aid of a powerful lantern, illustrated his remarks by views of some of the most important Renaissance buildings abroad and at home, and pointed out the successive waves of Renaissance expression, which differed very materially, according to the country in which it was practised. The lecturer urged all admirers of this style to study the Early Italian Renaissance, as it was only to be found in that country in its simplicity and purity; and further strongly advocated, where the style was adopted in this country, the advisability of following in the steps of the Italians and drawing from the pure Classic of ancient Greece and Rome, adapting their forms to modern requirements, and thus in time forming a pure Renaissance of our own. A hearty vote of thanks, proposed by Mr. H. H. McConnal, and supported by Mr. Victor Scruton (honorary secretary) and the vice-president, was unanimously accorded to Mr. Reading for his interesting paper.

### TREATMENT OF ARCHITECTS IN AMERICA.

THE following paragraphs from the *American Architect* show the difficulties with which the architects of the United States have to deal when they have public bodies for patrons:—

Most of our readers know something of the unfortunate result of the competition for the Boston Public Library, in which, after offering very liberal prizes, the city failed to obtain a plan suitable for its purposes—not through any fault of the architects, but simply, to put in a few words the general conviction on the subject, because the terms of competition were drawn up without suitable advice. Since the award, therefore, which condemned the taxpayers of the city to pay ten thousand dollars for a few sheets of drawings embodying designs which their authors were compelled by their instructions to make impracticable and injudicious, there has been a good deal of curiosity, among the public quite as much as in the profession, to see what new steps would be taken for procuring proper plans for the building, which must be begun within a few months, under penalty of the forfeiture of the land granted by the State to the city as a site for it. The first of these steps, according to the Boston papers, has just been taken, in the shape of an order, passed by the municipal government, instructing the city architect—a young man who devotes his time to the city building work—to prepare plans for the library building, and submit them to the trustees of the library for approval. With all respect to the city architect, we cannot help thinking that the people of Boston would much prefer to have their costly library erected under the direction of some individual of greater distinction in the profession; and, although the terms of the ordinance do not prevent the library trustees from employing expert advice in considering whatever plans may be presented to them, it would, we are sure, be more satisfactory to them, as well as to the taxpayers, to have it distinctly understood that no plan would be approved or adopted without professional criticism. We take it that the citizens desire to have the best, most convenient, and beautiful building that their money will procure, and are not only willing, but anxious, to secure this by the only possible mode—that of employing the best architect who can be had to design it; and we imagine, moreover, that they think they have thrown away enough money in trying to dodge this conclusion, and would

be glad to see an end of amateur tinkering with the most important building project that the city has undertaken for many years.

The pressure for the removal of the present architect of the Capitol, Mr. Edward Clark, and the substitution of some politician, still continues, although no reason whatever has yet been given for displacing a man admirably qualified for his duties, who has been professionally connected with the Capitol for 34 years, and knows nearly every stone in it, to make a place for some dilapidated party hack. For persons unfamiliar with Washington a little reflection is necessary to understand the importance of such an office as that which Mr. Clark now fills. Perhaps no public building in the world is harder "worked," to use an expressive phrase; and alterations, refittings, and repairs are continually going on. To carry these out satisfactorily and economically, or to devise modes of satisfying new wants, such as every year develops, a thorough acquaintance with the fabric is absolutely necessary, and the tinkering of a novice might easily result in irremediable mischief. Unlike many of our public buildings, the Washington Capitol, partly through the skill of Mr. Clark himself, who acted as assistant to the architects of the wings which form the most important portion, is a work of art which may safely challenge comparison with any architectural object in the world, and it would be a misfortune to the whole country to have that discretion which has saved the pure and noble beauty of our principal building from so many dangers exchanged for the guardianship of a man who, however devoted and skilful he might be, must inevitably lack the special tastes and training which have so admirably fitted Mr. Clark for his position.

### ELECTION OF A DISTRICT SURVEYOR.

AT the meeting of the Metropolitan Board of Works on April 24 there was an election of a surveyor for the district of East Kensington. The number of candidates was first reduced to six by a show of hands; the names were then put to the vote *seriatim*, and the name of the candidate having the least number of votes was struck off at such voting. According to the *Metropolitan*, the following were the candidates for the appointment, the number following each name denoting the votes recorded for each at the first voting:—Mr. A. Ashbridge, 26; Mr. T. Batterbury, 15; Mr. H. H. Bridgman, 12; Mr. C. W. Brooks, 11; Mr. H. Cheston, 17; Mr. F. S. Clarkson, 22; Mr. J. S. Edmeston, 19; Mr. G. Edwards, 7; Mr. J. M. Ferguson, 2; Mr. R. F. C. Francis, 16; Mr. W. Grellier, 6; Mr. Hamilton, 2; Mr. W. J. Hardcastle, 26; Mr. A. Harland, 3; Mr. E. Haslehurst, 8; Mr. G. Inskip, 4; Mr. G. Jackson, 3; Mr. G. A. Lean, 14; Mr. H. Lovegrove, 8; \*Mr. H. McLachlan, 20; Mr. E. Marsland, 32; Mr. T. E. Mundy, 19; Mr. R. C. Murray, 10; Mr. W. H. Nash, 9; Mr. O. Renton, 5; Mr. W. Smallpiece, 12; Mr. L. Solomon, 9; Mr. W. L. Spiers, 9; Mr. W. H. Stevens, 16; \*Mr. H. W. Stock, 20; Mr. E. Street, 32. \*This tie was decided in favour of Mr. McLachlan. The following shows the final voting:—Mr. Ashbridge, 21, 13; Mr. Clarkson, 16, 15, 16; Mr. Hardcastle, 24, 22, 16, 10; Mr. McLachlan, 14; Mr. Marsland, 33, 34, 34, 35, 34; Mr. Street, 24, 21, 29, 22, 10. Mr. Marsland was, therefore, declared elected.

### ART UNION OF LONDON.

A GENERAL MEETING of the members of this association was held on Tuesday, under the presidency of Mr. James Hopgood, on the stage of the Adelphi Theatre. The annual report, read by Mr. J. A. Hallett, showed that the subscriptions of the year amounted to 8,786*l.*, and this sum, considering the continued universal depression, the council thought larger than could have been reasonably expected. The sum allotted for prizes was 2,265*l.*; 564*l.* was set apart towards providing works of art for accumulated payments and for print of the year, almanack, exhibition, report, and reserve, 2,838*l.*, making 5,667*l.*, the balance, 3,811*l.*, representing agents' commission and charges, advertisements, &c. The council had lately had an opportunity of acquiring the copyright of a very faithful portrait bust of the late General Gordon by Mr. R. B. Stocks, a gold medallist of the Royal Academy, and they had to express their acknowledgments to Sir Henry and Lady Gordon for giving much time and trouble to the superintendence of the work with a view to obtain a satisfactory likeness. Copies in terra-cotta were included in the day's distribution and would afterwards be procurable by members in lieu of the print, by adding 20*s.* to the amount of subscription. For the first prize, an original painting, *Vanguard*, representing an incident in the defeat of the Armada, a sum of 210*l.* had been allotted. Other prizes, including 50 terra-cotta busts of General Gordon, 80 sets of designs from English history, 50 portfolios of 24 plates of animal life, numbered 545 in all. A

review of the losses to art sustained through death during the year followed. In moving the adoption of the report the chairman said he regretted that the subject of the prize picture happened to be so applicable to the circumstances of the country at present. He should have preferred it to have been some pastoral scene, but since this picture was the prize on the present occasion, he hoped that, recording as it did the deeds of a gallant admiral and our brave sailors, it would be an omen of success should we unhappily be drawn into a war. The first prize, the painting of the *Vanguard*, valued at 210*l.*, was drawn for Mr. John Fore, of Monte Video (No. 6,300), and the 100*l.* prize fell to No. 6,530, Mr. H. Chilmard, of Brighton.

### ARCHITECTURE AND ENGINEERING.

AT the last fortnightly meeting of the Liverpool Engineering Society, the president (Mr. W. E. Mills) in the chair, a paper by Mr. W. Goldstraw, entitled "The Relation between Engineering and Architecture," was read by the author. It was said that the relations between engineering and architecture are, on a reduced scale, the relations between science and art. Engineering may be said to be that entire system of knowledge and skill which comprises all mechanical pursuits, so far as they supply the material wants of men. Architecture, or the art of ornamental and ornamented construction, as applied to buildings, is the development and refinement of an important branch of engineering. They were both formerly practised by the same persons, but have become separate pursuits on the modern principle of the division of labour; and the requirements of science have made it difficult to follow both professions at once with success. It is desirable that the engineer should be more of an architect, and the architect more of an engineer. At the same time, the two pursuits should be kept even more distinctively separate than at present. But whilst the engineer or the architect practises his special calling only, he should have a considerable knowledge of the other profession. Indeed, as both avocations are concerned with building, it would probably be a successful arrangement sometimes for an engineer and an architect to join in partnership. By this means, if the work done were of good quality, they might get many commissions which either of them by himself would fail to secure, or would imperfectly carry out. In such cases the competing professions and the public would be mutually benefited.

### EXPLORATION IN ASIA MINOR.

A COLLECTION of views taken during expeditions to Asia Minor by Mr. Richard Popplewell Pullan, F.R.I.B.A., is now to be seen at the Burlington House Arts Club. Mr. Pullan gives the following account of the explorations:—

These views are selected from a series of eighty illustrations of expeditions to Asia Minor, undertaken for the purpose of obtaining sculpture, inscriptions, and data for the restoration of Greek temples and other edifices.

There were four of these expeditions. The first was that in charge of Mr. Newton, C.B., Keeper of Greek and Roman Antiquities at the British Museum, for the discovery of the Mausoleum in 1857–58; the second, that for the excavation of the Temple of Bacchus at Teos in 1862; that for the excavation of the Temple of Apollo Smintheus in the Troad in 1866; and that for the excavation of the Temple of Minerva Polias at Priene in 1869. These three were in the charge of Mr. R. P. Pullan.

The Mausoleum was the tomb of Mausolus, King of Caria, and one of the seven wonders of the ancient world. Pliny thought it worthy of a minute description. He even records the names of the artists employed in its construction. He says:—"In the same period Scopas had as rivals Bryaxis, Timotheus, and Leochares, whom I would mention together, as they were associated in the work of decorating the Mausoleum with sculpture. Artemisia made this sepulchre for her husband, Mausolus, Prince of Caria, who died in the second year of the Hundred and Seventh Olympiad. It was chiefly due to the artists whom I have already named that this work was reckoned among the seven wonders. On the south and north it extends 63 feet, being shorter on the fronts; its entire circuit is 411 feet; it is raised in height 25 cubits (37½ feet); round it are thirty-six columns. The part surrounding the tomb was called the Pteron. The sculptures on the east side were by Scopas, on the north by Bryaxis, on the south by Timotheus, on the west by Leochares.

"Before these artists had terminated their labours, Queen Artemisia died; but they did not cease from their work till it was completely finished, regarding it as a monument of their own fame and of art. With these sculptors a fifth artist was associated. Far above the Pteron a pyramid equalled the lower height, contracting, by twenty-four steps, to a point like that of a *meta*. On the summit is a marble chariot with four

horses, the work of Pythios. The addition of this made the height of the entire work 140 feet."

The discovery of the site of this famous edifice was for many years the desideratum of antiquaries. It was at Halicarnassus, now Boudroom, and thither various travellers went in search of it—Captain Spratt, Dr. Ross, and Professor Donaldson amongst the number. The latter observed certain capitals, which he rightly concluded to have belonged to the edifice, but Mr. Newton was the fortunate discoverer of the real site in 1857. Her Majesty's Government despatched the *Gorgon* frigate, and the late Murdock Smith, R.E., with a detachment of Royal Engineers, to aid in the excavations, and subsequently sent Mr. Pullan to assist Mr. Newton. After a year's labour the site was thoroughly explored, all the necessary information obtained, and the remains of sculpture sent to the British Museum. When his work at Boudroom was nearly completed, Mr. Newton removed the expedition to the city of Cnidus. Here he remained another year, and made several important discoveries.

Upon Mr. Pullan's return to England, the Society of Dilettanti—who were the first to encourage research for the purpose of illustrating Greek art—commissioned him to visit the sites of three celebrated temples, and to report upon the facilities for excavation. Mr. Pullan returned to the East in 1861, and took the opportunity thus afforded of exploring the whole west coast of Asia Minor, from the point visited by the Boudroom expedition to the Troad, a distance of between 200 and 300 miles. He visited Ephesus, Sardis, Pergamus, Miletus, Assos, Iassus, and other ancient sites, in the course of his journey. In the spring of 1862 he received instructions to excavate the Temple of Bacchus at Teos; in 1866 the Temple of Apollo Smintheus, in the Troad; and in 1868 the Temple of Minerva Polias, at Priene.

The progress of these various excavations is fully illustrated in these views. Mr. Pullan was, in every case, able to find data for the restoration of these celebrated buildings. The architectural drawings are now in the archives of the Society of Dilettanti, who published them in 1878. It must be remembered that these views are exhibited, not as works of fine art, but simply as illustrations of the progress of these various scientific expeditions.

### NEW BUILDINGS.

**Glasgow.**—The new warehouse belonging to Messrs. Wylie & Lockhead was opened on Monday. It takes the place of one which was destroyed in 1883. The building is noteworthy in several respects. It is the first building in Scotland where terra-cotta has been used as a building material, and it has been constructed throughout with fireproof material, or material so protected that it cannot be affected by fire. Experience in Glasgow and elsewhere has shown that stone walls become disintegrated under great heat, and that iron columns and beams—at one time considered to be proof against fire—are really a source of danger rather than safety if left exposed to the action of fire and then touched with water after they become heated to a certain degree. The walls of the new building are of hard burned brick throughout, set in cement, the outer walls towards Buchanan Street being faced with terra-cotta, which material is quite indestructible by fire. The whole joists, beams, and roofing are of malleable iron, supported on cast-iron pillars, the spaces between the joists being filled with concrete, which is carried below and above the joists so as to imbed them in the material. The beams are in every case covered with cement, and the iron pillars or supports are cased either with terra-cotta or fireclay, so that the whole ironwork is thoroughly protected. There are no open fires in any part of the premises, the heating being done by steam pipes. The only combustible material used is in the necessary wood shelving and counters and wood floor, and even if this woodwork became ignited by any chance, it might be allowed to burn itself out without hurt to the structure. The architecture adopted is Italian Renaissance, a style which has permitted the architects to take full advantage of the facilities afforded for ornamenting the terra-cotta when in a plastic state. Architectural effect is obtained by the substantial-looking pillars and good general proportions of the interior. The external effect of the building has attracted a good deal of attention during its progress, both from the novelty of the design and the material used. With the maximum of window space possible, both on the lower and upper floors, the building, by the arrangement of the main piers, which rise from the street level, looks as if it had proper support from the basement, instead of appearing to be supported on sheets of plate-glass like many warehouse buildings. The terra-cotta was made in Cornwall, from a local clay mixed with a proportion of Devonshire china clay. The whole of the ornamental work was specially designed for the building, and the models made in the city. Compared with stone, an ornamental building of this kind is less expensive, even in Glasgow. The architects were Messrs. Campbell Douglas & Sellars. The

mason and brick work, the building of the terra-cotta, and the carpenter and joiner work have been done by Mr. Alexander Eadie; the malleable iron work by Messrs. P. & W. M'Lellan; and the plaster work by Mr. James Caird. Mr. Alexander Shand was clerk of works.

**Drill Hall, Glasgow.**—A new building for the 5th Lanark Rifles is about to be constructed in Hill Street. Mr. J. B. Wilson has been appointed architect. A writer in a local newspaper, in referring to the work, says "Captain Wilson left nothing undone to secure the erection of a structure in every way fitted to the requirements of the Southern Regiment, and his brethren of the 2nd Northern will, I doubt not, fare equally well at his hands. The hall of the 3rd is to be opened on the 9th prox. with a promenade concert and distribution of prizes, the proceedings beginning at noon with a supplementary bazaar."

### CHURCH BUILDING AND RESTORATION.

**Cheadle.**—The chancel of the ancient parish church of St. Peter, Alton, has been reopened. The west tower, built in the fourteenth century, has been thoroughly and carefully restored, and the chancel remodelled in careful conformity with the original style. The new roof and choir stalls are in English oak. A new organ-chamber has been erected on the south side of the chancel. The nave, with its twelfth-century Norman arcade buried to the depth of two feet below the present floor, has yet to be restored. Mr. J. R. Naylor, of Derby, was the architect, and Mr. J. Fielding, of Alton, the builder. The total cost of the work will be upwards of 1,700*l*.

**Alderminster.**—The interesting old church of Alderminster, five miles from Stratford-on-Avon, has been reopened. The church dates back to the year 1193; it was consecrated in 1200, and given to the monastery of Pershore. It is a perfect cruciform building. Twelve years ago the restoration began, and the chancel and north and south transepts completed. A few years ago the south wall of the nave fell in, and this part of the building had to be held together with timber supports. About 3,000*l*. was spent upon the first portion of the restoration work. The rebuilding of the nave was begun last June. It was found absolutely necessary to take down the walls. The full cost of the restoration, now that the scheme is completed, is about 5,000*l*. The work has been carried out by Mr. Collins, of Tewkesbury, under the direction of Mr. Preedy, architect, of London.

**Wormington.**—The parish church has been reopened after restoration. The church is dedicated to St. Catherine, and consisted of chancel, nave, aisles, and tower with three bells. The work was done by Mr. T. Hopkins, contractor, from plans by Mr. Henry Kennedy, of Bangor.

### GENERAL.

**Mr. R. Knill Freeman** has been appointed architect for the new church of Holy Trinity, South Shore, Blackpool.

**The Architectural Association** held an ordinary meeting on the 24th ult., at which Mr. R. C. Pink was nominated as president, and Mr. J. A. Gotch and Mr. W. H. Atkin Berry were nominated as vice-presidents for the ensuing session. The report of the meeting is held over unavoidably till next week for want of space.

**The Westminster Restoration Committee** have, it is said, agreed to recommend the adoption of Mr. Pearson's plans for the erection of the double cloister along the west wall, with the projecting building at the north end. Sir Charles Barry's plans are to be carried out for the completion of St. Stephen's Porch.

**The School of Design** in Gilmour Street, Paisley, has been sold to the Town Council at the upset price of 4,000*l*. The school is contiguous to the old prison, which was recently acquired by the Corporation for 6,000*l*., and both of these buildings it is proposed to utilise for municipal purposes. A new School of Design is to be erected, as at present proposed, on a site near the Museum and Free Library in High Street. Meantime, the classes will continue to meet in the school in Gilmour Street, the directors paying a rent of 60*l*. to the Town Council.

**A Memorial Tablet** has been erected in St. John's Church, Deptford, to the memory of the Rev. J. Astbury Aston, late vicar of the parish. The design, which was entrusted by the Memorial Committee to Messrs. Newman & Newman, architects, is Late Decorated, and has been executed by Messrs. J. W. Seale & Son.

**A Committee** has been formed in Bedford to collect funds for the erection of two churches—one in the parish of St. Mary, the other in a district to be formed out of portions of the two parishes of St. Peter and Holy Trinity.

A Business Supplement

# The Contract Reporter.

to The Architect.

LONDON, MAY 2, 1885.

## PAVING STONES.

A PAPER was read at the last meeting of the Liverpool Engineering Society by Mr. Charles H. Darbishire, A.M.I.C.E., on "Quarrying and the Preparation of Setts." The paper commenced by pointing out that the term "quarry" meant, primarily, the place where the stone was hewn and squared, whereas now it means the place where it is won from the rock, and not necessarily where it is squared. Attention was called to the fact that the dressing of stone, as far as is known at present, was probably one of the first accomplishments man possessed when the race became distinctly human, and that in every age quarrying stone and working it up to serve a useful, or even merely an ornamental, purpose has always been one of the leading industries. At the present day, when traffic has become concentrated into comparatively narrow streets of cities and towns to the extent it has done, exceeding frequently 200,000 tons per yard width of street per annum, the preparation of stone for paving to meet the exigencies of the case is of the greatest importance. The quarry described is situated at Penmaenmawr. The system adopted was fully dealt with, the various duties of the different sets of men being carefully gone into. Examples of the tools in use were exhibited, and they appeared simple enough in themselves, but it was explained that the art lay in using them skilfully. The paper concluded with a brief comparison of the system practically in force throughout North Wales with that under which quarrying is carried on in the large quarries of England.

## THE CORINTH CANAL.

THE last information regarding the canal at the Isthmus of Corinth is as follows:—The works connected with the cutting through of the Isthmus of Corinth will now enter upon a new phase. The two large dredges, *Isthmia* and *Poseidon*, are now quite ready. The changes required in order that they should work properly are about being completed, for when the ordering of these colossal machines was undertaken, only the quality of the soil as at first excavated was taken into consideration; but when, subsequently, it was found that at greater depths the soil varied in quality, new and important alterations to the dredges were necessary, and this has caused the delay in commencing work with them.

The *Poseidon* well commenced work on the Corinth side of the Isthmus about the end of January, and the *Isthmia* about a fortnight later on the Calamati side. Each of the enormous dredges (the largest existing in the world at this moment) is of 300 horse-power. The main chain has 24 buckets attached to it, each of a capacity of 750 lbs., so that on favourable soil each dredge can extract 500 cubic metres of mud per hour. We think, however, that, taking into consideration the variety of the sub-soil on the Isthmus, each dredge is not likely to extract more than 400 cubic metres; this added to what will be dug daily from the sur-

face by other machines. This result will of course not be obtained until the machines are thoroughly understood and in full working order; but it is nevertheless evident that the cutting through of the Isthmus of Corinth will be carried out within the specified time (three years more). Four steam-tugs of various sizes will also be working in conjunction with the dredges. The engineers of the company have lately been engaged in experimentalising on various rocks by hydraulic pressure in order to ascertain whether by this method they would be able to remove the larger blocks. An engine of 50 horse-power and the requisite pumps drive the water from the sea to a distance of 600 metres into iron cylinders, whence it is distributed under a pressure of 10 kilos. to the various pipes by which the soil is searched. Up to this no such trial has been made in Europe. On this account these trials at Corinth are of great interest.

## COMPETITIONS OPEN.

WHITCHURCH.—May 9.—Designs are requested for a Small Cottage Hospital. Major Lee, Whitchurch.

## CONTRACTS OPEN.

ABERDARE.—May 6.—For Building Board School for 227 Boys, in Extension of Cwmaman Schools. Mr. R. Orton Gery, Town Hall, Aberdare.

ALCESTER.—May 11.—For Building Sanatorium or Hospital, with Administrative Buildings. Messrs. Harris, Martin & Harris, Architects, 119 Colmore Row, Birmingham.

ALVES.—May 12.—For Additions and Repairs to Farm Steading, Earnside. Messrs. A. & W. Reid, Architects, Elgin.

AYLESBURY.—May 6.—For Building Three Pairs of Cottages at the Asylum, Stone. Mr. W. F. Taylor, County Surveyor, 25 New Road, Aylesbury.

BALTINGLASS.—May 4.—For Building Dispensary, Residence, &c., Rathvilly. Mr. H. R. Newton, C.E., 202 Great Brunswick Street, Dublin.

BATTLE.—May 13.—For Construction, &c., of Pump. Mr. A. J. Aitchison, C.E., 38 Parliament Street, Westminster.

BICESTER.—May 4.—For Building Retort House, Engine and Meter House, Alterations to Gasholder and Buildings. Mr. Percival Walsh, Secretary to the Gas Company, Bicester.

BLAYDON.—May 5.—For Building Sixteen Cottages. The Co-operative Society, Church Street, Blaydon.

BOSTON.—May 9.—For Building Farmhouses, Navenby and Fishtoft. Messrs. C. Kirk & Sons, Architects, Sleaford.

BOURNEMOUTH.—May 2.—For Constructing Band Stand on Pier Head. Mr. R. W. Peregrine Birch, C.E., 2 Westminster Chambers, Victoria Street, S.W.

BRADFORD.—May 4.—For Building Board School, Fairweather Green. Mr. E. P. Peterson, Architect, New Inn Buildings, Thornton Road, Bradford.

BRAINTREE.—May 6.—For Alterations and Additions to Union Workhouse. Mr. C. Pertwee, Architect, Chelmsford.

BRAY.—May 6.—For Building Dispensary House. Mr. W. Sterling, Architect, 107 Stephen's Green, Dublin.

BRERETON.—May 4.—For Erection of Buildings, Brown Edge House. Mr. W. Woolley, High Street, Congleton.

BRIGHTON.—May 4.—For Building Enclosing Wall, Lewes Road. Mr. Philip C. Lockwood, C.E., Town Hall, Brighton.

BRITON FERRY.—May 11.—For Alterations and Additions to Police Station. The Clerk of the Peace, Westgate Street, Cardiff.

BRYNWERN.—For Building Residence, Stables, Coachman's House, Garden Walls, and Lodge. Mr. Stephen W. Williams, Architect, Rhayader, Radnorshire.

BUNDORAN.—May 20.—For Excavation of Channel in Rock (400 feet), Construction of Boat Slip and Platform, Landing Quay (165 feet), and Inclined Approach. Plans, &c., at the Office of Public Works, Dublin.

BURNLEY.—May 13.—For Erection of Municipal Buildings, Police Courts, and Public Baths. Mr. H. Holtom, Architect, Bond Street, Dewsbury.

BURNOPFIELD.—May 2.—For Building Six Houses. The Co-operative Society, Blaydon.

BURY.—For Excavation for Cellars and Trenches for Foundations, Walshaw Hall. Mr. James Farrar, C.E., 12 Market Street, Bury.

BURY.—May 2.—For Building Fireproof Mill. Messrs. Stott & Sons, Architects, 12 Clegg Street, Oldham.

BYKER.—May 2.—For Building Board Schools for 1,000 Children. Mr. R. J. Johnson, 3 Arcade, Newcastle-on-Tyne.

CAEGURWEN.—May 2.—For Building Mission Church. Mr. E. H. Lingen Barker, Architect, Hereford.

CANNOCK.—May 5.—For Building Board School for 300 Infants at Chadmoor. Mr. Benjamin Baker, Architect, Free Library Buildings, Lichfield Street, Willenhall.

CHELSEA.—May 6.—For Sanitary Turret and Alterations at Old Offices, Arthur Street. Messrs. A. & C. Harston, Architects, 15 Leadenhall Street, E.C.

CLARENDON GRAVING DOCKS.—May 4.—For Construction of Steam Boiler for Pumping Machinery. Mr. T. R. Salmond, Harbour Engineer, Belfast.

COLNE AND MARSDEN.—May 25.—For Forming Brick Barrel Sewer; Building Piers, to carry a wrought-iron Trough; the Raising of an Occupation Road; Laying Iron and Earthenware Pipes, 960 yards. Mr. Henry Bancroft, C.E., 83 Mosley Street, Manchester.

CORNWALL.—May 9.—For Erection of Clubhouse and Buildings, Cornwood, and Schoolmistress's Cottage, Lutton. Messrs. Oldreive & Hingston, Land Agents, Totnes.

CRONDALL.—May 6.—For Alterations and Additions to Mansion at Redfields. Mr. J. A. Eggar, Architect, Farnham, Surrey.

DALTON.—May 4.—For Building Three Shops and Dwelling-houses. Mr. G. Lawrence, Market Street, Dalton.

DEWSBURY.—May 4.—For Supply of Retorts, Fire Bricks, &c. Mr. H. Townsend, Engineer, Saville Town Gasworks, Dewsbury.

DEWSBURY.—May 6.—For Building Shop, House, &c., George Street. Mr. H. B. Buckley, Architect, Old Vicarage, Batley.

DUDLEY.—May 2.—For Building Chapel, Old Hill. Mr. J. Meachem, Cradley.

DUBLIN.—May 5.—For Construction of Public Swimming Baths, Tara Street. Mr. D. J. Freeman, City Architect, Municipal Buildings, Cork Hill, Dublin.

ELGIN.—May 2.—For Additions to Farm Steading and Dwelling-house. Messrs. Macbey & Gordon, Surveyors, Elgin.

ELGIN.—May 9.—For Additions and Alterations to Farm Buildings. Messrs. MacBey & Gordon, Surveyors, Elgin.

ELGIN.—May 8.—For Additions to Farm Buildings. Mr. H. M. S. Mackay, Surveyor, Elgin.

FULFORD.—May 7.—For Building Two Semi-detached Villas, Heslington Lane. Messrs. Fisher & Hepper, Architects, 16 Castlegate, York.

FULHAM.—May 9.—For Completion of Medical Superintendent's House, Lodge, Stores, Reception-rooms and Discharge-rooms, Western Hospital. Messrs. A. & C. Harston, Architects, 15 Leadenhall Street, E.C.

GLASGOW.—May 4.—For Verandah Roofing for Shields and Paisley Canal Stations and Ayr Passenger Station. Drawings, &c., at the Engineer's Office, St. Enoch Station, Glasgow.

GRAYS.—May 9.—For Building Hotel, Tap, and Two Shops. Mr. E. Clerk Allam, Architect, 63 Finsbury Pavement, E.C.

GUILDFORD.—May 13.—For Building Post Office. The Postmaster, Guildford.

HALIFAX.—May 1.—For Building Eight Dwelling-houses. Messrs. Geo. Buckley & Son, Architects, Waterhouse Street, Halifax.

HALIFAX.—May 4.—For Painting Works at Parks. Mr. Escott, Borough Engineer, Town Hall, Halifax.

HALIFAX.—May 4.—For Building Twelve Houses, Savile Park Street. Mr. Joseph Wilson, Architect, Queen's Road, Halifax.

HALIFAX.—May 8.—For Building School Chapel. Mr. James Farrar, Architect, Crossley's Buildings, 29 Northgate, Halifax.

HALIFAX.—May 18.—For Building Shops at Cross Hills. Messrs. Jackson & Fox, Architects, 22 George Street, Halifax.

HASTINGS.—May 11.—For Building Board School for Infants, Clive Vale. Messrs. Elworthy & Son, Architects, London Road, St. Leonards-on-Sea.

HECKMONDWIKE.—May 8.—For Building Four Through Retort Vaults and Setting Twenty Through Retorts, also for Hydraulic Mains, Mouthpieces, and other fittings in connection with Bed of Forty Retorts. Mr. John Green, Manager, Gasworks, Millbridge, Liversedge.

HEYWOOD.—May 5.—For Wrought-iron Retort House and Coal Store Roofs, Hydraulic Mains, Foul Mains, Valves, Retort Fittings, Ascension Pipes, &c. Mr. H. Hawkins, Engineer, Gasworks, Heywood.

HEYWOOD.—May 5.—For Building Retort House, Coal Stores, Retaining Walls, &c. Mr. H. Hawkins, Engineer, Gasworks, Heywood.

HEYWOOD.—May 5.—For Building and Setting 28 Retort Benches, 196 Retorts, and 2 Chimneys. Mr. H. Hawkins, Engineer, Gasworks, Heywood.

HIPPERHOLME.—May 2.—For Building House and Shop. Mr. Joseph Wilson, Architect, Queen's Road, Halifax.

HORWICH.—May 11.—For Building Shops for Locomotive Engines. Plans at the Engineer's Office, Hunt's Bank, Manchester.

HYDE.—May 5.—For Alterations to Station. Plans at the Engineer's Office, 28 London Road, Manchester.

ILKESTON.—May 5.—For Building Retort Beds, Fitting Shop, Chimney-shaft, and other Buildings and Brickwork of Retort-house. The Manager, Gasworks, Rutland Street, Ilkeston.

INNISHOWEN.—May 4.—For Constructing Reservoir, &c. Mr. C. E. Stewart, C.E., Pump Street, Londonderry.

IPSWICH.—For Remodelling and Enlarging Girls' Industrial Home. Mr. E. F. Bisschopp, Architect, 32 Museum Street, Ipswich.

ISLE OF WIGHT.—May 5.—For Extension of Chancel of Yarmouth (Isle of Wight) Church. Messrs. John Colson & Sons, Architects, 45 Jewry Street, Winchester.

KEIGHLEY.—May 11.—For Building Residence, Highfield Lane. Mr. W. H. Sugden, Architect, 25 Victoria Terrace, Keighley.

KEITH HALL.—May 2.—For Building Farm Offices. Messrs. Jenkins & Marr, Architects, 16 Bridge Street, Aberdeen.

KELSO.—May 6.—For Additions to Farm Buildings. Messrs. M'Gibbon & Ross, Architects, 92 George Street, Edinburgh.

KENDAL.—May 2.—For Reseating Church and Alterations. Mr. Robert Walker, Architect, Windermere.

KINGSWEAR.—May 2.—For Building Retaining Wall and Landing Steps adjoining Yacht Club. Messrs. Best & Commin, Architects, Exeter.

KIRKBY-IN-FURNESS.—May 5.—For Building Eight Dwelling-houses, Four Lane Ends. Mr. J. S. Moffat, Architect, 10 Scotch Street, Whitehaven.

KNIGHTON.—May 20.—For Erection of Workhouse Buildings. Mr. Edwin H. Deacon, Clerk to the Guardians, Knighton, Radnorshire.

LANDPORT.—May 5.—For Enlarging Post Office. The Postmaster, Landport.

LEEDS.—May 4.—For Enlarging Board School, Burley Road. Mr. R. L. Adams, Architect, Imperial Buildings, Bond Street, Leeds.

LEEDS.—May 4.—For Building St. Alban's Vicarage. Mr. W. S. Braithwaite, Architect, South Parade, Leeds.

Established 1820.]

INTERNATIONAL HEALTH

3 Silver and 4 Bronze Medals

[Telephone No. 3,525.]

EXHIBITION, 1884.

Awarded for Sanitary Appliances.

# HENRY CONOLLY.

LIMITED,  
MANUFACTURING SANITARY ENGINEERS,

Call the attention of Architects, Surveyors, and Builders to their Closets, the advantages of which will be readily seen by the accompanying Illustration.

## THE "SAFETY" VALVE WATER-CLOSET,

WITH

Conolly's Reversible Trap (Patent No. 3,754).

This drawing illustrates an improvement in the trap of a Closet, which admits of the outlet being placed in any position to suit the soil-pipe. This object is attained by means of a collar, which is similar in shape to that of an ordinary Valve-Closet. The base of the collar being round is flanged A; this is attached to a corresponding flange B, formed on the end of Trap by means of screw bolts, and from the drawing it will be seen that the outlet can be fixed in any position. It is obvious that this system can be adopted in every case where a separate Trap is employed.

The "Safety" Valve Water-Closet, like the "Nestor" as regards the Basin, is made with a cast lead trap above the floor line. The Trap is constructed so that the water-line is within 1½ in. of the seating of the Closet; therefore it will be seen if there become any defect in the indiarubber seating, the trap still remains sealed; by this means the necessity of a ventilating pipe is also dispensed with, also the old system of having a weepin pipe from the supply to the Lead Trap fixed in the box of Closet, there being no space for the generation of gases. The overflow arm is also protected from the possibility of soil corroding the edge of pipe, as the clack is made to open against it.

CAN BE SEEN IN ACTION IN NEW SANITARY SHOW-ROOM.

53 & 55 Hampstead Road, 169 & 171 Drummond Street.  
WAREHOUSES—TOLMERS SQUARE, N.W.

LEEDS.—May 5.—For Additions to Chapel and Refurnishing. Mr. T. Howdill, Architect, 40 Park Lane, Leeds.

LEEDS.—May 19.—For Supply of Untrapped Earthenware Gulleys. The Town Clerk, Leeds.

LENTON.—For Building Five Pairs of Villas, Osmaston Estate. Mr. Ernest R. Ridgway, Architect, Long Eaton.

LIMERICK.—May 4.—For Works for Cashen River Drainage District. Mr. W. Barrington, jun., C.E., Clare Chambers, 10 George Street, Limerick.

LLANELLY.—May 12.—For Building Infant School with Boundary Wall and Offices at Lakefield. Mr. E. H. Lingen Barker, Architect, 6 King Street, Hereford.

MARYBOROUGH.—May 4.—For Additions and Alterations to Town Hall. Mr. H. Shaw, Architect, 5 Westmoreland Street, Dublin.

METHLEY.—May 4.—For Construction of Sewerage Works. Mr. T. Fenwick, C.E., 1 Park Place, Leeds.

MONTROSE.—May 5.—For Reconstruction of Inch Bridge. Messrs. Leslie & Reid, 72A George Street, Edinburgh.

MORLEY.—May 7.—For Alterations to Morley Hall. Mr. Wm. Bakewell, Architect, 38 Park Square, Leeds.

MOUNTAIN ASH.—May 11.—For Alterations and Additions to Police Station. The Clerk of the Peace, Westgate Street, Cardiff.

NELSON.—May 2.—For Building Eight Houses, with Garden and Retaining Wall. Messrs. T. Fryer & Co., Nelson.

NELSON.—May 7.—For Building Weaving-shed and Premises. Mr. T. Bell, Architect, Arcade Chambers, Nelson.

NEWCASTLE-ON-TYNE.—For Building Central Co-operative Stores. Mr. Edward Shewbrooks, Architect, 2 Market Street, Newcastle-on-Tyne.

NEWCASTLE-UNDER-LYME.—May 11.—For Building Infirmary, Remodelling Portions of Existing Buildings and other Works. Mr. J. Blood, Architect, Guardian Chambers, Newcastle-under-Lyme.

NEW FOREST.—For Constructing Road. Mr. T. A. Skelton, Architect, 2 Portland Street, Southampton.

NEWPORT.—May 20.—For Construction of Two Improved Beale's Patent Gas Exhausters. The Engineer, Gas Offices, Mill Street, Newport, Mon.

NEWTOWN.—May 5.—For Taking Down and Rebuilding the Dorchester Arms. Mr. W. H. Mitchell, Architect, Portland Street, Southampton.

OLDHAM.—May 2.—For Building Congregational Sunday-schools. Mr. Alexander Banks, Architect, Oldham.

OSSETT.—May 2.—For Supplying and Fixing of Iron Roofing for Shed, Cast-iron Gutters and Pillars, and other Castings, and Iron Sliding doors, at Brook's Mills, Flusshdyke. Mr. R. S. Firth, Architect, Bank Street, Ossett.

PATRICROFT.—May 4.—For Draining, Laying Mains, &c., on Sewage Farm. Mr. C. C. Hooley, C.E., Green Lane, Patricroft.

PILNING.—May 5.—For Construction of Passenger Station. Plans at the Engineer's Office, Paddington Station.

PRESTWICH ASYLUM.—May 13.—For Constructing Circular Concrete Tank with Vaulted Roof. Mr. H. Littler, Architect, Bow Chambers, Cross Street, Manchester.

SALFORD.—For Construction of Covered Reservoir. Mr. A. Jacob, C.E., Town Hall, Salford.

SALTBURN.—May 11.—For Building large House. Mr. W. Peachey, Architect, Scarcroft Road, York.

SELBY.—May 9.—For Building Cemetery Chapel, Boundary Walls, Gates, &c., and forming Cemetery. Mr. W. H. Brayshaw, Surveyor, 45 Finsbury Pavement, E.C.

SHERBORNE.—May 18.—For Construction of Covered Reservoir and Valve Well; Providing and Laying 8,500 yards of Cast-iron Pipes, with Special Castings, &c.; Sluice Valves, Hydrants, and other Fittings; and other Works. Mr. James Mansergh, 3 Victoria Chambers, Victoria Street, London, S.W.

SHEFFIELD.—May 4.—For Building House, Dore Road. Mr. J. B. M. Withers, Architect, 5 Surrey Street, Sheffield.

SHILDON.—May 13.—For Building Waggon and Smiths' Shops. Mr. W. Bell, Architect, Railway Offices, Darlington.

SHIRLEY AND CHILWORTH.—May 14.—For Constructing Two Covered Reservoirs and Small Engine House. Messrs. Easton & Anderson, C.E., 3 Whitehall Place, S.W.

SILVERDALE.—May 4.—For Additions and Alterations to Co-operative Stores. Messrs. Thos. Lewis & Son, Architects, Nelson Place, Newcastle-under-Lyme.

SOUTHAMPTON.—For Building Residence. Mr. J. O. Parmenter, Architect, Kingsfield, Southampton.

SWANSEA.—May 6.—For Supply of Cast-iron Pipes, Irregular Pipes, and Castings for Water Supply Purposes during three years. Mr. R. H. Wyrill, Borough Surveyor, Guildhall, Swansea.

SYDNEY.—June 1.—For Steel Bridge to Carry Double Line of Railway over the River Hawkesbury. Mr. S. Samuel, Agent-General for New South Wales, 5 Westminster Chambers, S.W.

TORQUAY.—May 11.—For Building Cottage, Kennick Reservoir. Mr. T. S. Weeks, C.E., Waterworks Offices, Town Hall, Torquay.

TOWCESTER.—May 13.—For Erection of Cemetery Buildings, Laying-out Cemetery, &c. Mr. H. Packer, Clerk to the Burial Board, High Street, Towcester.

TRURO.—May 13.—For Erection of Farm Buildings, &c. Mr. A. Michelmores, Tregothnan Office, Truro.

TYLDESLEY.—For Building Wesleyan Chapel. Mr. H. Isitt, Architect, Queen Anne Chambers, Bradford.

UPPER WORTLEY.—For Building House, Shop, and Shed. Mr. C. H. Thornton, Architect, 3 Park Row, Leeds.

WALSALL.—May 7.—For Alterations to Borough Offices, Bridge Street. Mr. John R. Cooper, Town Clerk, Walsall.

WHICKHAM.—May 5.—For Billiard-room, Conservatory, &c., Dunston Hall. Mr. F. R. Wilson, Architect, Alnwick.

## VENETIAN ENAMEL MOSAIC FOR MURAL DECORATION.

Mosaic Works conducted on the same principle as in Venice and Rome by

**A. CAPPELLO,**  
472 KING'S ROAD, CHELSEA, LONDON, S.W.  
Established in 1880.  
15 YEARS IN ENGLAND WITH DR. SALVIATI.

The above Factory is established in London for the purpose of making the Venetian Enamel Mosaic Work an English trade, and to reduce the cost to half the price that has been hitherto charged abroad or by the London agents.

See "Building News," Oct. 12, 1883, in reference to the Mosaic Pictures for the new Church of the Brompton Oratory, executed by this Establishment.

Gold Enamel Mosaic Work at 15s. per sq. ft.  
Venetian Enamel Mosaic Figure Work at 20s. per sq. ft., including expenses of Fixing.

**MOSAIC PAVEMENTS.**  
TO  
**ARCHITECTS, BUILDERS,  
AND  
CONTRACTORS.**

## STEEL CUT NAILS!!

The modern and important discovery in the process of making Steel has so reduced the price, that Steel Cut Nails of the well-known "Mitre Brand" can now be supplied at only 1s. 6d. per cwt. more than the price of the ordinary Common Iron Cut Nails.

The Steel Cut Nails are far superior in quality and more uniform in size than any wrought or hand-made Nails yet produced, and being lighter in weight than ordinary Iron Cut Nails and free from wasters, they are found cheaper in actual use than common Iron Cut Nails at 1s. 6d. p. cwt. less.

These Steel Cut Nails are specially suited for Builders, Joiners, Coopers, Packing-Case Makers, &c., and a single trial is sufficient to convince any one of their superior quality and cheapness.

**PATENT WROUGHT STEEL NAILS.  
OVAL WIRE NAILS.**

Ask your Factor or Ironmonger for  
"MITRE NAILS."  
WHOLESALE AND EXPORT ONLY.

FIRST-CLASS CERTIFICATE AND SILVER MEDAL  
AT CALCUTTA EXHIBITION.

**R. GARDINER & SONS**  
BRISTOL

SPECIALITIES:—  
WROUGHT IRON SHEDS & CRANES  
DOMESTIC LIGHTS & CONCRETE FLOORS

Shakespeare Steam Printing  
Works,  
COLMORE ROW,  
BIRMINGHAM.

## FIXING BLOCKS.

**WRIGHT'S FIREPROOF FIXING BLOCKS.**  
(PATENTED 1881.)

For Skirtings, Dados, Matchboarding, Linings, &c., superseding Wood Grounds and Backings, without extra cost. Special Sections are now made for fixing Floor-boards to Concrete or Fireproof Floors, omitting Joists, saving Depths, and preventing Spaces or the accumulation of Dirt and Dust. Fireproof Plate for Joists, &c., &c.—  
**GEORGE A. WRIGHT, 3 Westminster Chambers, Victoria Street, S.W.**

**DAMP WALL PAPER,** in 10yd. rolls, 40 inches wide, 2d. per yard. Sample roll, Parcel Post, 2s. 6d. Antiseptic, damp-proof. Try it.  
**CHEMICAL PAPERS CO., LTD., Lombard Ct., London, E.C.**

**SAND. SAND.**  
BEST AND CHEAPEST FOR BUILDERS' PURPOSES.  
Guaranteed Sharp and Clean.  
For sample, price, railway and canal rates, apply to  
**E. J. BISHOP & SONS, Sand Pits, Leighton Buzzard.**

**SERPENTINE.**  
**QUARRIES and WORKS,**  
POLTESCO, near the Lizard, Cornwall.  
Estimates forwarded on application to the Proprietor  
**JABEZ DRUITT,**  
SOUTH GROVE, MILE END ROAD, LONDON.  
Or the Manager at the Works.  
Show Room for Chimney-pieces, 9 Castle Street, Holborn.

**CASES FOR BINDING THE ARCHITECT.**  
Price 2s.—Office: 175 Strand, London, W.C.

WHITTINGHAM.—May 18.—For Building Hospital for Infectious Cases. Mr. Lawrence Booth, Architect, 28 Faulkner Street, Manchester.

WIGAN.—For Building Semi-detached Houses. Mr. H. Isitt, Architect, Queen Anne Chambers, Bradford.

GRUNDY'S PATENT

WARM-AIR

VENTILATING FIRE GRATE.

The novelty, superiority, and advantage of this patent consist in the heating surface being greater than any other Fire-grate introduced to the public. It is very simple in construction, and is made in the form of a Stove, the back of which is semicircular in shape, with gills behind and smoke-nozzle on top, all cast in one piece. The same can be attached to any design of a Register or Stove front. It is very suitable for schools, class-rooms, waiting-rooms, hospitals, offices, dormitories, and dwelling-houses, from the cottage to the mansion. Design and specification post free on application.

TESTIMONIALS.

"9 Victoria Chambers, Westminster, S.W.

"June 10, 1884.

"SIR,—I have much pleasure in testifying to the efficiency of your patent Warm-Air Fire Grate. It has been very successful, and given every satisfaction where I have used it.

Yours, &c.

"To Mr. Grundy.

JAMES WEIR, F.R.I.B.A."

"Baptist Chapel, Clapham Common, London. Richard

Webb, Pastor, 10 Grafton Square.

"February 15, 1884.

"DEAR MR. GRUNDY,—I have pleasure in testifying to the excellency and efficiency of your patent Fire-Grate. It is the most charming invention for heating a large room I have ever known. I shall have pleasure in showing it to anyone who wish to have their schools or rooms pleasantly and efficiently heated."

From James Garry, Esq., Architect, West Hartlepool,

July 1884.

"DEAR SIR,—I have very great pleasure in stating that the first stove, or patent warm-air ventilating fire grate, adopted by me in school at Seaton, and a second in a Cocoa Palace, have given such satisfaction that I now order eleven to be inserted in New Upper Grade Schools in course of erection at West Hartlepool. They are the most economical, efficient, and easily managed stove at present before the public.

"Mr. John Grundy."

From Hon. and Rev. G. G. C. Talbot, M.A., Withington,

Cheltenham.

"DEAR SIR,—You will be gratified to hear that the school is completely warmed by your new grate. It is the most economical and efficient that I have ever seen.

"Mr. John Grundy."

From F. J. Yates, Esq., Architect, Birmingham.

"The best of the kind I have seen. I shall have pleasure

in securing their adoption whenever opportunity offers."

# THE GREAT PROBLEM OF THE XIX<sup>TH</sup> CENTURY.

# VENTILATION

# WITHOUT DRAUGHT.

The hitherto unsolved problem of "Ventilation Without Draught" is to be seen practically illustrated at FREDERICK HENRY SMITH'S Test Room, No. 68, 52 Queen Victoria Street, E.C., Patentee of the Automatic Siphonic Aspirator System of Ventilation. A personal inspection invited.

*Extract from the Annual Report of the "French Hospital and Dispensary," issued 29th January, 1885.*

We have also to return our best thanks to Mr. Smith, who undertook gratuitously to repaint one of our wards and to apply a new system of ventilation of his own invention, which was very successful.

*Letter from David Urquhart, Assistant Engineer to Colonel Sir Francis Bolton, C.E.*

F. H. SMITH, Esq., 52 QUEEN VICTORIA STREET, E.C.

4 THE SANCTUARY, S.W., LONDON: NOVEMBER 22nd, 1884.

In reply to your inquiry, I have much pleasure in certifying that your system of ventilation as applied to the "Island Room" of the illuminated fountains at the Health Exhibition reduced the temperature during the displays from about 110 deg. to about 70 deg., and thus enabled the men to perform their duties without inconvenience.—Yours faithfully,

DAVID URQUHART.

*Extract from the TIMES of March 14, 1885, page 7.*

"VENTILATION WITHOUT DRAUGHT.—This desideratum appears to be accomplished by a syphonic system devised by Mr. Frederick H. Smith, at whose offices, 52 Queen Victoria Street, London, we recently inspected the arrangement. The air supply is conducted into the apartment from the external atmosphere by means of air ducts, which terminate in distributing passages at the floor level. The exit for the vitiated air is placed in the ceiling, and consists of two tubes, a large and a small one, running parallel to each other between the floor joists in the case of rooms having others over them. In the case of rooms on top floors, or those having the roof directly over the ceiling, the tubes are placed concentrically, but the action and results are the same. The larger of the two tubes carries off the vitiated air, while the smaller one forms an induction tube for cold air, its outer extremity being open to the atmosphere. These two tubes or conduits are so connected that the passage of the heated air through the larger tube induces a current of cold air through the smaller one in a continuous stream. The result is a rapid clearing away of all deleterious gases and products of combustion as they accumulate, and the preservation of a pure atmosphere at an equable temperature in the apartment. In a small room at Mr. Smith's offices in which five large gas-jets were burning, the atmosphere was apparently quite innocuous at the level of about 7 feet, the temperature being about 60 deg. Fahr. At a higher level, however, and especially near to the ceiling, the temperature was high and the air greatly vitiated. It was demonstrated that this vitiated air was being drawn off through the exit tube, which acted as a powerful sucker. After turning off the gas-burners, and upon the temperature of the room generally becoming lowered and equalised, a feeble upward action was still maintained in the upcast tube, but there was no down-draught whatever. The system has already been applied to a church and other buildings with acknowledged success."

**GRANOLITHIC PAVEMENT.**

FROM the judgment which has been delivered by Mr. Sheriff Murray, of Glasgow, in the case Stuart & Co. v. The Scottish Val de Travers Paving Company, it would appear that the word "granolithic" can now be generally used without risk of infringing the Trade Marks Act. His lordship says that the manufacture of a concrete formed by a mixture of crushed granite and Portland cement laid on a foundation of various kinds was a matter free to all the world. The pursuer or plaintiff in the case, Mr. Stuart, adopted crushed granite mixed with Portland cement as his chief manufacture of concrete about ten or twelve years ago. Till 1880 he made it under the name of "granite concrete"; but in that year he adopted the name "granolithic," and got it registered as a trade-mark in November, with the device of a lion rampant supporting a shield, on which the words "Stuart's Granolithic" were printed. The name "granolithic" was a great success. It not only implied that the material was granite, but that it was as hard as a stone. In issuing their schedules, architects, builders, and measurers inserted the word "granolithic" when they wanted offers for granite concrete, quite irrespective of the person who made it. Indeed they issued such schedules to various manufacturers, including pursuers and defenders, showing unmistakably that what they meant by granolithic was the thing, irrespective of the maker. This state of things lasted for two or three years, and the name granolithic thus came into general use as a name for the thing produced, irrespective of the maker's name. Under a new Act the pursuers, on April 29, 1884, registered the word "granolithic" by itself as a trade mark. By this time, however, the word was in general use among architects, builders, and measurers as applied to the manufacture, not only of the pursuers, but other manufacturers. There was really no question in this case of the defenders' misleading, whether in-

tentionally or unintentionally, any person whatever into believing that they were getting Stuart's article when they were really getting defender's article. The defender's circular was perfectly plain, and none but an idiot would suppose that the granolithic there referred to was anything but defender's own work. Laying aside the question of intentional or unintentional misleading, which must be eliminated, Sheriff Murray proceeds to look at the legal aspect of the question, and dealt with five classes of cases, but, in his lordship's opinion, the present one fell under the fourth category—that of *Singer v. Long*—where it was held that a trader has a right to make and sell machines similar in form and construction to those of a rival, and even in advertising to refer to his rival's machines and rival's name, as long as he does so in such a way as to obviate any reasonable possibility of misunderstanding or deception.

**TECHNICAL EDUCATION IN IRELAND.**

THE Commissioners of National Education in Ireland have adopted handicraft as one of the "extra" subjects of the National School programme. The following are the branches of handicraft for proficiency in which result fees may be earned:—

**HANDICRAFT—PROGRAMME FOR MASTERS.**

—To be acquainted with the construction, peculiarities, and uses of the principal tools used in carpentry and joinery, and in any other handicrafts selected by the candidate.

To be acquainted with the various kinds of nails and screws in common use, and to be expert in driving them.

To be acquainted with the chief technical terms used in the handicrafts selected by the candidate. To be prepared to show intelligence and practical expertness in any five of the following (at the choice of the candidate).

1. To prepare and use glue. To plane up the edges of two boards, and glue them together. To make a tenon and mortise joint. To make a simple dovetail joint.

FIRST PRIZE MEDALS from all the leading Exhibitions at Home and Abroad.

2. To dowel two boards together and strengthen them with glue. To rabbet and bead-mould two boards, and join them together, using ledger and either screws or nails.

3. To plane up, rabbet, and mitre-joint four pieces of wood, so as to form a frame for a tablet or picture.

4. To be acquainted with the several kinds of locks in common use, with their peculiarities. To put on a lock, using, if necessary, a board to represent door, box, &c. To take off an old lock. To take a lock asunder and put it together again.

5. To be acquainted with the several kinds of hinges in common use. To put on a hinge of any ordinary shape, using, if necessary, boards to represent door and jamb, box and lid, &c.

6. To be acquainted with the principal ways of scarfing and splicing. To splice any such thing as a broken broom handle, rake handle, pointer, &c., securing the joint with screws or copper wire, or waxed cord. To make a half lap joint.

7. To cut out and make a rail for clothes-rack, screwing on the hooks. To be acquainted with the different kinds of hooks. To know how to fasten up a rail to a wall by simple plaster-nailing as well as by plugging. To understand the construction of several forms of paling.

8. To know the composition of hard and soft putty. To be able to cut glass, using either a diamond or an American glass-cutter. To hack out a broken pane and put in a new one.

9. To have some knowledge of the ingredients of the most important paints. To mix paint of any ordinary colour, and to paint with it. To understand staining. To prepare a board for staining; to stain, size, and varnish it.

10. To understand the nature of soldering. To tin a soldering-iron. To do any plain piece of soldering, such as fixing in the loose handle of a tin vessel, soldering together two pieces of tin, brass, &c. To do plain rivetting.

11. To mount a map with linen, roller, &c. To mount a travelling map for the pocket. To know how to make paste.

12. To mend a break in any common article

of furniture—a chair, a school-desk, &c. To make any small simple article—a stool, a little box for pencils, a nail-box, a drawing-board, &c.

### LIBELLING BUILDERS.

AN action was tried before the Lord Chief Justice and a special jury on Monday, which had been brought by Messrs. Kirk & Randall, the contractors, for the recovery of damages against the proprietors of the *Bullionist* newspaper for libel. Messrs. Kirk & Randall had undertaken the contract for the construction of the docks at Tilbury. Disputes arose, and the contract was handed over to Messrs. Lucas & Aird. The following version of the transaction appeared in the *Bullionist* on October 25, 1884:—

"Work at the Tilbury extension of the West India Docks Company, which has been interrupted by the failure of the original contractors, Messrs. Kelk & Rendell (meaning thereby the plaintiffs), will be actively resumed on Monday next. The new contractors are Messrs. Lucas & Aird."

This was the libel on which the action was founded. The publication was admitted, but the defendants alleged that in publishing it they had acted without actual malice and without gross negligence. They further pleaded that at the earliest possible moment—viz., November 1, 1884—they had inserted a full apology according to the provisions of Lord Campbell's Act (6 and 7 Vict., c. 96), and they had paid into Court a sum of 10*l.* 10*s.*, alleging that to be sufficient to satisfy the plaintiffs' claim. The apology was in these terms:—

"We extremely regret that through inadvertence a paragraph appeared in the *Bullionist* of October 25, asserting the failure of Messrs. Kirk & Randall, the late contractors for the Tilbury extension of the West India Docks. We now learn that there was no foundation whatever for this statement, and we on the first opportunity which presents itself acknowledge our error and hereby offer our earnest apology

to Messrs. Kirk & Randall. We sincerely trust that Messrs. Kirk & Randall have suffered no damage or inconvenience by our mistake."

The writ in this action was issued in October 1884.

Counsel for the plaintiff said that the libel complained of was necessarily of a character to do great injury to persons in the position of the plaintiffs. They had proceeded with the work under their contract with the East and West India Docks Company at Tilbury (under which they were to be paid some 700,000*l.*) up to June 1884. The work had been found to be vastly more difficult than had been anticipated (the soil proving to be quite different from what was expected), that upon the plant, originally estimated to cost only 50,000*l.*, the plaintiffs had, in fact, expended upwards of 200,000*l.* They had claimed to be paid by the dock company upon a basis which the engineer of the latter had refused to acknowledge. The result of this dispute had been that the dock company had taken the work out of the hands of the plaintiffs. There had been no sort of question as to their solvency and stability, and the dispute between the plaintiffs and the company had been solely due to the fact that the parties had taken totally different views of their rights. The defendants must have been guilty of the grossest negligence in publishing that the plaintiffs had failed, as in the issue of their own paper on July 12, 1884, they had given a report of a meeting held about that time of the proprietors of the East and West India Docks Company, in which, from their paper, it appeared that the chairman had said:—"It was said that the works had stopped, that the contractors were bankrupt, and all sorts of things; but this was not true. They had no reason to believe that the contractors could not continue the works, but there had been some technical dispute which would probably be got over in a few days, and if not the Company was quite able to grapple with any difficulty which arose. The condition of the works was most satisfactory. He had been over the whole of them on Wednesday, and very great progress had been made in the last few

ASBESTOS OIL PAINTS, non-corrosive and very durable; suitable for Gasworks, Bridges, Roofing, Wharves, Waggons, &c., &c.

## FIREPROOF PAINT.

Sir FREDERICK BRAMWELL, C.E., F.R.S., Chairman of the Executive Council of the International Inventions' Exhibition, 1885, in referring to the preservation from fire of inflammable building materials, made the following remarks in his Presidential Address at the Institution of Civil Engineers, on January 13th, 1885:—

"The processes, more or less successful, that have been tried are so numerous that I cannot even pretend to enumerate them. I will, however, just mention one, the Asbestos Paint, because it is used to coat the wooden structures of the Inventions' Exhibition. To the employment of this, I think, it is not too much to say those buildings owed their escape, in last year's very dry summer, from being consumed by a fire that broke out in an exhibitor's stand, destroying every object on that stand, but happily not setting the painted woodwork on fire, although it was charred below the surface. I do not pretend to say that surface application can enable wood to resist the effects of a continued exposure to fire, but it does appear that it can prevent its ready ignition."

PAINT DEPARTMENT:— CLEMENT STREET WORKS, BIRMINGHAM.

LONDON OFFICES—THE UNITED ASBESTOS COMPANY (LIMITED), 161 QUEEN VICTORIA STREET, LONDON, E.C.

weeks." The dock company had paid the plaintiffs 120,000*l.* only for the plant, leaving a balance on this account of 80,000*l.* due to them, Messrs. Kirk & Randall; beyond this there were retentions amounting to 35,000*l.* for work done by them; moreover, they had done a large amount of work in the month of June in respect of which the chairman had offered to Mr. Kirk many thousands of pounds while the dispute was going on; so that there were assets amounting to nearly 200,000*l.*, quite apart from the larger claims against the dock company, which was the subject of an arbitration now taking place. The learned counsel, in conclusion, said he should ask the jury for not excessive but reasonable and proper damages for the serious libel which the defendants by their gross negligence published in their paper.

One of the plaintiffs was called, and stated that they obtained their contracts principally through tenders to dock and railway companies. He said their turnover in the last twelve years had amounted to between two and three millions sterling. The witness was not cross-examined.

Lord Coleridge, in summing up, said that it had been urged that the plaintiffs had been compelled to bring this action, and he thought that such was the fact. The plaintiffs were perfectly right to want in open court, by the mouth of their counsel, to state their real financial position. The defendants had met the case in a handsome spirit, and had made the fullest admission that it was impossible for them to deny their negligence, and that there had never been the very slightest foundation for the libel. The action being wholly undefended, it was a mere question of damages, the plaintiffs being clearly entitled not only to more than the 10*l.* 10*s.* paid into Court, but also in any event to a complete indemnity for all the costs to which they might have been put.

The jury, after deliberating in the box for a few minutes, assessed the damages at 250*l.*

Counsel applied for "higher costs," under Order LXV., rule 9.

The Lord Chief Justice said that he supposed the damages would give the plaintiffs a complete indemnity for their costs.

Judgment accordingly for 250*l.*, with costs.

### HIRING BUILDERS' PLANT.

A CASE was argued in the Court of Appeal on Tuesday which is important as showing the state of the law with respect to the hiring of machinery and plant by builders. The circumstances were as follows:—In October 1884, a builder was adjudicated bankrupt in the Croydon County Court, and a trustee was appointed. At the time of the bankruptcy the builder was in possession of certain mortar-making machinery which he had got from Messrs. Reynolds & Co. on "the hire-purchase system," part only of the purchase money, which was payable by instalments, having been paid. This machinery the trustee claimed as having been in the order and disposition of the bankrupt at the time of the bankruptcy. Thereupon Messrs. Reynolds & Co. brought an action of detinue in the High Court against the trustee. The trustee applied to the County Court Judge for an order to stay proceedings in that action, and that he should determine the question of ownership of the machinery. The County Court Judge refused the application, but a Divisional Court, consisting of Mr. Justice Cave and Mr. Justice Wills, reversed the decision, and granted the trustee an injunction restraining Messrs. Reynolds & Co. from proceeding in the action until further order, on an undertaking by the trustee to be answerable for damages and to proceed with the motion in the Court below with due diligence. Messrs. Reynolds & Co. appealed, and it was stated that the result of the action in the High Court would be of great importance to the trade, as it would be sought to set up a hiring custom in respect of machinery of the kind in question so as to take it out of the reputed ownership clauses, as has been done in the case of hotel furniture and pianos.

The Court gave judgment allowing the appeal.

The Master of the Rolls said when the learned County Court Judge had found that the question was whether the alleged constant practice of builders to hire machinery of this kind, for the purposes of their business, was so well known in the trade that nobody dealing with a builder ought to assume that such machinery was his own, he had said he thought it had better be decided by a superior tribunal. It was a question of the greatest importance to tradespeople, and was precisely one which ought to be tried by a superior tribunal, in order that an authoritative decision might be obtained instead of probably conflicting decisions at different County Courts. The County Court Judge had acted most prudently. The Divisional Court, however, had come to a different conclusion. They were of opinion that the County Court Judge had power to issue an injunction, and that he should have done so, and they had therefore granted the injunction themselves. Sect. 100 of the Bankruptcy Act, 1883, no doubt gave the County Court all the powers of the High Court in regard to bankruptcy. But the High Court itself had not the power which it was contended belonged to the County Court, for since the Judicature Act there was no power in one division of the High Court to grant an injunction to restrain an action in another. The appellants were therefore claiming for the County Court a jurisdiction which did not exist in the High Court. The judgment of the Court below must be reversed.

### TRADE NOTES.

THE gas lighting arrangements at the Albert Palace Exhibition are on a very extensive scale. There are three large meters, one 2,000 light meter for the main building, which weighs between eight and nine tons when charged with water; one 1,000 light meter for the concert hall, and one 300 light meter for the picture gallery and side building. Nearly nine miles of mains and wrought-iron gas pipes have been

WILLIAM WHITE,

Head Office and Works:—BELMONT ROAD, ABERGAVENNY.

The ONLY MEDAL for ROOFING TILES at the INTERNATIONAL HEALTH EXHIBITION, 1884, was awarded to

H. J. & C. MAJOR,

Late SEALY. Established upwards of 200 Years.

## THE PATENT TILE WORKS, BRIDGWATER.

Sole Manufacturers of Non Porous ROOFING TILES, of various patterns, having C. Major's Patented Improvements, which, forming a double "rabbet" at the top, bottom, and sides of the Tiles, and avoiding cut or unprotected corners, make a secure lap that PREVENTS "WIND-STRIPPING" and ENTIRELY EXCLUDES DRIFTING RAIN AND SNOW.

Manufacturers of the Imperial Bath Scouring Bricks, Patent and other Roofing Tiles, Bakers' Oven Tiles, &c., &c.

A brick on flat and one on edge will enable for Cottages or where great economy is required. It is quite damp-proof and built in strength to a 4-inch wall built with mortar only.

A wall built two half bricks on the flat is much stronger than an 18-inch wall built in the ordinary way.

used in carrying out the work. The building generally is lighted by groups of lights on large brackets and the galleries are mostly lighted with star lights. There are over 3,000 gas burners in the building, and the whole of the work has been carried out in first-class style by Messrs. Strode & Co., of 48 Osnaburgh Street, N.W., and 67 St. Paul's Churchyard, E.C.

A THREE-LIGHT stained glass window has just been erected in the parish church of Twiggworth, Gloucestershire, representing Our Lord preaching on the Mount. The artists are Messrs. Mayer & Co., of Munich and London.

A NEW pulpit has been made for Earls Heaton Church, by Messrs. Jones & Willis, of Birmingham and London. It is of Riga oak, handsomely carved; the style adopted being in harmony with the church, namely, Early Decorated.

MESSRS. FREDERICK YOUNG & Co., office-fitters, cabinet-makers, &c., have removed from their old premises, at 11 Clerkenwell Green, to new and more spacious premises in Greville Street, Holborn, at the rear of the Prudential Life Assurance Company's offices.

A CARVED oak pulpit, the gift of the late Mr. R. Field, of Grimsbury, has been placed in the parish church, Banbury. Mr. C. Claridge, of Banbury, was entrusted with the work, the carved portions of which were executed by Mr. Ketts, of Cambridge.

A MARBLE altar in SS. Peter and Paul's Roman Catholic Church, Wolverhampton, it is intended will be completed before the feast to the patron saints of the church on June 29 next. The design has been furnished by Mr. Cox, of Birmingham, and the work is being executed by Mr. Wall, sculptor, of Cheltenham. The cost of the altar is 400l.

THE revival of an old form of decorative work has just been very successfully carried out by Messrs. Williams & Nash, of Castle Street, Holborn. This form of marble work has been applied to the erection of a reredos at St. John's College Church, Highbury. Another reredos in the same style is also being erected. The system

is as simple as it is effective. The chief requisites are a richly-veined marble, and this, when cut into segments, and the polished sections placed into proper juxtaposition, gives a pattern as perfect as a wood veneer, and the effect can be multiplied and heightened by using variegated marbles of different colours. Of course it is not every marble that is suitable for this style of artistic inlay, or "veneering," as the revivalists call it, as a grain is essential, and the better defined the grain the better the result. In mediæval times this system was frequently employed. It is claimed that the system is economical, durable, and effective. The reredos mentioned above was executed from the designs of Mr. Ewan Christian.

AN ornamental clock, which was designed by the late Mr. Street, R.A., is now being fixed over the north balcony in the Central Hall of the Royal Courts of Justice. The clock is fitted with a white dial, with black hands and figures.

MESSRS. C. ISLER & Co., of 88 Southwark Street, S.E., have received orders from the Executive Council of the Inventions Exhibition to fix eleven more of their turnstiles, making a total of twenty-six. Fourteen are to be fixed in the subway. These are so arranged that they will register the number of people going in and coming out, the indicator being specially adapted to this purpose. The remaining twelve are fixed at the Exhibition entrances.

MESSRS. HEATON, BUTLER & BAYNE, of London, have had a commission for two large windows for the baptistery of Chesterfield parish church, one of which is now erected, and the other is in course of completion. Both windows are designed in the style of the Italian Renaissance. The subject of one is the Presentation of our Lord in the temple, surmounted by rich Renaissance architecture, the upper portion containing a choir of angels singing praises. *Guardian Angels* is the subject of the other window. The angels are designed in the style of Perugino, and hold appropriate emblems—the lily, rose, crowns of glory, palms of victory, trumpets, censers, &c. In the foreground are a

group of angels, each standing in a devotional attitude, while behind, diminishing in size as they ascend, are groups of flying angels with the above-mentioned emblems. The uppermost piece of tracery contains the name of "Jehovah" in Hebrew characters, a belt of clouds dividing it from the angelic host below. The window is surrounded by architecture of similar character to the previous window.

MESSRS. BRUCE & STILL, of the Mersey Galvanising Works, Norfolk Street, Liverpool, have just issued an admirable illustrated catalogue, which shows in the clearest manner the various capabilities of corrugated iron as a cheap and light material for covering large areas, such as exhibitions, halls, and houses, as well as for the largest or smallest class of shed for manufacturing or agricultural purposes, or for export. The catalogue contains thirty illustrations or designs carefully reproduced by lithography and accompanied by explanatory letter-press, so that a design can be readily selected to form an estimate, the particulars of which, being sent to the firm, they will contract for delivering and erecting the work at home or abroad, or furnish plans if required. To give an idea of the scope of the work it may be mentioned that on referring to the illustrations the design of a hospital for 100 beds is found, arranged in five wards, each 24 feet wide, the spacing of bed from centre to centre about 10 feet, there being two rows of beds in each ward—covered passages connect the wards; there are detached rooms for the nurses, and a large detached building for the medical staff. Then there are designs for a farm steading and buildings, and for a coal depôt, &c. There are designs also for cottages, single-room huts, cabmen's shelters, workshops; designs likewise for a church, school, market, public baths, drill-hall, concert-hall, exhibition buildings, hunting-lodge, cricket pavilion, race-stand, band-stand, boat-house, &c. The catalogue is extremely well got up in every way. No small merit is the clear and intelligible manner in which the information is presented, and that elaboration has not been allowed to take a confusing or complicated form.

**REDUCTION IN PRICES OF TILES.**

Awarded the GOLD MEDAL at the International Health Exhibition.

Size, Forty Inches by Fifteen Inches. Price One Shilling; by post, carefully packed inside patent roller, One Shilling and Threepence.

## SHAKSPERIAN DECORATIVE PANELS.

BY H. STACY MARKS, R.A. (Printed in Colours.)

- |  |                                     |                              |
|--|-------------------------------------|------------------------------|
| 1. Scene from "The Tempest."             | 3. Petruchio and the Tailor.        | 6. Falstaff acting the King. |
| 2. Scene from "Midsummer Night's Dream." | 4. Falstaff in the Buck Basket.     | 7. Parolles' Eyes Unbound.   |
|  | 5. Touchstone, Audrey, and William. | 8. Malvolio in the Garden.   |

Price One Shilling; free by post, carefully packed inside patent roller, One Shilling and Threepence each; or the set of Eight, Five Shillings; by post, Five Shillings and Sixpence.

## The Banquet.

The well-known and beautiful Chromo-lithograph by H. STACY MARKS, R.A.

Size, Thirty-nine Inches by Fifteen Inches. Price One Shilling; free by post, carefully packed inside patent roller, One Shilling and Threepence.

THE FOLLOWING

## PANELS FROM THE CELEBRATED FRIEZE BY JULES DIDIER

ARE STILL ON SALE, viz.:—

|                 |                              |                 |                              |
|-----------------|------------------------------|-----------------|------------------------------|
| HORTICULTURE .  | Size 34 Inches by 14 Inches. | CARPENTRY . . . | Size 19 Inches by 14 Inches. |
| POTTERY . . . . | Size 19 " 14 "               | METALLURGY . .  | Size 19 " 14 "               |
| CONSTRUCTION .  | Size 19 " 14 "               |                 |                              |

The Illustrations are reproduced in Colours, by permission of the FRENCH GOVERNMENT.

Price One Shilling each; free by post, carefully packed inside patent roller, One Shilling and Twopence each.

## The Bard.

FACSIMILE OF CARTOON BY PROFESSOR MAILLART.

Size, Thirty-six Inches by Twenty-two Inches. Price One Shilling; free by post, carefully packed inside patent roller, One Shilling and Threepence.

## THE CLEMENCY OF SCIPIO.

BY GIULIO ROMANO.

From the Painting in the National Gallery.

Size, Thirty-two Inches by Fourteen Inches. Price One Shilling; free by post, carefully packed inside patent roller, One Shilling and Threepence.

## The History of Art.

In Two Plates, reproduced from the Splendid Painting around Cupola, in Place St.-George's, Paris.

BY M. FRANCOIS EHRMANN.

Showing Typical Figures of Ancient and Modern Styles of Art.

Size, Thirty-six Inches by Fourteen Inches. Price One Shilling each; by post, carefully packed inside patent roller, 1s. 3d. each.

## THE AURORA.

BY GUIDO RENI. From the Celebrated Painting in the Rospigliosi Palace, Rome.

Size, Thirty-eight Inches by Twenty Inches. Price One Shilling; free by post, carefully packed inside patent roller, One Shilling and Threepence each. A few tinted proofs may be obtained at Two Shillings and Sixpence each, including postage and packing.

## The Guitar Player.

FROM THE PAINTING BY CHARLES SPRAGUE PEARCE.

Size, Nineteen Inches by Fourteen Inches. Price Sixpence; free by post, carefully packed inside patent roller, Eightpence.

## AN IDYLL.

BY ALBERT HYNAIS. A BEAUTIFUL TINTED INK PHOTOGRAPH.

Size, Nineteen Inches by Fourteen Inches. Price Sixpence; free by post, carefully packed inside patent roller, Eightpence.

May be obtained from all Newsagents or Booksellers, or from the

Publishers, GILBERT WOOD & CO., 175 Strand, London, W.C.

# The Architect.

## THE WEEK.

At the meeting of the Royal Institute of British Architects on Monday, the following members of Council were elected:—*President*: Mr. EWAN CHRISTIAN. *Vice-Presidents*: Messrs. EDWARD PANSON, ALFRED WATERHOUSE, A.R.A., and THOMAS WORTHINGTON. *Ordinary Members*: Messrs. COLE A. ADAMS, GEORGE AITCHISON, A.R.A., JAMES BROOKS, ARTHUR CATES, C. R. CHORLEY, J.P., JOSEPH CLARKE, HENRY CURREY, W. M. FAWCETT, CHARLES FOWLER, JAMES FOWLER, J.P., JOHN GIBSON, E. A. GRUNING, OCTAVIUS HANSARD, Professor T. R. SMITH, and ASTON WEBB, with Mr. J. MACVICAR ANDERSON as Honorary Secretary, and Mr. WILLIAM H. WHITE as Secretary. The new Auditors are Messrs. BANISTER FLETCHER and G. H. BLAGROVE. It will be seen that there are several changes. Mr. CHORLEY, Mr. ASTON WEBB, Mr. CHARLES FOWLER, Mr. JAMES FOWLER, and Mr. GRUNING are new members. The provinces are now represented by one vice-president and three ordinary members. Scotland has no longer a representative, and the retirement of Mr. HONEYMAN will be felt also in Conduit Street. The Council is a strong one, and we shall be disappointed if its influence is not beneficial to the Institute.

THE Exhibition of Inventions was opened on Monday and attracted a great crowd of people. During the past year some alterations have been made in the buildings, and two additional galleries have been erected. But nothing has been done to remove the shed-like character of the structures. The expenditure of a small part of the surplus in skilful painting would enhance the appearance of the place, and in pleasant galleries there would not be so strong a desire to reach the grounds in the shortest possible time. Unless the exhibitors can secure the public attention by some extraneous means, it will be unwise for them to expect that they will be more fortunate than their predecessors. The efforts of the authorities have been mainly devoted to the creation of counter attractions. When the orchestra of STRAUSS, various military bands, and other musicians, have entered into a competition, can the exhibitors expect that people will go systematically through the objects entered in the catalogue? In plain English, the inventions are used to give a zest to the music and illuminations. At present the only parts within the exhibition where visitors seem disposed to stay are the Austrian Court and the neighbourhood of the cannon, torpedoes, and military balloon. Even the splendid engines by Messrs. GALLOWAY have not secured a hold on attention. The exhibition, however, contains a vast number of objects which merit careful study, and it is an answer to those who are fond of extolling foreign productions.

THE caricatures of ANDREW GILL were at one time known to every Parisian. The artist took part in the Commune strife with COURBET, MOULIN, and many another artist and writer. He was for a time one of the directors of the Luxembourg, and aided in preserving the pictures amidst the anarchy. The excitement preyed upon him, and it was found necessary to confine poor GILL in the madhouse at Charenton. When he was considered sufficiently sane to be allowed his freedom he returned to Paris, and instead of small portraits of an exaggerated kind, he surprised his friends by painting a life-size, full-length figure of a lunatic confined in a narrow cell, and apparently representing a brief return of consciousness. It was one of those pictures which haunt a spectator, but it was accepted, and was certainly hung in a good position in the Salon of 1882. GILL was dissatisfied when on the first day of May he found it was not on the line, and the disappointment affected his mind. He was brought back to Charenton, where he remained. On Friday in last week, that is, exactly three years after his last attack, death put an end to the misery of the unfortunate artist, and he was buried on Sunday in the cemetery of St.-Maurice. In the lucid intervals during his confinement, he was permitted to accompany a friend to Paris. There was only one object he

cared to see, and that was the Arc de l'Etoile in the Champs Elysées, which for some mysterious reason was always associated with his thought. When he was satisfied with gazing on the structure, he always quietly returned to captivity. GILL was only forty-five at his death.

It will be seen from the report which is printed on another page, that Mr. PEARSON's plans for the restoration of Westminster Hall have been adopted with a few modifications. Many will be surprised with the decision. What it amounts to is that the Houses of Parliament will appear to be extended in a different style, for which there will be no apparent reason. The rational procedure would be to complete Sir CHARLES BARRY's design in the way he proposed. It is evident that there must be much in favour of that design when we find the Committee stating "that the plan which they recommend would not be a bar to the adoption of Sir C. BARRY's plan, should it be found desirable at any future time to complete that plan, though some modification of it might be required." But from experience of governmental departments, it is hopeless to expect the arrival of that day. There is a site now which could be utilised with advantage, but when the new buildings are erected one for any additional government offices which may be needed will have to be found elsewhere at enormous cost.

THE conclusions proposed by Mr. DICK PEDDIE, who represented architecture on the Committee, deserve to be placed on record, although they did not find more than one supporter beside himself. They are as follows:—(1) That Mr. PEARSON's designs for the west side of the Hall have been shown to be without claim to be regarded as a restoration; (2) That the erection of the proposed buildings would detract from the architectural effect of the Hall, and of the whole mass of buildings of which it forms part, and would destroy or shut out from view some of the most striking and interesting features of the Hall; (3) That even the preservation and opening-up to view of the old Norman masonry on the west side of the Hall, which has been represented as one of the chief motives of the design, would not be so well secured by the erection of the proposed buildings as by that of a one-storey cloister or pent-house, forming a gallery along the side of the wall, inasmuch as the old wall, if it is to form one side of a series of committee or conference rooms, must either be left exposed, and so be liable to injury from necessary frequent brushing, or be covered up with a panelled dado and arras, as suggested by Mr. PEARSON, and therefore be very partially and imperfectly seen; (4) That there is no present need for the accommodation which the designs provide; (5) That that accommodation is in itself of an unsatisfactory kind; and (6) That the carrying out of the designs might put an obstacle in the way of providing at some future time, when it may become needed, really useful accommodation.

WOULD it not be possible to obtain another work by RAPHAEL at a cheaper rate than was paid for the Marlborough picture? According to Sir F. W. BURTON, a communication was received in August last from the British Embassy at Madrid, stating that certain documents would shortly be forwarded to the National Gallery Board, authorising the formal delivery of the picture known as the *Colonna*, RAPHAEL, to the Marquis FORTUNATO, the acting representative of the ex-King of Naples, to whom the picture had been bequeathed by the Duke DI RIPALDA. Before these papers could be transmitted, the Marquis FORTUNATO died, and thus the delivery of the picture has been further delayed. But although it still remains deposited in the building, the trustees and director incur no responsibility for its safety.

LOVERS of old silver plate have an opportunity of seeing an interesting private collection of 119 pieces at Mr. PAGE'S in Great Portland Street. It is not for sale. The forms are not always satisfactory; but a beaker of 1589, and one still more remarkable of 1533, a tea-caddy of 1713, a tankard of 1704, and several Apostle and seal spoons will satisfy the most critical. So much use is made of old plate from time to time in pictures, that the exhibition is one which painters should not miss.

## PAINTING AT THE ROYAL ACADEMY.

PUBLIC opinion has already decided that this year's Academy exhibition is excellent, and for once that most fallible of authorities is right. Although it would be difficult to point out any single work of supreme interest, and there is no picture that will sustain repeated studying like the President's *Cymon and Iphigenia* of last year, the pictures are more interesting as a whole than those which have been seen for several seasons. But if the exhibition is a success it is owing mainly to the younger artists. Never before have Academicians laboured so zealously to keep the exhibition at a level below mediocrity. The members of the French Academy of Painting and Sculpture, as we were informed lately in *The Architect*, excluded deserving men on the ground that they might disturb the equilibrium of the institution, and it is now evident our Royal Academy also possesses painters who are believers in that quality. Whether they paint animals, single figures, portraits, landscapes, or what POLONIUS calls "tragical-comical-historical-pastoral" scenes from the Bible, they support each other in preserving equilibrium—but it is one that is more suggestive of the Slough of Despond than of low water. It is, perhaps, unavoidable that painters, like actors, will ignore the time when they begin to lag superfluous, and allowance might be made if there were only a few works which testified to failing eyes and hands. This year, however, it is painfully evident that the ill effects of prescriptive rights are extending, for we see that painters who continue to be as capable as ever of producing good work have suddenly become careless, as if they considered they also had a right to share in the corporate prestige which is the unearned increment of English art.

It may be premised that the alterations in the galleries are advantageous. Water-colour drawings are now found in the room that is handsomest and best lighted, while the engravings, with drawings in monochrome, have a special room adjoining. The assignment of the old water-colour gallery to cabinet works not only allows of more justice being done to the artists than when large and small pictures are hung together; but, if one may judge by the crowds who linger there, it has created a new source of attraction for the exhibition.

The President is eager to foster works of a decorative kind, but there are not many of them in the exhibition. Sir FREDERICK LEIGHTON'S frieze, *Music*, is intended as a companion to *The Dance*, which was exhibited a couple of years ago. It is for a London mansion, of which Mr. AITCHISON is architect, and will be placed in a higher position than it now occupies. If the groups are judged singly, they seem more pleasing than taken as parts of a whole. Unity is as requisite in a decorative work as in a small easel picture, and there is more of it in the frieze for the same house by Mr. W. E. F. BRITTEN (No. 766), which is, from the architect's point of view, the most important example of decorative work to be found in the exhibition. Mr. ALBERT MOORE, from whom so much was at one time anticipated, has only a small nude figure, *White Hydrangea*; but the woman is too conscious of her contours to be employed for a subject of decoration. Mr. POYNTER'S *Diadumene* approaches decoration if it were only on account of the elaborate background, which is so full of detail that at a distance it seems a collection of conventional figures. There are several works which suggest that all we want is patronage for decorative works and the artists can be found. The able and pathetic figure of *Eve*, who is seen wringing her hands in remorse after she has learnt how little has been gained by her disobedience, denotes in its beauty of line a power that is available for ideal work. It is by Mrs. A. L. MERRITT. The *Bridal Eve*, by Mr. HERBERT GANDY, is a poetic rendering of a subject that has been made commonplace by painters. The bride and her attendants belong to no time or country, and the whole arrangement is as imaginative as if the picture had TITANIA for its subject. Mr. ALMA TADEMA, it is needless to say, could, if he cared, produce decoration that would satisfy the most exacting. The outstretched arm of the figure holding the scroll in *A Reading from Homer* might be compared with one of the Sistine sybils. The *Procession of Aphrodite*, by Mr. F. H. JACKSON, is also a proof of aptitude.

Historical painting in the old sense of the term is hardly

better represented than imaginative painting. The style invented by Mr. ORCHARDSON has superseded the usual mode of treatment. It is risky now to depend on antique costume and properties. A few years ago the collection of dolls which Mr. FRITH expects the public to suppose represents *John Knox at Holyrood*, might have been overlooked; at present it excites amazement. It will not do to imitate Mr. ORCHARDSON'S historical method; but who is capable of evolving one that will compete with his? Mr. WYNFIELD, in his *Royal Fugitive*, has adopted so much of the method as consists in leaving a wide interval between the figures, for CHARLES is placed at one end of a long table far away from the guests, but his former historical pictures were as effective. Mr. PETTIE appears to be one of the few artists who can paint history with dramatic vigour; this year, however, he relies mainly on portraits. And yet it must be said that Mr. ORCHARDSON'S *Salon of Madame Récamier* does not tell its story plainly. We have not before us a hostess who is the life of a brilliant society, and whose "flashes of silence" were like the open spaces in the artist's pictures, a means to give relief to something else. The lady is seated in a graceful attitude, but her thoughts appear to be far away from her guests, while several of the latter gaze upon her dolefully as if she were doomed. CUVIER is the most characteristic of the figures, for he contemplates Madame with the supercilious air of a connoisseur in physiology. Is it not time, however, for the artist to attempt some other colour for his backgrounds? The walls are in this case varied by a fine red *portière*, but we should have liked to see a departure from the light colour which Mr. ORCHARDSON adopts, no matter where his scene takes place. Mr. PHIL MORRIS, in his *First Prince of Wales*, paints so fine a figure of King EDWARD I. holding the baby in the hollow of his shield, that we hope to see him grapple with historical scenes. Mr. MAYNARD BROWN'S *Zenobia* is deserving of mention as one of the most important of the historical pictures. It tells the story well without being theatrical, and the grouping is admirably arranged. The picture by Mr. YEAMES, *Prisoners of War*, is entitled to come under this class. It is the best work we have had of late from the artist, and at the present time it will appeal to popular sympathy. It is, however, open to the fault that is so common with English painters when they represent foreign scenes. It is over-emphasised. Two midshipmen have been taken prisoners, and it is suggested by the file of soldiers in the distance and the crowd around, that it has required the expenditure of enormous power to place them in that position. One girl appeals for them, but the people, including sailors, are indifferent, and a priest, if one may judge by his looks, wishes to have the heretics guillotined forthwith. In spite of the insular bravado which artists have inherited from HOGARTH, who knew France from a single visit, the picture, as a piece of story-telling which the world can understand, is capital, and the colouring, with the exception of the harbour, is judicious.

It is difficult to decide with a picture like the latter whether it should be classed with historical or with incident pictures, and the same may be said of many other works in the gallery. Sometimes it is only a question of name. What, for example, is Mr. HODGSON'S large picture *Don Quixote and the Galley Slaves*? The knight is as much historical as the CID or BAYARD. This year painters have been equally afraid to turn to novels as to histories. Mr. HODGSON, like all men who write or discourse much on art, is hampered by fastidiousness, and does not do himself justice. He is a professor, and feels that much is expected from him, and must keep his door barred against that delightful *insouciance* to which so many immortal pictures owe their origin. Mr. BOUGHTON, in his *Milton Visited by Andrew Marvell*, has perhaps more reason to be called historical. It is certainly dramatic without exaggeration. The tremulous earnestness with which MILTON clasps the hand of MARVELL, who was of his brotherhood as a Puritan and a poet, gives reality to the picture and excites a wish for more of a similar kind.

Incident without apparent aid from books has abundant examples this year. One of the first to be found is Mr. STONE'S *Gambler's Wife*, in which the gambling takes place on a lawn after a game of bowls, while the young wife sits disconsolate under a tree, with nurse and child playing on

a terrace above. It is charming as a bit of genteel tragedy. The trunk of the tree, however, spoils all, for it seems to have been copied from some photographer's "properties." There is a superfine air about Mr. STONE's pictures, as if they were produced by perfumed paints, and it is well worth while to compare the gamblers with a glorious bit of comedy in the third room, *The Cupid's Spell*, by Mr. WOODS. Here we see the VAN HAANEN influence at its best. The picture is an out-of-doors scene, and very few around will be found to excel it in planning. The subject is only a Venetian girl spinning, while a fisherman gazes at her with ardour. It is the old story—the *belle dame sans merci* has him in thrall. The scene is laid on a high bank over the sea near a figure of CUPID, and the man's nets have been thrown to dry on the pedestal of the statue. Wild vegetation forms an arch above the pair, and in the distance we see Venice. The picture sparkles with colour and life, and will excite a desire in a good many artists to draw inspiration from a like source. A second example of the sunny south and the new school is Mr. FILDES' *Venetians*. Here, again, is low life. The artist takes a wine-shop for his background. A couple of girls have come to the canal. They are dressed in cottons, of colours that would be called barbarous. One, who is dark, is supposed to be washing, and is too lazy to draw the cloth from the water. The other, a blonde, has a water-jar of the frightful green seen in Italy, and is bedizening herself with vulgar finery. Above, women and children pass, and two men are playing cards. Mr. FILDES has gone out of his way to defy the laws of harmonious contrasts, and even puts green on blue. But the colours merely serve as foils for the beauty of the faces. We have a bit of Venetian life rendered with the joyousness of a summer's day. A third picture should also be mentioned here, although it is a piece of architecture. What the other two pictures are in comparison with most of the former efforts to represent Venetians, Mr. LOGSDAIL's *Ca d'Oro* is in respect of Venice. It shows the building under a fierce light, when all the colours have assumed their pristine brilliancy. Perhaps it will be said that this picture also is vulgar; but the critics should overlook much for the vigour of the view. The new school may see things with an abnormal power of vision, but in a dead-and-alive age so much earnestness with such an enjoyment of colour are novelties. Mr. WEGUELIN's *Swing Feast* is another incident picture which is a token of fresh life. It may seem foolhardy to cope with Mr. ALMA TADEMA on his own ground, but, looking at this picture, it would be unwise to predict who is to have the victory in the course of a few years. Mr. ALMA TADEMA's figures are statuesque; if they had been in action it was suspended while they were being painted. Mr. WEGUELIN shows a couple of girls swinging and enjoying themselves. The details may not have the finish of the elder master, but the vivacity of the figures should make him look to his laurels. A scene from a somewhat later time is Mr. WATERHOUSE's *St. Eulalia*. The body of the martyr is seen lying on the ground, with the head towards the spectator and the arms rigid from extension on the cross. It is a difficult position, but we find none of the old Academic posturing. Snow is falling, doves are flying, and in the background we see the surprised people who are kept in the distance by the stolid Roman sentry. It is the kind of picture that by the slightest exaggeration would become a failure. An almost similar scene was described by Cardinal NEWMAN in his story of "Callista," and we venture to say that the painter vies with the great writer in uniting tenderness and reverence with beauty. Higher praise we could not give.

Mr. TOPHAM has this year gone to "Ivanhoe" for his subject, and the knight bending his lance at the feet of one of the ladies who are present at a tournament gives him an opportunity to display his power in painting the horse. It is a brilliant, many-coloured scene. Very different is the brilliancy of the *Water-Seller, Cairo*, a small picture by Mr. BRIDGMAN, of Paris, which will repay scrutiny as an example of delightful colour and character painting. An English scene, under very bright sunshine, is Mr. WELLS' *Quarrymen at Purbeck*, which suggests the fine field that awaits artists in subjects of the kind.

The portraits this year are in many styles. We are able to compare the methods of Sir F. LEIGHTON and Mr. MILLAIS in the portraits of the two little *Ladies Primrose*. One

suggests the aristocrat, the other the child. Mr. J. S. SARGENT has an Impressionist portrait of *Lady Playfair*, in which he appears to have seized a momentary expression. The hands are better than we have seen in other portraits by the painter, but the long thin line of the right arm looks rigid. Mr. HERKOMER has demonstrated in his portrait of *Miss Katharine Grant* that he is no less competent to paint beauty than sturdiness and character. Mr. ALMA TADEMA in *My Youngest Daughter* retains his specific style. Mr. HOLL is as vigorous as ever in his *Dr. Weir Mitchell*. The picture by Mr. J. D. LINTON, *The Marriage of H.R.H. the Duke of Albany*, is also a collection of portraits, and we suppose the same may be said of *The Ruling Passion*.

The President in his speech at the banquet called particular attention to the variety of landscapes which will be found in the galleries, and here again we find admirable works by young painters; but our notice has already reached a length that may be considered wearisome. The visitor this year will discover in every room more than one landscape which upholds the reputation of the English school.

## ARCHITECTURE AT THE ROYAL ACADEMY.—II.

IT is satisfactory to find that English architects occasionally obtain continental commissions. *Françon, Biarritz*, by Messrs. SALOMONS & WORNUM is an example. If English furniture is becoming fashionable abroad why should not English houses be erected to be in keeping with it? Near the drawing are Mr. E. G. HARDY's three sketches of fonts in Siena, but in a style that has never found favour with the English clergy. Then we see some carefully executed drawings of the church of St. Mary, Madley, Herefordshire, by Mr. F. R. KEMPSON. Mr. KNILL FREEMAN has a small view of a part of the chancel of St. Mary, Worsley, which is so picturesque in detail that it might pass for old work.

We now come to the longest wall. Mr. J. N. JOHNSTON's *Wyburn Grange* loses much of its merit through the weakness of the drawing, of which parts seem like the work of a schoolboy. What draughtsmanship can do may be seen by comparing it with the vigorous sketch of *The Roughters*, by Mr. LANDSELL. Mr. ASTON WEBB's *Alfrick Church*, of which there are two views, is marked by much severity, and, as a restoration, has none of the modern features which are obnoxious in Buckingham Street. Mr. LACEY's *Roadside Inn at Ealing* manifests an endeavour to be picturesque without exactly knowing the right way to attain that end. Mr. T. G. JACKSON's *Brighton College* is a good building, well suited to its purpose, but the drawings are unsatisfactory, and appear to have been completed by an artist who was not clear about the nature of things he had to represent. Mr. MILLARD has a modest but pleasing *Artist's Home*, shown in a very good water-colour sketch. One of the most important drawings in the room is *The Principal Entrance, Constitutional Club*, by Mr. EDIS. As a work of architecture, it enforces unstinted praise. There is only a part of the building to be seen, but it is plain that the detail has been thought out in an artistic spirit, and that colour and form were regarded with equal care. A full-size design for a *Silver Sconce* is by Mr. LETHABY, by whom there is also a drawing of the porch at Chartres. It is a novelty to find a work of Mr. COAD's in the Academy. The woodwork in the two interior views of *Lanhydrock* is skilfully designed. It is plain that the architect was not restrained by parsimony in his client, but the ornamental carving is not excessive in quantity, and is found in its right place. Mr. FERGUSON has several boldly drawn sketches of Naworth Castle, mounted in two frames. Less stable in style of construction is the *Temple of To-Shogun*, which, with two other drawings of a similar kind, have been sent from Tokio by Mr. J. CONDER. The water-colour drawings are striking, but the architecture of Japan is too fantastic, if judged by Western rules. Messrs. BELCHER have a view of the *Premises in Wood Street*. As a grotesque caricature of DÜRER, it may move people to smile, but great as "go" may be, the simpler drawing lately reproduced in *The Architect* would have given visitors a better notion of Messrs. BELCHER's intentions and ability. Carlisle

is not a city where one expects to find attractive houses, and the more credit is to be given to Mr. G. D. OLIVER for his *Residence in Chatsworth Square*, which, with the solidity that befits so ancient a place, is graceful, and appears to be commodious. The church in Gordon Square, which Mr. JOHN BELCHER is completing, is represented by two vigorous drawings of the porch, tower, and spire. Mr. UNSWORTH'S *Warehouse, Star Yard*, is a rather grim-looking building, and suggests that the designer worked under widely different conditions from those which inspired his memorial tower. It is impossible to discern how much in the view of *Blickling Hall* represents Mr. ADAMS'S work as a restorer, but it is needless to say that the drawing is admirable from its lucidity and care. The two pencil views of *Westminster Hall*, showing Mr. PEARSON'S proposed restoration, should now be attractive if the public cared for architecture. Their appearance is most opportune. But from what we saw during the week, the new architectural room is supposed to subserve the same purpose as its predecessor, and to be a retreat from the crush. Some wise authorities say it is an advantage to take a holiday among people of whose language we are ignorant, for we are compelled to remain quiet, and it is probably for a similar reason that visitors sit in front of the architectural drawings. They are incomprehensible, and therefore for a time the attention can be unexcited.

The design for the *Brisbane Town Hall* by Messrs. LEEMING & LEEMING has disappointed people, who appear to think that it is possible to produce a sumptuous building like the War Office even when there is no exchequer to supply funds for its erection. There is a good deal of temperance shown in the treatment of Classic features, but the dome does not enhance the effect. As is usual in such cases, it is suggestive of poverty, for if a dome is indispensable it should be on a scale commensurate with its importance. It is not wise to have a building expressing the principle of "fain would but could not," and nothing does this more emphatically than a cheap dome. The water-colour by Mr. AITCHISON of the *General Office* in the building of the Royal Exchange Assurance Company is more suggestive of cosiness than is customary in places of the kind. Mr. BLOMFIELD has shown much skill in designing London churches with the restrictions of limited sites and frontage abutting on the street. Another proof is given by the *Church of St. John the Baptist, Great Marlborough Street*, in which provision is made for plenty of light, and the height of the tower is no more than is sufficient to give emphasis to the building. The *New Premises, Scarborough*, by Mr. E. BURGESS, is happily treated, and in a style that suits a fashionable resort. Mr. JAMES BROOKS has two churches in the exhibition, which show a master hand. An exterior view is given of *St. Augustine's, Highgate*, with the low plain brick wall of nave extending along the street. The whole building is well proportioned, and, although all churches nowadays appear to depend on limited funds for their existence, in this case there is nothing to suggest an omission of an important feature, as too often happens. *St. John Baptist, Kensington*, is an interior, and its loftiness and richness are worthy of a more liberal age.

Recent competitions have not supplied the room with many drawings. There is one of the many designs sent in for the Exchange at Amsterdam. It is by Mr. SULMAN, and has been inspired by the *genus loci*. Mr. WIMPERIS, in his *Audley Mansions*, gives another example of his successful treatment of West End houses. Mr. BRYDEN'S *Entrance Gable, St. Peter's Hospital*, is a telling work, without any effort to gain effect by sacrificing strength. Mr. MARVIN has a couple of drawings: one is a fragment from a design for the Government offices, showing a court and tower full of character, while the second also shows a corner with flats and offices in a similar style. Mr. T. J. JACKSON'S *House at Kensington Court* is expressive of a desire to make the most of the height of the building in the expression of the vertical lines. Mr. EDIS'S *Badminton Club*, in Piccadilly, is a building approaching completion. The design is well suited to the position, for, as importance is attached to the view, the balconies are carried across between the windows on the different storeys so as to accommodate a great number of members on special occasions. This is a new idea in club architecture, and is sure

to find favour. The balconies are preferable to temporary staging, without affecting injuriously the appearance of the building. Mr. EDWARD HODKINSON, in his *Proposal for New Street Building*, departs from stereotyped arrangements, and shows a massive block with arches below. The drawing is excellent. An example of street architecture which has been realised is Mr. SHERRIN'S *Cannon Street Buildings*. In the drawing the shops are not shown, and this gives strength to the base of the design; but as it is in pen and ink it cannot express the agreeable contrast which is afforded by the red-brick front and stone columns on the various floors. The building is one of the best of those lately erected in the City, but the gilt mouldings, which have been placed around the windows, are not an improvement. The design for the *Cambridge University Laboratory* we like better than most of Mr. STEVENSON'S works. It has more of a permanent character in its appearance than his houses. The use made of coupled columns and rustication is indicative of a nearer approach towards Italian; and in this Mr. STEVENSON does not stand alone. It is a recognition of their position when we find that Messrs. CAMPBELL & SMITH have been asked to prepare a design for the decoration of the library in the Bank of England. The style adopted could hardly be more Classical in the details if the design had been produced in Berlin. The artists' learning and judgment are deserving of recognition. Mr. J. L. BALL'S orphanage is small but well grouped, and the same may be said of Mr. MITCHELL'S *Workmen's Club, Edinburgh*, in which a good position has been well utilised. The *Nicholl's Hospital, Manchester*, is one of the important buildings in that city. The view in the Academy does not show its extent, but gives an idea of the capital tower in the centre of the façade. The design for the *Yarmouth Town Hall*, by Mr. NATTRESS, possesses an elegance and finesse which well merited a premium, but it is not improbable that on account of those qualities it was set aside from the first place.

The *New Stable Offices, Ingestre Hall*, is an effective drawing by Mr. OAKLEY of a meritorious collection of buildings of which Mr. JOHN BIRCH is the architect. Another fine example of draughtsmanship is seen in Mr. S. J. NEWMAN'S *Bishop Fox's Chantry*, but we should have preferred to see his pen employed on buildings of his own. Mr. MERVYN MACARTNEY'S country houses are always attractive. This year he has three, of which the best is *Court Hayes, Oxted*.

When we come to the last of the walls, we find the *Suggestions for the Decoration of St. Paul's*, by Mr. ARMITAGE, R.A. It is a pity that the drawing which shows the dome is only in outline, for in a case of the kind much depends on colour. Mr. ARMITAGE, it will be remembered, painted some of the figures in the *Hemicycle* for DELAROCHE, and out of love for art has painted the walls of humble churches in London. What he proposes therefore for St. Paul's is not the sudden inspiration of a novice in art. The "Te Deum" is the subject selected for illustration. The drum is divided into four sections, and is filled with figures representative of apostles, prophets, martyrs, and the Church in general, on a golden ground. Figures in the niches symbolise the Seven Churches. So far the work is easy. It is when the dome itself is reached that the true difficulty is found. Mr. ARMITAGE believes in a light ground, and proposes that a silvery grey should be used. The Elders are seated at the base, and groups of flying angels are seen above. There is no formal arrangement of ribs and circles, and the decoration will accordingly be declared to want architectural character. But there is as much to be said in favour of the proposal as against it, and Mr. ARMITAGE would do well to work out a sketch in colour. If the dome can be made to suggest the immeasurable heavens when they break open to the highest, much would be gained; but if it is only a sort of scenic display that is possible, then a conventional empyrean would be preferable, or even figures that are not of a supramundane character. The drawing in the Academy is interesting; but as it evades the crucial test of colour it can hardly exercise the influence on the controversy which Mr. ARMITAGE'S position should warrant.

On the same wall there are a few other designs which cannot be overlooked. The remarkable cylindrical hospitals by Sir ANDREW CLARKE and Mr. INGRESS BELL recall the

engravings of the dwellings of the termite ants which are seen in books on natural history. The fine drawing, by Mr. BREWER, of Messrs. HADFIELD'S *Corn Exchange Buildings in Sheffield* has been reproduced in this journal. But the vapours of the town have made the colour of the brickwork look very different from what it appears in the view. Mr. A. E. STREET has a sheet of various designs, which are in excellent style. Lastly we have the *Drumsheugh Baths*, Edinburgh, by Mr. J. J. BURNET, which are amply delineated.

### SIR F. LEIGHTON ON THE ROYAL ACADEMY.

THE duty of proposing the toast of prosperity to the Royal Academy and the health of the President was at the banquet on Saturday entrusted to the Master of the Rolls, who described Sir Frederick Leighton as "the most ardent, sympathetic, and careful teacher of the younger members of his profession and guardian of their interests who had ever sat in the chair he now adorned."

The President in reply said:—The Master of the Rolls has in graceful words asked you to drink prosperity to the Royal Academy and health to its members, and you have responded to his words with a very gratifying cordiality. For that proposal and for that response I offer to him and to you the sincere thanks of the body for which I am privileged to speak. I am embarrassed by the kind words which your indulgence has permitted the Master of the Rolls to use of myself, and the remark which they suggest to me is that the right hon. and learned gentleman is truly an artist in words. Until within a very few days I had nourished a bright hope—I had hoped that no funeral note would jar to-night on the festive key which belongs to such gatherings as these, and that I could have shown you the ranks of the Royal Academy intact and unbroken since the day when last I responded to this toast. In this hope I have been deceived, and we have now to deplore the recent loss of a valued colleague, whose works were well and widely known in this country, more especially among those to whom the hillside and the moor are dear—I mean Richard Ansdell. His once untiring hand has ceased to labour. His memory will live in the esteem of many friends. Meanwhile another hope has found fulfilment. At last we are enabled to redeem our long-given pledge that every inch of ground subject to our control should be laid under contribution for the widening of our area of exhibition, and for the increase of its dignity, for the advantage of artists, and for the public convenience. That pledge is now made good, and the furthest limits of our power of expansion are reached. We throw open to you to-day, and on Monday to the public, an exhibition enlarged by three new galleries, and containing 278 more works than have ever been seen together under this roof. Some 140 more artists are among the successful contributors—that is, 140 more anxious minds have been relieved; and although in the conduct of such an exhibition as this the Council of Selection must needs close its heart to personal motives of every kind, none of us have risen—let me rather say none of us have fallen—to that frame of mind in which the poignant anxieties of our brother artists could be to us a matter of indifference. But it is not in numbers alone that our exhibition has gained; it has gained in artistic decorum. The unavoidable but unseemly jumble in which till now works the most heterogeneous have been thrown together has yielded to a more decent order. The architects at last open out their schemes in a well-lit room and region all their own. Water-colour and pastel are seen in what I cannot but think the most becoming gallery in this building. And, lastly, art in monochrome not only has its own domains, but, as far as the accidental proportion of material admits, its various classes are kept apart and distinct, much assuredly to their individual advantage and to the better adornment of the room. These, then, are the gains which we achieve; and yet, already thus early, our satisfaction is not without alloy. Great as is the increase in our wall space—and we reflect with some disquietude that this increase is final—the hopes and the energies of the artists of this country have more than kept pace with it, and we have found ourselves this year face to face with a number of contributions absolutely without precedent. Not fewer than 9,010 works of various kinds have been submitted to the members of council, and by them sifted, with the result before you. I cannot conceal from myself that even now our widely enlarged hospitality omits, without fault of their own, but to our regret, not a few meritorious works to which we should gladly have extended it. This admission, scanty as is, I fear, its consolation, was yet due to those for whom less has been done than we could have wished, or than they have deserved. And what, apart from numbers, is the character and calibre of this exhibition? I think that it
